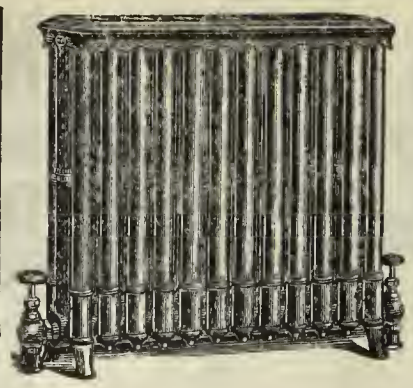
The work is handsomely presented in a volume of 288 pages in the form of a handy reference book, with many illustrations, showing the several ideas and methods of heating, ventilation and economical arrangement of pipes and radiators, &c. The very complete specifications of materials which accompany several of the essays give a value to the work that will be understood and appreciated by the architect and builder who aim for excellence in this branch of house building."—*The National Builder.*

JAMES SQUIRE, *Youngstown, Ohio.*—"If we had only had the information contained in this volume in earlier life, we could now have dollars where we only have buttons."



407 pages, 7 x 9½ inches. Handsomely bound in cloth. One volume.

PRICE, $3.00.

SECOND EDITION.

KITCHEN BOILER CONNECTIONS.

A SELECTION OF

Practical Letters and Articles Relating to Water Backs and Range Boilers.

Compiled from THE METAL WORKER.

71 Illustrations, 8vo, 140 Pages, Cloth, Price, $1.00

The book is well got up and the information well given. Those interested in works of this character will do well in buying it.—*The Plumber and Decorator.*

The Metal Worker produces in this volume a number of queries, with answers thereto, which have appeared in that paper. It will be seen that *any plumber who is troubled to make boilers work satisfactorily will here find his troubles alleviated. It contains numerous illustrations and throughout is highly practical from the standpoint of the plumber.* It contains a table of contents and an index.—*Scientific American.*

The publisher of this work is well known for his former successful efforts in the publication of useful and thoroughly practical books for metal workers and steam fitters The book before us is a model of its kind in judicious compilation, practical instruction, neat illustrations and general typographical appearance.—*The Master Steam Fitter.*

Can be considered an authority on the subject to which it relates.—*American Engineering.*

The book is a practical helper to every member of the plumbing trade, who, being alive to his own interests, should embrace this opportunity to obtain the valuable instruction in which the work abounds.—*New England Stove, Hardware and House Furnisher.*

A well bound, well printed, well illustrated and well edited book. . . The special field of this work is very thoroughly covered. . . Abounding in rare technical information of a practical character. *American Artisan.*

Nearly every problem is illustrated fully and this interesting question of water back connections will be found to be quite fully treated in the volume.—*Domestic Engineering.*

Both interesting and instructive to our trade. It shows how mistakes are apt to arise and how they may be overcome.—*Plumbers' Trade Journal.*

TO OUR FRIENDS AND THE TRADE.

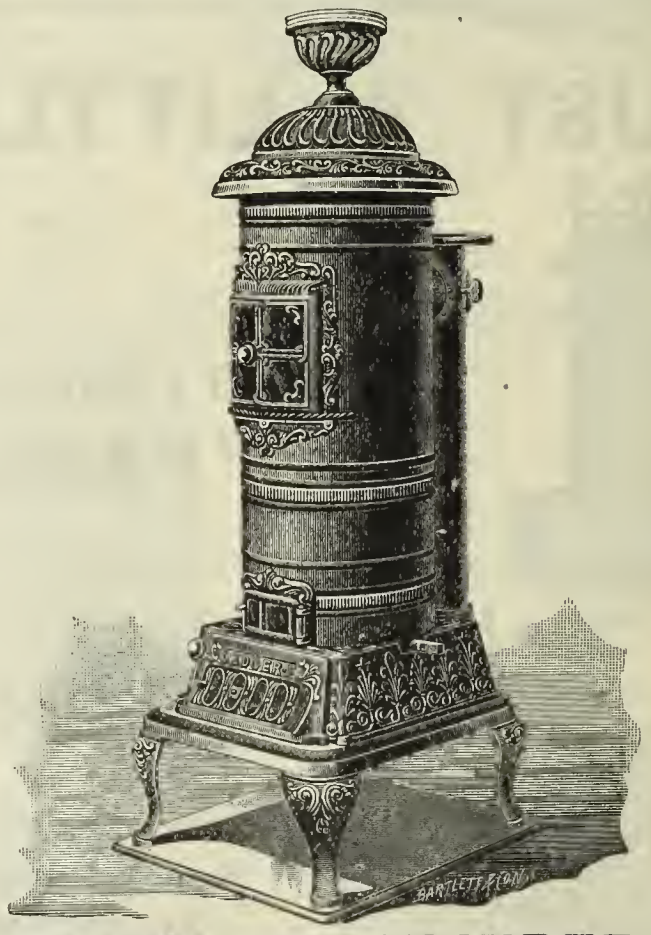
The warning published in the last issue of THE METAL WORKER shows how much the "combine," who unreasonably claim that they are the only ones who have the right to build certain gasoline stoves, are afraid of us.

We have for years carefully studied the patents that certain parties claim we infringed, and also all other vapor stoves, and we are prepared to substantiate our claim that we do not infringe the patent of any one.

We are manufacturing under our own patents. We claim that every evaporating stove manufactured infringes our Kitson Patent No. 385,673, and we propose that every infringer shall sooner or later have ample opportunity to contest our claims if he sees fit.

We hereby warn every one not to buy anything except L. & H. process stoves unless they are prepared to pay us royalties under that patent.

A. J. LINDEMANN & HOVERSON CO., Milwaukee, Wis.



An Up-to-Date Residence.

Jarvis Edson, a New York City manufacturer, has just completed a new residence for himself uptown, which embraces a number of modern features not commonly found in an ordinary private dwelling house. In the basement is installed a double engine, such as are found in ocean-going steamers. This will generate electricity, which will be used for heating and illuminating the house. Electricity will do the cooking in the kitchen, which is on top of the house. The kitchen is equipped with aluminum utensils. The engine will also operate a refrigerating or cold system, which in the summer will extend all over the house. Electric bells, electric dumb-waiters, an electric passenger elevator and electric ventilating fans are among the comforts provided. The roof of the house has been arranged for a summer garden, and will be illuminated during the season.

— IN NO VERY GREAT HURRY.—A good story is told of a lazy and loquacious farmer whose farm lies just outside Worcester. He called at a neighbor's house recently. "Sit down, sit down!" exclaimed the neighbor. "I don't know as I ought," replied the farmer; but nevertheless he sat down. After some talk about the crops and the value of an adjoining piece of ground the farmer said, slowly: "I don't know as I ought to be sitting here. I came over to see if I could get a ladder; our house is afire!"—*London Weekly Telegraph.*

— TOM BIGBEE: "I believe the president of this road, when he was a boy, sold candy on the trains."

Uncle Oatcake: "You don't say so! They do charge high for the candy, but I hardly thought there was so much money in the business as that!"—*Exchange.*

LEDGER F CYLINDER.

WITH REVERTIBLE FLUE. No. 9, No. 10, No. 12, No. 14.

Well made, attractive in appearance and attractive in price. Made both as a plain cylinder and with revertible flue as above. Circulars and prices are worth seeing. Send for them.

MICA

IS THE BEST.

The F. E. BELDEN MICA MINING CO.,

12 Broad St., Boston, Mass.

— It is said to be an old story, this of a man named Doherty, who was drilling with his squad of recruits in London. Doherty was 6 feet 2 in hight, and at that time the sergeant-major was a man whose hight was only 5 feet 4. On this day he approached the squad looking sharply about him for some fault to find.

All the men squared up except Doherty and the sergeant-major at once accosted him.

"Head up, there, man!" called he. Doherty raised his head slightly.

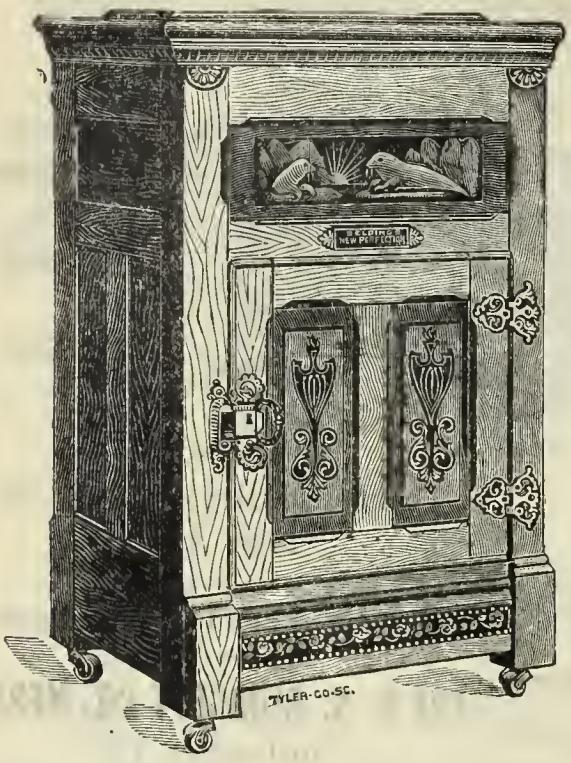
"Up higher, sir!"

The head was raised again. Then the sergeant major managed, by standing on his toes, to reach Doherty's chin, and he poked it higher, with the remark:

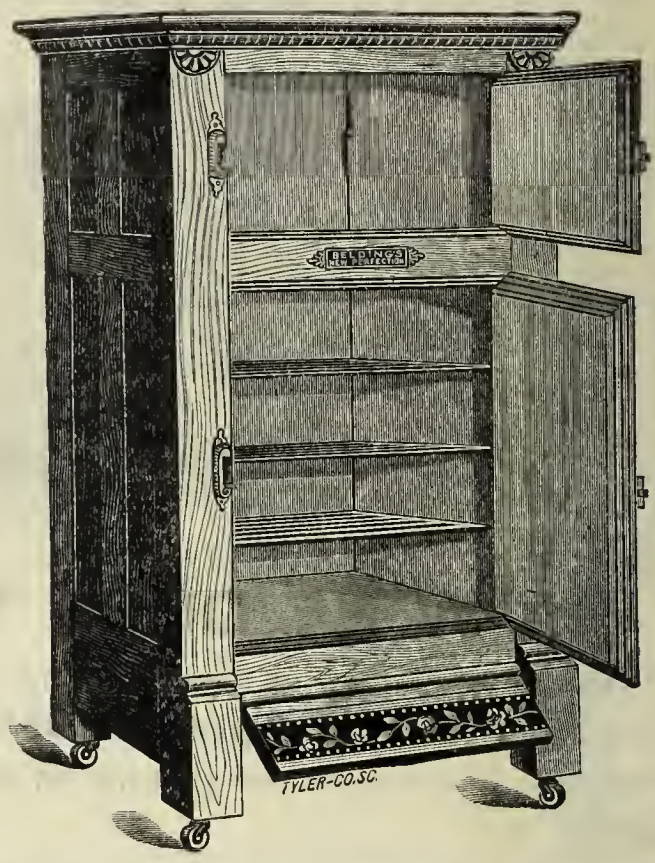
"That's better. Don't let me see your head down again."

By this time everybody was interested at seeing Doherty staring away above the sergeant major's head, when a voice from above said in a rich brogue:

"Am I always to be like this, sergeant-major?"



"Yes, sir."



"Then I'll say good bye to ye, sergeant-major, for I'll never see yez again."—*Exchange.*

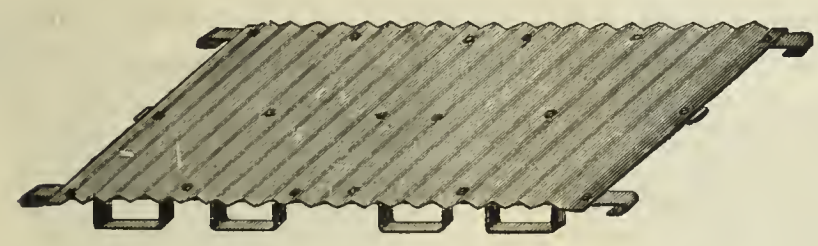
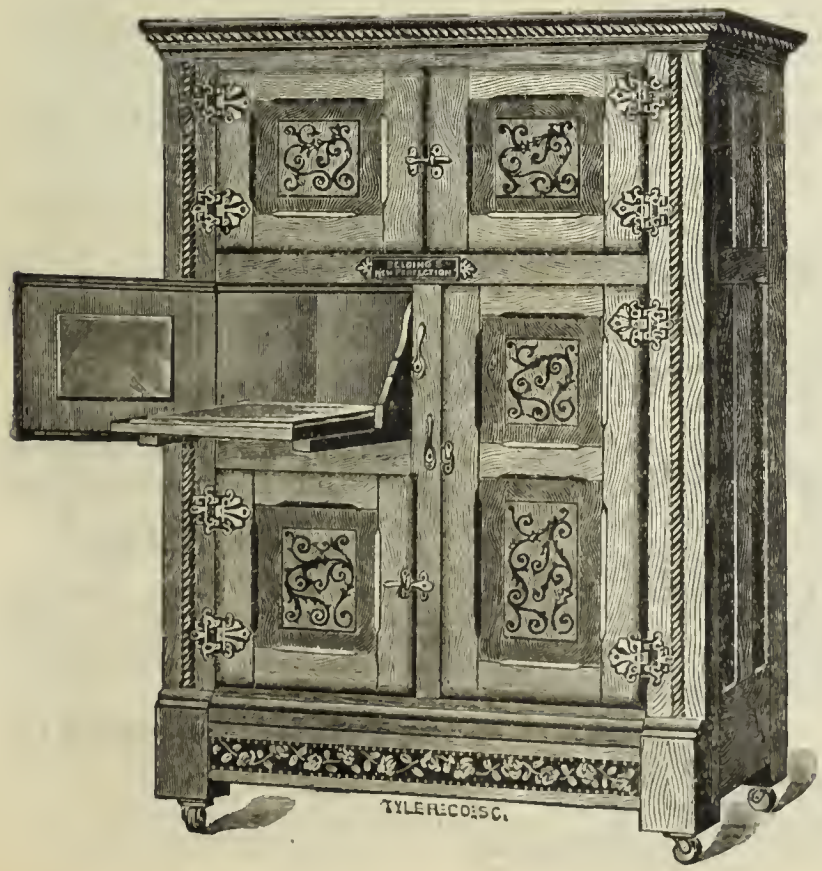
OUR NEW AUTOMATIC COLD AIR DAMPER ATTACHMENTS.



This cut shows a section of our Refrigerator with the New Automatic Cold Air Damper closed.

A—Represents Metal Ice Rack.
B—Bottom of Ice Compartment.
D—The **New Automatic Cold Air Damper.**
E—Door of Provision Chamber.

When the door of the Provision Chamber is opened the Cold Air Damper *immediately* closes the opening through which the cold air drops, thereby *instantly stopping the circulation* in the Refrigerator. Then, as the cold air in the Ice Compartment *cannot escape*, it is impossible for warm air to enter it through the flues in the sides of the Refrigerator; therefore, while the door of the Provision Chamber is open *no ice is wasted, no cold air escapes* and *no warm air enters* the Ice Compartment or *comes in contact with the ice.*



Thus it is clearly shown that this improvement is a *practical* one and makes our Refrigerators *consume less ice* than any that are now on the market.

OUR NEW DRIP CUP ATTACHMENT.

SOLID METAL ICE RACK.

No wood cleats to get water soaked and tainted.

All refrigerators **hardwood, antique finish.** We carry large stocks at all of the following places:

—THE—

Challenge Iceberg Refrigerators,

MANUFACTURED BY

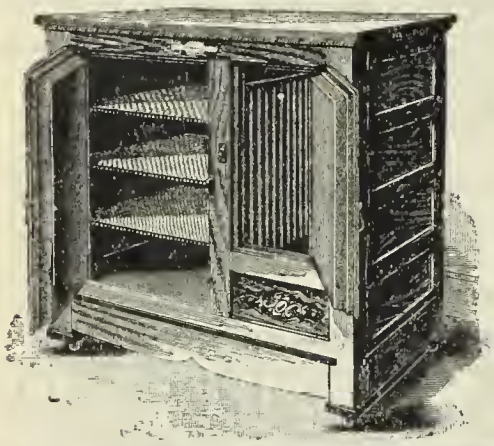
The Challenge Corn Planter Co.,

GRAND HAVEN, MICH., U. S. A.

Write for our large Illustrated Catalogue for 1895.

All our goods are made of thoroughly kiln dried ash, finished in antique with Shellac and coach varnish. Panels are beautifully hand carved. Trimmings are of solid bronze and are our own pattern. We use our own patent air tight locks, patent self-retaining malleable casters and floor plates, and patent drip cups All Refrigerators are filled with pure charcoal. The Challenge Iceberg Refrigerators are the best made for preserving all articles stored therein pure and sweet, as there is always a circulation of pure, dry, cold air. Refrigerators having water coolers are provided with bronze faucet and cup holder. All Sideboards have a fine beveled French plate mirror. We manufacture Refrigerators of all sizes from the ordinary Ice Chest to the largest sizes for grocers' and butchers' use, including the most elegant line of Dining Room Sideboard Refrigerators ever put on the market.

THE CHALLENGE ICEBERG,



THE .·. HONEST .·. RELIABLE .·. REFRIGERATORS,

SELL THE BEST.

The Automatic Refrigerator

has more good points and does better work than any other and for that reason is a better seller.

Our illustrated catalogue for 1895 tells all about the line. Its advantages are:

Perfect circulation.
Large condensing and purifying capacity.
It has no flues to cause it to smell bad.
The trap is inside where it cannot be misplaced or lost.
The drip pipe may he cleaned without disturbing anything in either chamber, and is entirely out of the way
It has nine walls to protect the ice and to maintain a uniform temperature in the cooling chamber.
It has woven wire provision shelves that are superior.
It has superior hardware.
It is more capacious and convenient.
Flavors of foods will not mix.
Last but not least, it's different, and will bring new customers and new trade.

We want the leading dealers to sell our goods and but one dealer in a place.
The goods are made of ash, and well finished.
We have two factories, one in the East and one in the West, and are able to take better care of your trade than if we had but one.

Building Trades Exhibition.

The International Building Trades Exhibition will be held this year in Royal Agricultural Hall, Islington, London, England, from March 25 to April 4. This exhibition is for the purpose of making a representative display of materials and appliances connected with the building trades. Among the subjects specially mentioned by the International Building Trades Exhibition Company of 222 Strand, London, W. C., are brick and tile making, iron work, pottery, terra cotta, wood work, ventilation, heating, sanitary ware, decoration and paving. We understand that all branches of the building trades in London are co operating in the movement, and it is expected that the display to be held in April next will prove as pronounced a success as the one last held under the auspices of the company named. The consultative council, consisting of men of high repute in the professional and manufacturing world, are taking special interest in this exhibition for the purpose of securing a greater development of trade in connection with the building industry.

Overcrowded New York.

The problem of overcrowding in the poorer quarters of great cities has long engaged the anxious attention of social economists and philanthropists throughout the civilized world. It is unfortunately one of which the difficulties seem to grow more intense year by year. This fact is strikingly illustrated in the report of the special citizens' committee recently engaged in an inquiry into the tenement houses of New York City. This report brings out some interesting and startling facts connected with the extraordinary growth in density of the city's population within recent years. Only a few years ago, before the general adoption of the "flat" system, the average number of residents to a house in New York City was 14. Now, the average has risen so high that, in some sections of the city, it has reached four times that figure. In the Tenth Ward, for example, the average is 57 persons to a house, while in the adjoining ward, the Seventh, the number is 43 to a house. The tremendous density of the city's population, more particularly on the east side of the town, is, of course, mainly due to the fact that, by improved modern methods of construction, builders have been enabled to utilize the available space much more profitably—to the owners and landlords—than formerly. Yet, taking into consideration the additional accommodation skyward thus provided, the actual accretion of population has far outstripped the enlarged accommodation.

Health and Morals.

The Tenth Ward of New York City, previously referred to, has, for instance, with an area of 110 acres, a total population of nearly 70,000. This is at the rate of about 636 persons to an acre, an average certainly in excess of any section of like size in any other city of the United States and an exhibition of crowding which is hardly to be rivaled in the world. The difficulty of securing and enforcing adequate sanitary measures under the conditions afforded by such a lamentable state of things as must exist among a community dwelling in such densely packed masses can be readily apprehended. That the sanitary laws of New York City are so well administered, and that the urban death rate is so comparatively favorable under these circumstances, speaks well for the city's health department. When, however, the moral aspects are regarded, of the herding together of human beings in such a manner, the situation of the masses in the thickly settled east side offers a problem which may well engage the most earnest and serious consideration of those to whom the future well-being of the race is in any degree a matter of solicitude.

Bids on Heating.

The steam or hot water heating contractor, in making up his estimates, naturally looks upon profit as an indispensable item; but he should not lose sight of the fact that the all important consideration is a careful and absolutely correct computation of the cost. The successful man in any line of business is he who never is deceived in the cost of any work for which he contracts. Long experience is often the only qualification that may be safely relied upon for calculating the cost where the work is difficult or its character precludes a perfect idea of the labor required being formed until the job is under way. In digging a pit for a boiler recently a spring was struck by the contractor, and, as a cast iron contract had been made, it cost more to dispose of the spring successfully than the entire price of the job, profit and all. Such things will occasionally be met, but in the majority of cases the only obstacle to a correct estimate of the cost being made is a want of care in making it up. It is a work that requires patience, a thorough acquaintance with the price of material and thorough practical knowledge of how the work should be done in order to foresee expensive details that would otherwise be overlooked. As a rule, too little time is given to making estimates. It is tedious work and not inviting to those who eagerly take part in the solicitation and sale. Few are ready and willing to go carefully over a cost calculation and the list of items to see if it is correct, or if anything has been omitted that should be included, and whether good judgment has been used in setting a price on the labor, cartage and incidentals. After this work has been carefully done, very few business men will omit to add a profit.

In a paper on prepayment gas meters recently read by Mr. Nasmyth before the Manchester Engineers' Association, the author states that the adoption of these meters in England has more than made up for the diminished gas consumption of those who have adopted the electric light. In Liverpool 12,000 of these prepayment meters are now in use. In London each meter is the means of selling from 10,000 feet to 20,000 feet of gas every year ; and in Croydon, by their means, the consumption of gas has increased 16,000,000 feet in a single year.

The marked decrease in immigration into the United States last year is illustrated by the report of the landing agent at Ellis Island, New York, which shows that during the year 1894 188,-164 steerage and 92,561 cabin passengers were landed at this port, the smallest number since 1878. The following table shows the total arrival of immigrants in the past ten years:

1885	395,346
1886	334,203
1887	490,109

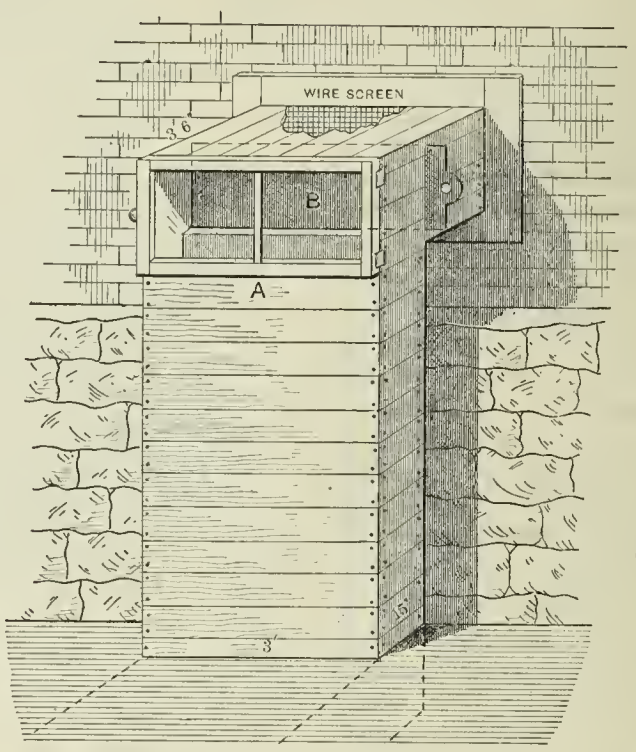
THE LETTER BOX.

Squaring the Circle.

From J. L. S., *Catasauqua, Pa.*—I send you herewith an account of how the circle is squared by M. Roche, Ph.D., of the Polytechnic Nautical and Mechanical College of Philadelphia. Given any circle to construct a square that shall be in area equal to it. Let a horizontal line be drawn tangent to the circle. Revolve the circle on its circumference until the original point of tangency touches the line again. Then will the distance between the two points be exactly equal to the circumference of the circle. Bisect this distance and draw a perpendicular equal to the radius of the circle and complete the rectangle, which will be exactly equal to the area of the circle, for it will be one-half of the circumference multiplied by one-half of the diameter. The description and the diagram, which is copyrighted, further shows how to change this rectangle into a square.

Note.—We are very glad to print this interesting communication showing that a mechanical method has been devised for approximating the area of a circle. We cannot, however, consider this a method of squaring the circle. Our correspondent, of course, is aware that a man might take a tape measure and measure the circumference of a circle and multiply it by one-quarter of its diameter and the result would be the area. The point is to solve it mathematically. We might say that to find the area of a circle it would only be necessary to cut a sheet of lead to its exact size, then remold it into a square, and measure the square. Or, take a lot of shot and squeeze them from the form of a circle into that of a rectangle. All of these methods are more or less approximate, but they do not come within the definition of squaring the circle. Our correspondent will readily perceive that with the relationship between the diameter and circumference known to over one hundred decimal places, there will be less error in calculating the area according to the old fashioned rule than there would be in applying a mechanical method such as here described.

From A. T. N.—I notice in *The Metal Worker* of January 19 that a reader wishes a method for squaring the circle. I have a book wherein Rufus Fuller, 255 Tremont street, Boston, Mass., claims to have discovered the exact relation between the diameter and circumference of the circle, which he says is as 1 is to $3\frac{3949}{27889}$; in other words, when the diameter of a circle is 1 inch the circumference is $3\frac{3949}{27889}$ inches.



Note.—This is an interesting statement that our correspondent furnishes, but unfortunately the fraction he gives does not agree with the approximate numbers that have been previously determined. The relation between the diameter and circumference is expressed by an indeterminate decimal which has been carried out, as we have stated, to over one hundred decimal places, beginning in this way 3.141592653589. If our correspondent will compare this with the fraction that he has quoted he will find that after the fifth decimal place the two do not agree, so we fear the fraction is not correct. The commonest fraction is $\frac{22}{7}$. This agrees for two decimal places and is near enough for many practical purposes.

Since the above was written we have received a letter from E. M. Lang & Co., Portland, Me., referring likewise to the book of Rufus Fuller and giving his rules as they appear. The first is the same as the one above quoted, while the second one reads as follows: "Multiply the given diameter of the circle by 148, divide the product by 167, and the quotient is the length of one side of the square that contains the same area as the circle." This, however, is simply another way of putting the former statement, and consequently contains the same error.

A Cold Air Duct.

From J. L., *Pittsburgh, Pa.*—I send you a sketch of a combination cold air duct and light shaft, which can be connected with the same window and supply a furnace with air and the cellar with light. I trust it may be of some value to the readers of *The Metal Worker*. The duct is made of matched flooring boards, with a sash hinged at the top in the same manner as a transom, as shown by A of the sketch. If under the influence of some winds the hot air is inclined to be discharged out of the cold air duct, the sash door at A can be opened and the slide shown at B kept shut, preventing the escape of hot air and providing for a cold air supply to be taken from the cellar until the wind changes. I would like some of the readers of *The Metal Worker* to suggest a plan for an air filter for such a duct; also give the name and address of some manufacturer of such an apparatus.

Note.—We should be glad to have our readers contribute anything that they have tested for filtering air. In *The Metal Worker* of October 28, 1893, such an apparatus was described, the Farquhar Heating Company, 61 Dearborn street, Chicago, Ill., making an apparatus for this purpose.

A Cold Air Duct.

Heating from Stove Coil.

From W. F. S., *Bayfield, Wis.*—The hot water heating plant which I placed in a barber shop according to instructions given in *The Metal Worker* December 1 is giving such satisfaction with the weather 10° and 15° below zero that it encourages me to ask some more questions on that system of heating. I am thinking of heating, or assisting my coal stove to heat, my dining room from a coil in the water front of my cooking stove or range, which is a No. 8. I am making my water front out of $\frac{3}{4}$ inch gas pipe and return bends. I cannot use larger pipe as it would take up too much space in the fire box. There will be four pieces of pipe 20

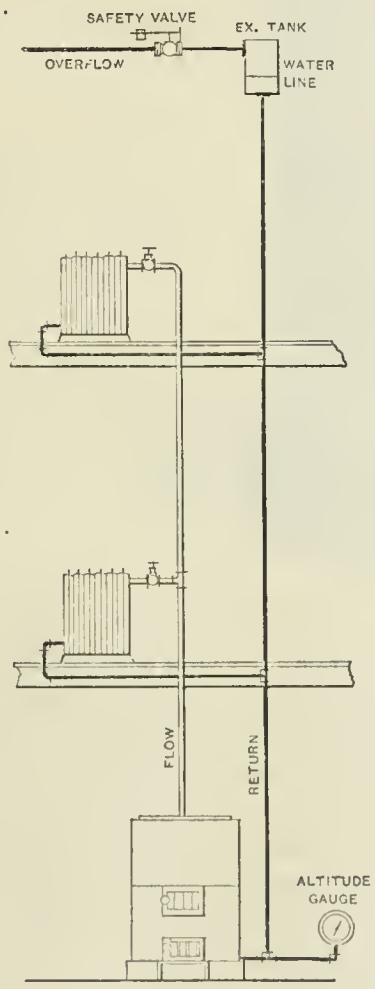
inches long exposed to the fire. I will connect the water front to a 30 gallon boiler and run flow pipe from top of the boiler to a coil of 1 inch pipe in the dining room. What I wish to know is, what size should I use for flow and return pipe from the boiler to the radiator; would it be practicable to use pipe larger than ¾-inch when my water front is only ¾-inch pipe? The distance from the boiler to the radiator is 10 feet, but three turns will have to be made in the return from the radiator, and it will have to run under the floor owing to a door. In making the return I will connect with the water back with a Y-fitting.

Answer.—The pipe coil which our correspondent intends to place in the stove will present a surface of about 2½ square feet. This character of surface will in all probability take care of 25 square feet of surface in the radiator for each foot of surface in the coil, or about 60 square feet in all. A ¾-inch pipe would give very fair service as a flow and return to a radiator of this size. There is no reason, however, why the flow and return pipe should not be larger, and as the radiating coil is to be 1-inch pipe, the flow mains may be made of the same size without disadvantage. The turns that will be made in the return pipe and the distance which it has to rise to connect with the water back, and the fact that the radiator is on the floor, will all hinder a lively circulation, but if the job is piped with a fall in the main from where it leaves the boiler to the radiator, and a fall in the return pipe all the way from the radiator to a point where it rises and connects with the pipe coil in the stove without air traps or low places, our correspondent may be successful in making the job work.

Purifying Cistern Water.

From M. A. X., *Cane Creek, Tenn.*—Please inform me, through the columns of *The Metal Worker*, what you know about a contrivance or invention by which cistern water can be cleansed without drawing the water off. A customer called to day and stated that such a thing was in existence.

Note.—We do not know to what device our correspondent refers, and if any of our readers know of such a thing we shall be glad to have them write us for this correspondent's benefit. It is not impossible that the scheme is to purify the water by carrying air down into it. This has been done on a large scale in water works reservoir with good results. The oxygen of the air destroys the impurities in a large measure and under certain conditions we presume this method could be followed for purifying cistern water.



How to Make Gold Plentiful.

From CORNICEMAN, *Chicago.*—I am much interested in the currency discussion now going on in the columns of our daily papers, but much of it seems to me to be devoid of common sense. I believe the whole question would be solved by a very simple enactment that on and after a certain date, a reasonable time hence, all debts exceeding say $25 should be payable one-half in gold at the option of the creditor. There would then be such a demand for gold that it would be, for a time at least, more profitable to import than to export it, and after gold again became abundant occasional exports would not excite a ripple of comment.

Pressure and Circulation.

From J. H, *Springfield, Mass.*—I submit two sketches of hot water heating plants about which I would like some information. If the hot water plant shown in Fig. 1 was filled with cold water to the dotted line in the expansion tank and the safety on the overflow set to open at 1 pound and the altitude gauge at the bottom of the boiler registered 21 pounds, what would the altitude gauge register if the lever on the safety valve was weighted so that no water would waste until 26 pounds pressure was developed at that point, and the plant was heated up and the safety valve wasting? Will a plant work piped as shown in Fig. 2 with the first radiator having both the flow and return connected to the flow main and the radiator above being connected with the flow main and its return connecting with the pipe to the expansion tank—will the first radiator get hot water? I have seen a plant piped in this way.

Answer.—In reply to the first query the pressure that will be shown on the altitude gauge will be the natural pressure due to the hight of the water col

Pressure and Circulation.—Fig. 1.—A Question of Pressure.

umn plus the 26 pounds pressure secured through weighting the safety valve, or a register of 47 pounds on the altitude gauge. In reference to the second query, the radiator that is placed highest on the system will undoubtedly secure a much better circulation than the lower radiator, and it is probable that if the return from the lower radiator was connected with the return from the

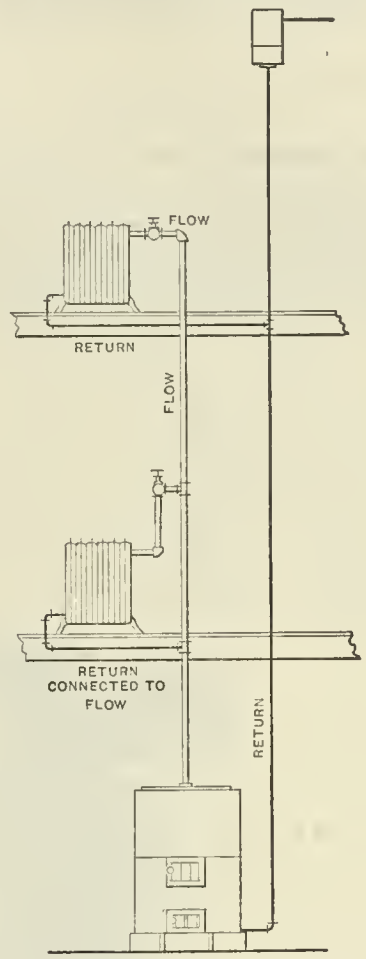


Fig. 2.—A Questionable Connection.

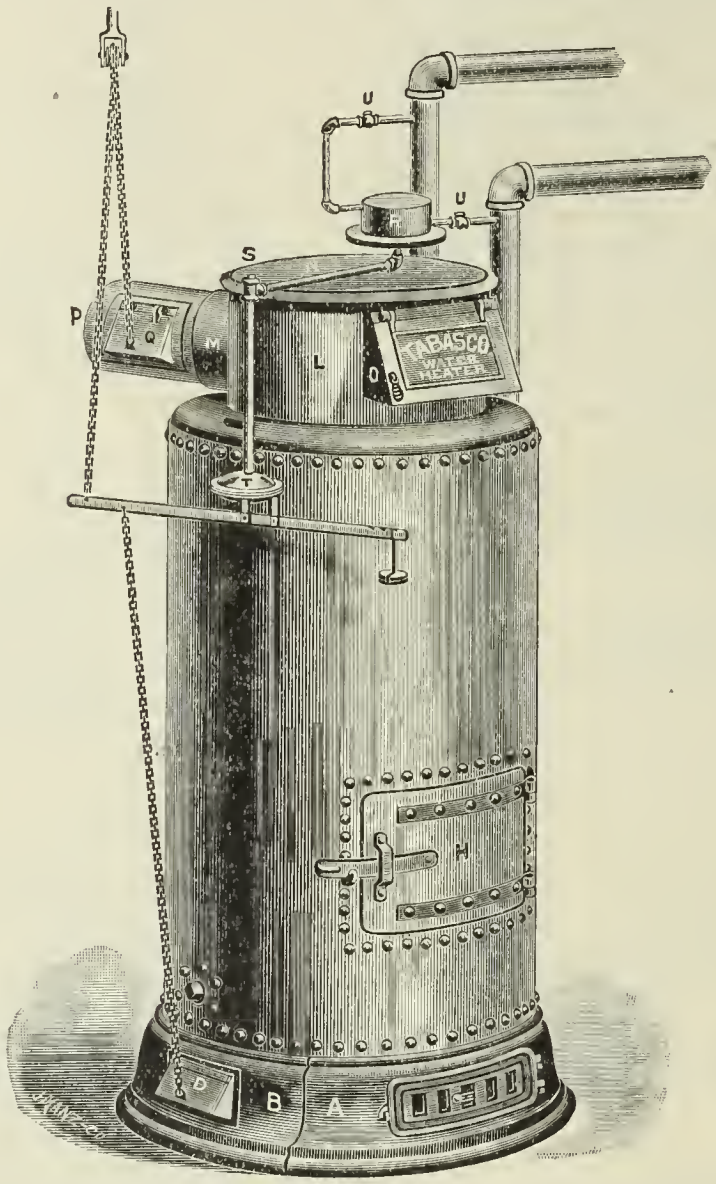
expansion tank better results would be secured. Further discussion on these inquiries is invited.

Insurance Rates on Gasoline Stoves.

From C. P. A., *Port Ewen, N. Y.*—I would like to ask the following question through the columns of *The Metal Worker*, as it may be of interest to some of my fellow workmen. Some time ago I purchased a gasoline soldering furnace for the shop and now my insurance agent says I must pay $2.50 extra if I burn it. I am already paying $18 75 per $1000 for one year and I think it is an outrage to ask for any more. If any of my fellow workmen have had any such experience I would like to know how they came out.

Question of Gas Pressure.

From G. E. S., *Pennsylvania.*—I am interested in a gas plant in this place. Our pipe line crosses a bridge, and at some periods of the winter we are annoyed by the reduction of the pressure during the cold weather. I think it is caused by hoar frost. The pipe is 6 inches in diameter. I would like to have an opinion from your readers who have had similar experience, and would ask them to give their views as to the best means of preventing the trouble.



Furnace Pipe Rule.

From H. T. G.—I would be very glad if some of the practical readers of *The Metal Worker* would tell me a rule for obtaining the size of pipe and register necessary to admit a certain quantity of air per hour into a room, the temperature of the air to be delivered being known.

STEAM AND HOT WATER.

The Tabasco Water Heater.

The accompanying illustrations show a general and sectional view of the Tabasco water heater manufactured by the Kewanee Boiler Company, Kewanee, Ill., with Chicago office at 96 Lake street. Fig. 1 is a general view of the boiler, showing its appearance and the automatic temperature regulator, while Fig. 2 is a sectional view illustrating the water spaces, the magazine feed, &c. This heater is especially adapted for heating water for bathrooms, laundries, hotels, flats, baptistries, &c., special claim being made for its simplicity, ease of management and safety. The heater is made of two plates, with one steel head and inside loose fuel magazine, which is easily dropped into place and removed when necessary. The grate can also be taken out without breaking the connections of the heater, and the whole apparatus, it is pointed out, can be put together as easily as a stove. The water ways, it is mentioned, are all vertical, there being no cross currents. All the fire surfaces likewise are vertical and directly over the fire. The boilers are all tested to 110 pounds water pressure before leaving the works. Special attention is directed by the manufacturers to the automatic temperature regulator shown attached in Fig. 1. The regulator pot R is a double shell, the intervening space being filled with water, and this water chamber is connected to the flow and return pipes at the most convenient points, so that the water from the heater flows through it. The inner shell is filled with air, and connected to the diaphragm T, the upper part of the diaphragm being filled with water at the plug S. The variation in the temperature of the water in the heater varies the volume of air, which, acting on the copper diaphragm, opens and closes the draft door D and the check draft Q. A proper adjustment of the weights on the diaphragm lever will, it is stated, regulate the temperature of water, within a very few degrees, and the rooms to be heated can be kept at any desired temperature without other attention than occasionally filling the magazine with coal.

The Tabasco Water Heater.—Fig. 1.—General View.

A. C. Edgar of the Model Heating Company, Philadelphia, and Percival H. Seward of the American Boiler Company, New York, were visitors at *The Metal Worker* office recently.

Heating and Drying by the Use of Exhaust Steam and Live Steam Reduced to Low Pressure, Either Separately or in Combination.*

BY ALFRED A. HUNTING, BOSTON, MASS.

Heating and Drying by the use of steam in a primitive way dates back to the time of its being first successfully used for power. Boulton showed by actual use that exhaust steam could be carried long distances in pipes and that a high temperature could be developed in drying rooms by its use.

Steam for heating has been a favorite study with many engineers, and such use has been highly developed in certain lines, especially in high pressure work, while less attention has been paid to the utilization of exhaust steam and heating at low pressure on a large scale. Heating by exhaust steam has been a bone of contention, many arguing that it was absolute waste to attempt it, that it was much more economical to allow the exhaust to go to waste, and that it was better to have a free exhaust and to do the heating by live steam. The plan of piping to use exhaust steam for heating and drying, as generally designed, causes a back pressure at the engine. This is especially true of the early work in this direction, where 10 to 15 pounds back pressure was used to force the

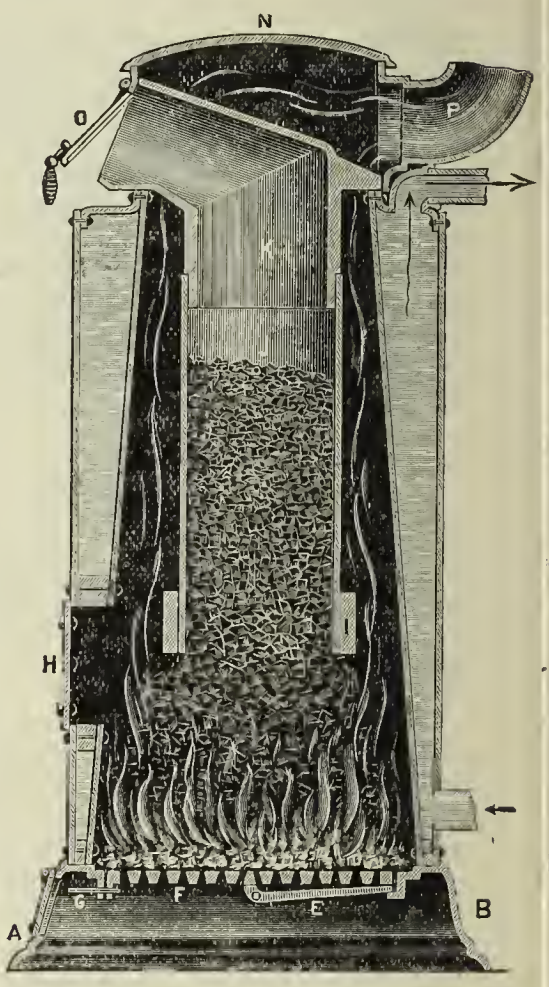


Fig. 2.—Sectional View of Heater.

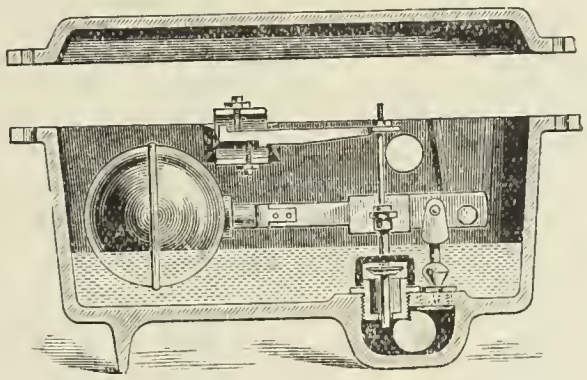
* Presented at the New York meeting of the American Society of Heating and Ventilating Engineers, January 22–25, 1895.

steam through a system. Even to day it is not unusual to find similar conditions. Lately plans have been put up to work with only 2 or 3 pounds of back pressure. It is wasteful to heat with exhaust or live steam above atmospheric pressure under ordinary circumstances, even where the plants are of the largest description. It needs no argument to prove that back pressure at an engine is a loss in the ratio of back pressure to mean effective pressure, especially when better results can be obtained by the use of exhaust steam, all back pressure being removed from the engine and the engine actually working under a vacuum, which can be shown by indicator cards and by gauges.



Steam heating plants vary in conditions, no two plants being just the same. There is no cast iron rule to be laid down by which they should be designed or by which they should be operated. Where engines and pumps are used, the steam which passes through them gives up a certain amount of heat units in power, still retaining, however, more of the said units than is generally sufficient for heating, drying, or for kindred purposes, even after passing through a feed water heater, and heating the water to a point near boiling. It has been satisfactorily shown in practice that steam at a pressure at or below the atmosphere heats the system more uniformly; that products of manufacturing processes are increased and at the same time; that a large saving in fuel and other economics is effected. Given a building of certain dimensions which is to be used for a purpose requiring steam for power, heat, and other purposes wherein the cost of steam for power is the same as the cost of steam for heating and other purposes, the two costing, say, $10 per day. Now, use the exhaust steam for heating and other purposes, and your bill for steam is cut in two, making it $5 per day. The saving will be greater or smaller according to the size of the plant and the amount of exhaust steam utilized. In cases where the uses to which exhaust steam can be applied are greater than the production, then live steam at a pressure corresponding to the exhaust steam, *i. e.*, atmospheric pressure, can be fed into the system to make up the deficiency, the two working in perfect combination and causing no back pressure.

In many cases where exhaust steam and live steam are fed into a heating system, usually run under pressure, the exhaust steam goes to waste, the live steam doing heating, by which practice the cost of heating is doubled instead of being lessened, as was the intention. There are many cases where small engines and pumps exhaust into one main exhaust pipe, the terminal pressure of no two of them being alike. Under these conditions (where a system is properly designed) the steam may be perfectly utilized for heating and drying without causing a back pressure on any one of the combination of exhausts. In a well devised system the water of condensation should all be returned to the boiler. There will, of course, be a small loss, but by the use of care the water bill may be reduced to a small item. In plants where the engines and pumps are stopped at night, the heating can be done by steam at reduced pressure from the boiler direct. This keeps the building perfectly heated, both by day and by night, which is a more economical practice than to allow it to cool off during the night to be heated again in the morning.

In the ordinary steam system run at moderate pressure, bubbles of air form on the interior of the pipes, radiators or dryers. After a time, if there are impurities in the water, the pipes and radiators are covered with scale, which covers the bubbles as well as the rest of the interior of the heating or drying surface until the whole interior is coated with a first-class insulating material, the heating surface losing in efficiency as such coating increases. Such an interior coating also retards the flow of condensed water. Water in pipes acts as a condenser and abstracts heat that should be given out through the heating surface. When it is attempted to remove air and water in the ordinary way (that is by pressure), a large per cent. of the heating surface remains inoperative, because such air and water are not properly or efficiently removed. Results count. The best system gives the best results. In a large office building in Boston, where it was supposed that everything had been done in a manner conducive to best economy in coal consumption and the general operation of the whole heating plant, a saving was made over the previous year, in four months' time, of over $1000. How was this done? Simply by the removal of air from the heating system, relieving the engines and pumps from all back pressure, and by discontinuing the use of live steam. The manner of piping and method of working in this case gives the results. It is equally effective whether exhaust or live steam at or below the atmosphere is used, or where steam at pressure is found to be necessary.

The Onderdonk Combination Steam Trap.

In the illustration presented herewith we show the Onderdonk combination steam trap manufactured by the Onderdonk Heating & Ventilating Company, 520 Commerce street, Philadelphia, Pa. This trap is designed to overcome flooding, and at the same time to prevent the escape of steam, both the inlet and outlet being large. The outlet is controlled by a valve, which is connected to a lever arm by an expansion spring. When only water is returned to the trap this outlet remains wide open and allows the water to discharge from the trap as fast as it enters. As soon as the steam enters the trap the springs are expanded and this outlet closes, and the condensation is then controlled by the float and is discharged through a much smaller aperture. The fact that the water is discharged through the larger port as soon as it becomes cooled prevents the possibility of the trap becoming frozen. The trap can be used to bleed high pressure mains, and it is not necessary to provide a by-pass around it, the expanding port serving the purpose. In operation it is claimed that the trap will return a very large amount of condensation, and will also serve as an air vent for a heating system. The trap is made in five sizes to control from 1400 to 12,000 square feet of pipe or heating surface.

The Onderdonk Combination Steam Trap.—Sectional View.

The Literature of Heating and Ventilating.

At the New York meeting of the American Society of Heating and Ventilating Engineers, held January 22 to 25, an interesting paper on the literature of heating and ventilation was presented by Hugh J. Barron of New York, from which we quote as follows:

I think it advisable at this place to insert a list of all the literature on this subject that I have been able to secure the use of. I have divided this list into three parts, the first consisting of books, the second part of essays, and the third of catalogues. I have excluded everything that does not pertain to the arts of heating and ventilating as a special field of effort, and I have been particular to avoid the scientific aspects of the subject of heat and of steam engineering. I have, as far as possible, given the dates when the works were published. There will, of course, be some errors, due to different editions of the same work and other causes. These lists, I am satisfied, do not contain half the works that have been published; many are lost; more are inaccessible.

In the development of the arts no work of man is to be despised; even the most rubbishy is interesting as a milestone on the march of human progress. Philosophers now generally realize that the histories of nations are in their arts and their literatures. The true history of this special art is in its literature, and when that is carefully examined it will be found that its development has been due to the thousands of unknown workers that have been engaged in it, and that any one man's share in the advancement has been very small indeed.

Heating and Ventilation of School Buildings.*

BY T. J. WATERS, CHICAGO, ILL.

The subject of heating and ventilation of school buildings is one which has been ably discussed from various standpoints by eminent heating and ventilating engineers for a number of years, and in view of this fact it is with a great deal of diffidence that I make the effort to address myself to the subject. It may safely be stated without fear of contradiction that a system of steam heating and mechanical ventilation, properly arranged and proportioned, is the one recognized as being superior to all others by the most advanced heating and ventilating engineers of the present time. A brief history, therefore, of the introduction of the first steam heating and mechanical ventilating apparatus in a Chicago public school may not be out of place, but rather of interest to the members of the American Society of Heating and Ventilating Engineers.

The building referred to is the Dore school, located on Harrison street, near Halsted street. The structure is brick, four stories high, and contains 16 class rooms, one office and two recitation rooms. It was erected in 1867, but the system of heating and ventilation was not finally determined upon until the building was nearly completed. The original intention was to heat by furnaces, but owing to the indefatigable efforts of W. J. Twohig, now with the Crane Company, but at that time of the firm of Walworth, Twohig & Furse, then leading steam heating contractors in the West, the Board of Education decided to take a step in advance of the times, and accepted the proposition of said firm, which provided for a system of indirect steam heating and mechanical ventilating apparatus, designed and installed under the direction and supervision of John Woodman, their superintendent. The apparatus consisted of two horizontal tubular boilers 42 inches by 12 feet; with 34 3 inch tubes each; four return bend coils of 1-inch pipe, each 22 feet long, 14 pipes high by 12 pipes wide. These coils were located in the basement corridor and inclosed in brick work. Each coil was connected with four rooms by means of two tin ducts which extended up in wardrobes and terminated in each room 12 inches above the floor, about 20 feet apart, with a deflecting hood arranged so that the current of air was directed downward. These hoods were also used to control the volume of air, as no switch damper was provided to regulate the temperature thereof. The corridors were also heated from these coils, there being four registers on the first floor. There were four 18-inch steam traps, "pot" pattern, one for each coil, which discharged the water of conden sation into a receiving tank, and from thence it was pumped into the boilers. The blower, 72 inches in diameter, was inclosed in a brick housing and was operated by a 9 x 14 inch engine. The blower was manufactured by Morris & Tasker Company of Philadelphia, and is still in use. For a period of seven years the heating apparatus gave fairly good results, when it was found necessary to remove the old coils, owing to the great number of leaks occasioned by rust in the form of pin holes. The coils would have lasted much longer, no doubt, had they been placed in a perfectly dry basement or kept in constant use.

The present apparatus in this building was designed by the writer, and consists of wrought iron staggered pipe radiators, one being placed at the base of each duct. In addition to these radiators, wall coils were placed in class rooms around the exposed walls under windows. The old boilers proved to be inadequate, and a few years after the coils were removed new boilers were substituted. A number of school buildings were heated in the manner just described three years prior to the removal of the old apparatus, and, in fact, all the school buildings heated by steam up to 1889 were heated practically in the same way. Since the installation of the first apparatus various improvements have been made, principally in the manner of introducing air, and also in the placing of switch dampers in blast ducts, thus enabling the teacher to regulate the temperature of the air without decreasing its volume. We have several buildings in which disk fans are used, one being a blast fan to distribute air through galvanized iron ducts suspended from the ceiling to the various indirect cast iron radiators, and from thence to class rooms by means of vertical ducts. The exit ducts from class rooms in these buildings are usually concentrated in a room in the basement, where an exhaust fan is placed to draw the air from the various rooms and expel it from the building. About three years ago the writer discontinued the use of the latter fan for all new work. After a series of careful experiments and observations in old buildings formerly heated by furnaces and subsequently equipped with steam heating and mechanical ventilating apparatus, blowers being used, it was found that satisfactory ventilation was obtained by the use of the old exit ducts which led from each class room directly through the roof. There can be no doubt but what a more positive movement of air may be obtained by the employment of an exhaust fan, but the objection to its use, however, aside from the additional cost lies in the fact that it has a tendency to create a partial vacuum in a room, thus allowing the cold air to rush in through openings around the windows. The warm air entering the room through the blast duct is also liable to be drawn too rapidly to the point of exit, thus subjecting the occupants to disagreeable drafts.

The question of drafts has been a source of annoyance to the writer for a number of years, more especially in buildings where mechanical ventilation is employed. Five years ago I determined to experiment on a new line in an old building which was being remodeled. The building is brick, three stories high, and contains 12 class rooms, an office and two recitation rooms. It was formerly heated by wall coils and a system of direct-indirect staggered pipe radiators, two radiators in each room, valved so that either one or both might be used. The radiators referred to were 4 pipes wide by 28 long by 34 inches high. It occurred to the writer that by placing one-third of the total amount of surface, eight radiators, between the outside air and the inlet to the blower, 72 x 42 inches, the air, after passing through these radiators, would be about 70°, consequently it may be readily seen that a change from the maximum, about 120°, to the standard minimum of 70° would be a decided improvement on the old method of using the air for tempering purposes at the temperature of the outside atmosphere. The balance of the radiators, 16, were placed on a suitable platform of wood in front of the blower outlet, arranged in three sections, 2 radiators wide by 2 high, and each section controlled by valves, so that any one or all might be used, as occasion required. The wall coils were allowed to remain, but are not used except in extremely cold weather, and then only in the morning until the building is properly heated. The blower is operated by an 8 x 12 inch horizontal slide valve engine. The exhaust steam is utilized in the heating apparatus, and cross connected in such a manner that it may be turned into radiators in the cold air chamber and also in the warm air distributing chamber, or to the 3-inch wrought iron vapor pipe from a cast iron catch basin, which extends up through the brick smoke stack to a point 3 feet above it. A pressure regulator is used on the heating main, and a pressure of from 1 to 5 pounds per square inch on the system is sufficient in the coldest weather to maintain a circulation in the radiators. The water of condensation is returned to a sealed tank made to withstand a pressure of 100 pounds per square inch. A water regulator is attached to the tank and connected with the city main to maintain a uniform water line. A duplex steam pump, 5¼ x 3½ x 5 inches, is used to force the water of condensation from the tank into the boilers. The steam heating apparatus proper is known to the trade as Waters' semi-gravity system, and was introduced to supplant steam traps seven years ago.

Since the introduction of the above system a saving of from 15 to 20 per cent. in fuel has been accomplished in some buildings from which the steam traps were removed.

The platforms in the cold air chamber, and also in the warm air distributing chamber, stand about 3 feet 6 inches above the basement floor, the space beneath the platform being used as a chamber for the tempered air. The entire chamber is inclosed in brick work, and a galvanized iron duct, 18 x 20 inches, leads therefrom on the basement ceiling, which connects with a vertical duct to each class room. These ducts have openings near the ceiling inside of the warm air chamber, in which a switch damper is located to regulate the temperature of the air passing through them. The ends of the ducts terminate at the bottom of the platform, full size, to receive the air at the minimum temperature. The dampers are operated automatically by the Johnson electric system of heat regulation. A damper is also placed in each duct to regulate the volume of air. It will thus be seen that when one of the switch dampers is closed against the air at the maximum temperature its volume through the duct is not diminished, and also the amount thus shut off from the top of the platform is exerted on all ducts open to its influence. The results obtained from this arrangement were so satisfactory that all new school buildings erected in the city of Chicago since 1889 have been provided with a heating and ventilating apparatus of this character. It is true that several minor changes have been made from time to time with a view to reach a higher

* Presented at the New York meeting of the American Society of Heating and Ventilating Engineers, January 22-25, 1895.

standard of perfection, but the essential features, as above described, still prevail. The style of radiator adopted for this work is 1-inch staggered pipe 4 pipes wide, 32 pipes long, by 6 feet high.

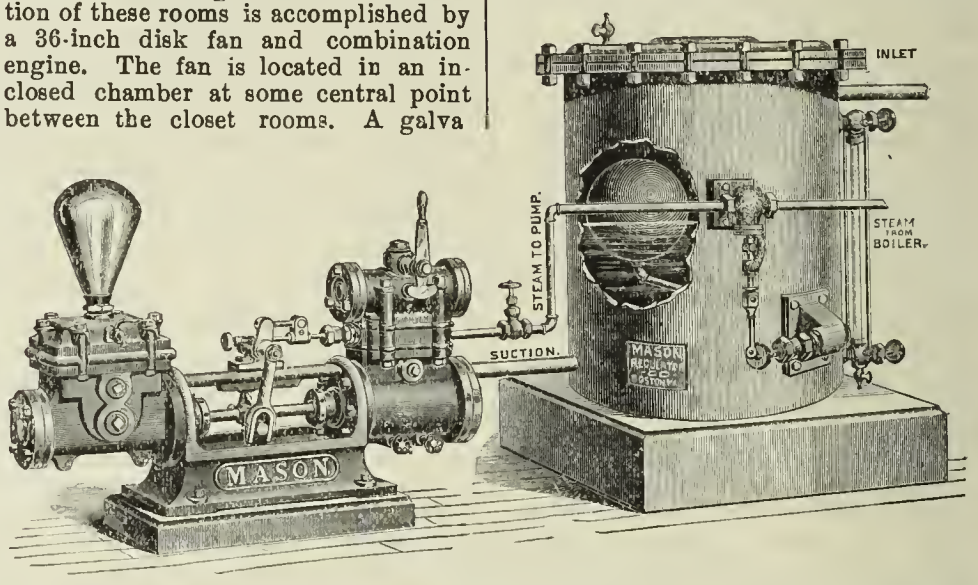
In designing an apparatus of this kind, care should be exercised in the location of blast and exit ducts. My practice for several years has been to introduce the incoming air toward the ceiling at a point about 7 feet from the floor line and to locate the exit ducts, whenever practicable, on the same side of the room as the former ducts. The size of each of these ducts will average 18 x 20 inches, or a cross sectional area of 2.5 square feet.

It is obvious that an amount of air sufficient to properly ventilate an ordinary class room, 25 x 32 x 14 feet, containing 60 pupils, must pass through a duct of the size given above at a velocity of 12 feet per second, or 720 fect per minute to furnish the required amount *per capita*.

Notwithstanding the fact that the minimum temperature of the air has been raised to a standard of 70°, drafts are in some instances perceptible to a disagreeable extent if the switch damper is closed against the air of maximum temperature when it is introduced at such a high velocity. Various devices have been introduced by the writer in the shape of deflectors, placed in front of the outlet of blast ducts in rooms to break up the current of air, but nothing approaching satisfactory results was obtained until quite recently. The latest device consists of a galvanized iron hood placed in front of the blast duct, which extends on both sides of the same, and presents a cross sectional area of 6 square feet. The current of air entering this hood is broken up placing two diaphragms, one on each side of the center of the duct, with a slight curve to each end of the hood. An open space of 6 inches is also left between the diaphragms, thus dividing the inflow of air into three equal parts and compelling it to pass in as many different directions from the hood, at an angle of 45° toward the ceiling. This device has been in operation since September 1 of the past year, and thus far I have not heard a complaint about drafts. The above arrangement reduces the velocity of the air through the same size duct at its terminus about 58 per cent., which fact is worthy of consideration by any person interested in this class of work. It is quite natural to suppose that a galvanized iron hood of such dimensions would look unsightly, but if properly made and painted a color to harmonize with the wall, it certainly ought not to be considered objectionable by the most fastidious. It has been found from actual experience and observations that 30 cubic feet of air per minute, or 1800 cubic feet per hour, *per capita*, is necessary in order to secure satisfactory results. The above fact was clearly demonstrated a few years ago in a class room which had a seating capacity of 60 pupils. Owing to the crowded condition of the building, however, 10 additional pupils were placed in this room. After school was in session about one hour it was found necessary to open some of the windows owing to the vitiated condition of the air. A short time after an additional room was fitted up to relieve the overcrowded one, and as soon as the extra pupils were removed there was no further difficulty experienced.

For some years past the tendency has been to decrease the number of sittings from 60 to 54. It is good practice, however, to provide a blower which will readily furnish the maximum amount of air required without forcing it to its full capacity, especially if it is placed within the building and under a class room. Engines or blowers operated at high velocities will transmit vibrations to walls and floor joists, which are objectionable. If brick walls are used around blowers, care should be taken not to have them touch the ceiling for the reason just stated. A space of 4 inches may be left between the ceiling and wall which can be filled in by means of a rubber belt or mineral wool, which will reduce the effect of vibrations to the minimum.

The boys' and girls' closet rooms erected during the past six years are isolated from the main buildings, but are reached by connecting passages from the basement rooms. Said closet rooms are heated by ceiling coils only, no indirect heat being used. The ventilation of these rooms is accomplished by a 36-inch disk fan and combination engine. The fan is located in an inclosed chamber at some central point between the closet rooms. A galvanized iron duct of suitable size is extended from a point near floor line in each room to a fan chamber, and from thence the air is expelled outside of building. Until three years ago it was the practice to heat the said rooms by direct and indirect radiation, but the latter was abandoned because it was found impossible to keep the doors closed leading to the basement rooms. As a result the slight pressure occasioned by the blast from the indirect chamber caused an outflow of air from the closet rooms when the doors were opened, which invariably found its way to the corridors and ultimately to the class rooms. If closet room doors remain open now, the air moves in the right direction, or just the reverse of its former course whenever the fan is in operation.



During the present year I decided not to specify wall coils for class rooms of new buildings. The only direct heat now being used is in the shape of radiators located in the first and second story corridors. Doors are provided in the cold air chambers, so that air may be taken directly from the building in the morning up to about one-half hour before sessions begin. The exit ducts from the rooms are brought together in the attic and connected to a circular duct which extends through roof, properly capped. In some of the large buildings there are two ducts, as described. A damper is placed in the said ducts in such a manner that they may be operated by the engineer by means of a cable which extends to the basement. These dampers are kept closed in the morning, thus avoiding the introduction of cold air through exit ducts. When air is introduced from outside of the building the dampers in the exit ducts are then opened. A building can be heated in this manner at least one hour earlier than it is possible to heat it by taking air directly from outside, which means a considerable saving in coal.

We have about 300 school buildings, including rented buildings to relieve overcrowded districts, in which are used nearly every conceivable style of heating and ventilating apparatus. There are 150 buildings heated by steam, and 75 of these are equipped with a heating and ventilating apparatus similar to that introduced five years ago and which has been fully described above.

It may be of interest to know the cost of a steam heating and mechanical ventilating apparatus since new methods have been adopted, as compared with the old style of five years ago, for a building containing 17 class rooms, 1 office and 2 recitation rooms.

	1889.	1894.
Steam heating.....	$7,595	$3,883
Mechanical ventilating.....	6,106	3,400

Which shows a saving in cost for both apparatus of about 46 per cent. in favor of the present system.

The Mason Receiver.

The Mason Receiver.

The Mason Regulator Company of Boston, Mass., have put on the market in connection with their steam pump a receiver for draining the condensation from radiators, drying cylinders, steam coils and, in fact, any system of steam heating. This receiver takes these returns and automatically delivers them to the Mason boiler feed pump. It will be noticed by referring to the cut that the condensation enters the receiver at the point marked "inlet" and fills the vessel until it carries the ball float up to a certain level, when the float in rising opens the balanced valve which is shown on the outside of the receiver and which admits the steam to the pump. The pump immediately starts and draws the accumulated condensation through the suction pipe, forcing it back into the boiler. The greater the quantity of water in the receiver, the faster will the pump move, and as the water level diminishes in the receiver the pump slows down. Instead of the ordinary copper float, an electro deposited float is used. Although the pump is single acting, it is impossible for it to stop on the center.

After the Convention.

THE presidential address of E. P. Bates at the opening of the Convention of the American Society of Heating and Ventilating Engineers can be read frequently by members and those desiring to become members with advantage, if its suggestions are followed. It is lofty in sentiment and the society will operate on a high plane if it is kept in mind by the members.

***

IN reading our report we find that the word "fsn" has been substituted for "coil" in the remarks made by Stewart A. Jellett on the use of heating coils behind the fan so that the fan drew its air supply through the coils.

***

THE opinions of the convention that have been expressed since its adjournment are unanimous in agreement that the society has made an excellent start and has been of value to all who were fortunate enough to be able to arrange their business to be present.

***

SOME of the less technical members hope to have their practice explained from a theoretical standpoint, so that practice and theory may not herd by themselves in the society.

***

THE society can do a great good to the public by treating furnace heating scientifically and in detail, so that its evils may be eradicated, as furnace heating is established to stay and is popular with an immense proportion of the public. Anything that is so generally used is worthy of attention.

***

IN the comparison of methods followed in heating the high buildings now common, some of the members did not agree, and in the discussion that ensued much food for reflection was furnished.

HEATING NOTES.

PRESIDENT JOSEPH BOND of the American Radiator Company, Chicago, sails for Europe on the 15th of February to arrange for the company's London office, of which Henry S. Downe will be manager. The present address of the company in London is care of the Union Bank.

IT IS STATED that the radiator factory at Elwood, Ind., has passed into the hands of a company of local capitalists with a paid up capital stock of $50,000, to be increased shortly to double that sum. The officers of the new company are: President, T. L. DeHority; secretary and treasurer, F. M. Headley; directors, A. J. Hobbs, J. B. Hobbs, F. M. Headley, T. L DeHority and John Halloran.

IN NEW OFFICES at 141 Centre street, New York, Thomas W. Weathered's Sons have a welcome for the hot water heating tradesman or those interested in greenhouse construction. On entering the outer office the drafting room is at one side and the general office at the other. From the general office entrance is gained to the private office and the wareroom. These offices are heated by steam, which presents the exhibition of their hot water boiler on the office floor heating radiators at desirable points, which was the method of heating employed in their former offices.

THE FOSTER ENGINEERING COMPANY, Newark, N. J., have just entered an order for two valves, 18-inch and 14-inch in size, intended for the Anheuser-Busch Brewing Association of St. Louis. These pressure regulators are of the Foster New "Class W" style, and when completed will be the largest reducing valves ever turned out of their works.

ROHN & ELLICOTT, Easton, Pa., are distributing circulars directing attention to the Easton boiler for steam or hot water. The fire box of this boiler is a hollow cast iron water reservoir, and the boiler proper is made of horizontal tubes presenting a very extensive surface to the heat. The circular gives table of prices and sizes and prints a number of references and testimonials.

PRESIDENT W. K. PIERCE of the American Boiler Company. Chicago, was a visitor at the New York house this week. The company have a varied line of steam and hot water heaters which they keep before the trade with satisfactory results.

GEORGE B. COBB & Co., 96 Centre street, New York, are enlarging their office and showrooms to facilitate the transsction of their business in steam and hot water heating. They are also showing some novelties in the gas heating line.

THE HEATING AND VENTILATING APPARATUS at the Ira Allen School House, at Burlington, Vt., was tested by E. O. Burrows, heating engineer of the Smith & Anthony Company, Boston, Mass., manufacturers of the heating apparatus, and George H. Holden of the G. S. Blodgett Company, who installed the plant, before the following School Committee: H. O. Wheeler, Charles E. Allen, Dr. D. C. Hawley, C. C. Miller, James Childs and others. The first test was made on the second floor. The supply of fresh air of inlet was 2257 cubic feet per minute. This gives for the 39 seats in the room 57 cubic feet of pure air per seat per minute. The quantity of air exhausted wss 2604 cubic feet per minute, which gives for esch of the 39 seats 66 cubic feet per minute. The carbonic test in this room showed four and sixtenth parts of gas in each 10,000. (As the outside air is considered pure at four this will be observed as a very gratifying result.) The difference in temperature at four different points in the room on the ssme level was only 2° F.

Electric Fans for Heating Purposes.

R. J. Feather of the Edison Electric Illuminating Company of Piqua, Ohio, writes to the *Electrical Engineer* as follows concerning a new and ingenious use for the fan motor: "I would like to state a use for the ordinary fan motor which is generally used for cooling a room. It may, I find, be employed to great advantage in a cold snap by placing one of them before the steam radiators in universal service and thus forcing the air between the coils of the radiator. Evidently this arrangement will greatly increase the heat yielding capacity of the radiator by diffusing the heat more rapidly and steadily, and instead of the heat being greatest close to the radiator, a circulation of air is set up which spreads the heat to every part of the room equally. This idea may help other readers of your journal to maintain the temperature of their rooms sufficiently high and even if they have fan motors."

Iowa Steam Fitters.

The Iowa Steam Fitters met at the Citizens' Association Rooms, Burlington, Iowa, lsst week, and perfected a State organization. Following were the members present:

Henry Dunker, Davenport; N. O. Holman, Mason City; John Burnside, Des Moines; John E. Allen, Des Moines; H. P. Keyhoe, Ottumwa; P. R. Sutton and Frank Volles, Keokuk; A. R. Barnacle, Boone; Chas. G. Bosch, Burlington; Wallace & McNamara, Des Moines; Des Moines Plumbing Company; W. H. Young & Son, Fairfield; George Kendall & Co., Clinton; John Coles, Des Moines; Henry Ewinger, Burlington, and the Davenport local. After transacting the routine business the following officers were elected:

John Collis, president.
Robert Clayton, vice president.
C. W. Rosene, secretary.
P. M. McNamara, treasurer.

The meeting then adjourned, subject to the call of the Executive Committee.

THE J. H. MCLAIN COMPANY, manufacturers of hot water and steam heaters and warm air furnaces, have removed their Chicago branch to 58 Dearborn street. In their new location they will have very pleasant quarters, with ample room for the display of samples as well as plenty of space for offices. They will be on the ground floor, so as to be easy of access, and are within the locality now distinctively recognized as the center of the steam, hot water and furnsce fraternity. The company do no contracting, but operate an entirely independent business, selling to the general trade. C. B. Matteson is the efficient manager in charge.

Good Advice.

The following excellent suggestion is sent us by a correspondent who signs himself "A. L. B." The moral of the story is so plain that no introduction is needed to emphasize it:

Bob-it-ty-bob go the runners
That carry tne hotel 'bus
With a load of guileless drummers
Who have put in the day with us.

We were not ready to buy,
But they were ready to sell,
And I sometimes wish when a drummer I see
That they were all in—well.

I don't mean the jolly drummers,
But the people who scnd them out,
For I certainly think
That printer's ink
Would bring the same tradc about.

A test last week of the chains made at the Charlestown Navy Yard, Boston, showed remarkable results. Five sections of 2¼ inch chain, 46 pounds to the link, were strained up to 380,000 pounds, when the officials desisted for fear of breaking the testing machine. The test was much in excess of Government requirements.

ROOFING AND CORNICE.

Conductor Heads.—II.

BY CORNICE WORKER.

Patterns for a Square Molded Leader Head.

In Figs. 16, 17 and 18 are shown the plans, elevations and patterns required for a square molded leader head, the leader to be square in plan and to stand away from the wall as indicated by A in the plan views. Let B C D E in Fig. 16 represent the plan of the leader head, corresponding to J K L M of the elevation, and F G H I the plan of the square pipe, corresponding to O of the corresponding numbers dropped from the profiles J L and K M at right angles to J K. Lines traced through these intersections, as shown by N P and O R, will be the desired pattern for the front of head. In Fig. 17 is shown the plan, elevation and pattern for the side of the leader head. C B D E represents the plan of the head, corresponding to J K L M of the elevation, and G F H I shows the plan of the square leader, corresponding to O of the elevation. As before explained the leader stands away from the wall, as is indicated by A in plan and side elevation, Fig. 17. It will be noticed that the profiles are profiles J L and M K. Lines traced through these points of intersection, as shown by N P and O R, will be the required pattern for the sides of the leader head, of which two would be needed, one formed right and the other formed left. The lines numbered 1′, 2′, 3′, 4′, 5′ and 6′ shown outside of the pattern in Fig. 17 correspond to the same numbers shown in the profile of the side elevation facing the wall line. Laps are allowed on the pattern of the side pieces, thus avoiding them on the front and rear pieces. In Fig. 18 is shown the plan, elevation and pattern for the rear of the leader

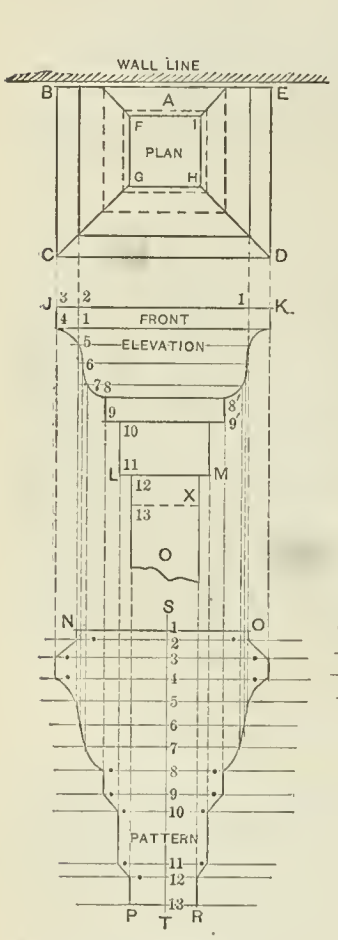


Fig. 16.—Plan, Elevation and Pattern for Front of Leader Head.

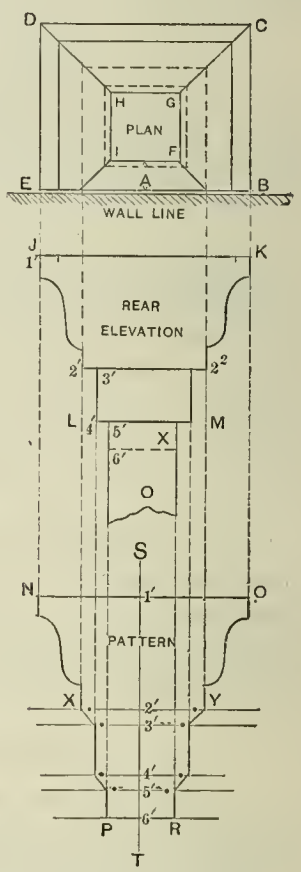

Fig. 18.—Plan, Elevation and Pattern for Rear of Leader Head.

CONDUCTOR HEADS.—DIAGRAMS ILLUSTRATING PATTERNS AND METHOD OF BENDING.

elevation. The dotted lines drawn from the elevation to the plan show their relationship to each other. The dotted line 13 X, drawn across the leader O of the elevation, indicates the flange which will be added to the pattern, the length of which is shown from 12 to 13 in elevation. For the pattern of the front proceed as follows: Divide the curved portions of the profile J L of the front elevation, Fig. 16, into an equal number of parts, as shown by the small figures. At right angles to L M of the front elevation draw the line S T, upon which place the stretchout of the profile J L, as shown by the small figures on the line S T. At right angles to S T and through the small figures draw lines indefinitely as shown, which intersect with lines of alike in the three elevations shown in Figs. 16, 17 and 18, and that part of the same profile is shown on the side elevation, as indicated by 2′, 3′, 4′ and 5′ in Fig. 17, which fills out the projection from the wall. For the pattern of the side proceed as follows: Divide the curved portions of the profile J L into an equal number of parts, as shown by the small figures. At right angles to J K of the side elevation draw the line S T, upon which place the stretchout of the profiles J L in the side elevation, as shown by the small figures on the line S F. At right angles to S T and through the small figures draw lines indefinitely, as shown, which intersect with lines of corresponding numbers drawn at right angles to J K of the side elevation, from the small figures in the head. D E B C indicates the plan, corresponding to J L M K of the elevation, and H I F G shows the plan view of leader, corresponding to O of the elevation. With the usual projection A, it will be noticed that J 2′ 2² K, of the rear elevation in Fig. 18 is simply a flat piece of the same shape as shown in front elevation in Fig. 16 by J 9 9′ K, the side view of which is shown by 1′ 2′ in the side elevation of Fig. 17. The dotted lines drawn from the side elevation to the rear elevation show the relationship of parts indicated by similar numbers. Number the bends shown in the rear elevation, 1′, 2′, 3′, 4′, 5′ and 6′, corresponding to the figures shown from K to M of the side elevation, Fig. 17.

For the pattern of the rear of head

proceed as follows: At right angles to J K of the rear elevation, Fig. 18, draw the line S T, upon which place the stretchout of the profile K M of the side elevation, Fig. 17, as shown by the small figures on the line S T in Fig. 18. At right angles to S T and through the small figures draw lines indefinitely, as shown, which intersect with lines of corresponding numbers drawn from the numbered heads at right angles to J K of the rear elevation. A line traced through these intersections, as shown by X P R Y, will be part of the rear pattern. For the remainder proceed as follows: The remaining portion above is a duplicate of J 2′ 2^2 K of the rear elevation. In Fig. 19 is shown the finished view of the leader head, as seen from the rear. The bends marked 1′, 2′ 3′ and 4′ 5′, Fig. 19, indicate bends of similar numbers shown in the rear elevation. At A of Fig. 19 are shown some of the laps indicated on the pattern of the side shown in Fig. 17.

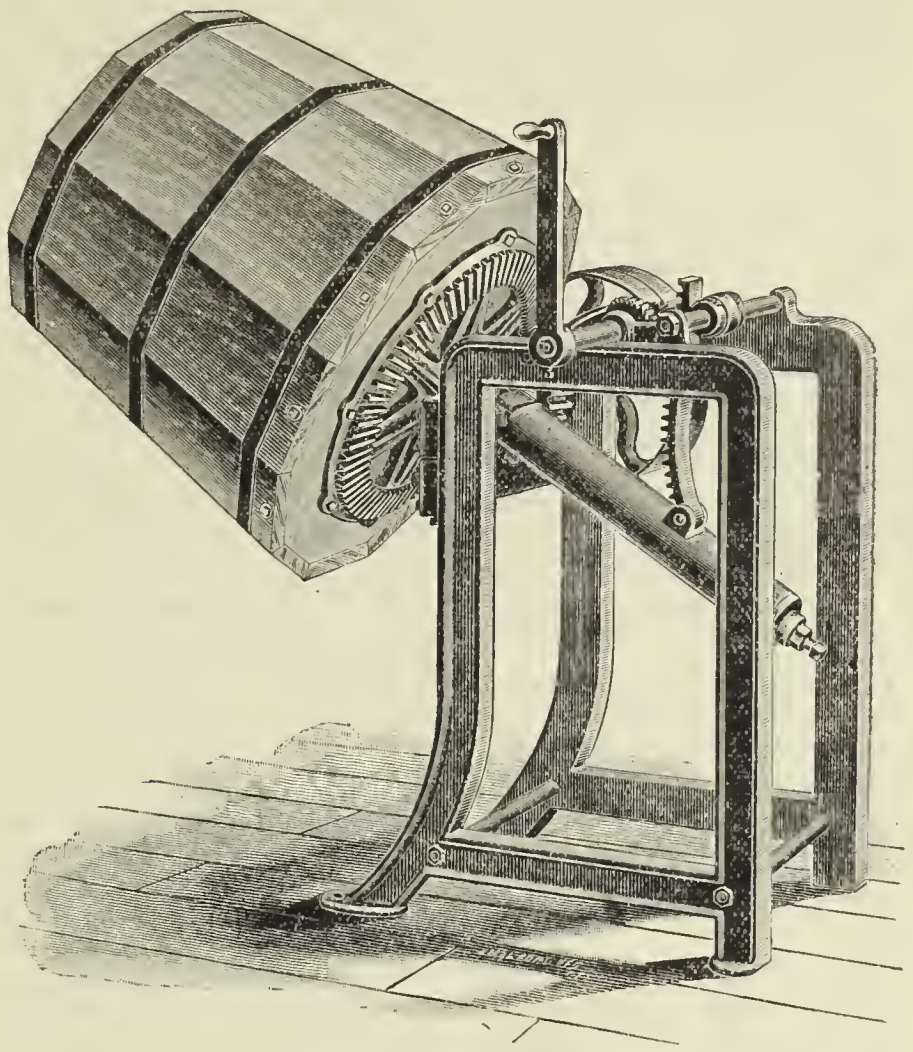
Forming or Bending the Head.

Fig. 20 represents an end view of the former and indicates the method of forming the ogee moldings. Select the proper size pipe or former and place it in its cross groove. Let J L in Fig. 16 represent the molded head to be formed The bends 2, 3 and 4 in the profile J L are bent upon the hatchet stake as explained in the previous article and then placed upon the former H in Fig. 20 in the position shown by X A. Hold X firmly against the former and press down A, and it will look as shown by X B. Now place X B upon the former H^1 in its proper position as shown by X^1 A^1. Hold X^1 firmly against the former and press down A^1 and it will look as shown by X^1 B^1, which completes the ogee. The square bends shown by 8, 9, 10, 11 and 12 in the profile J L, Fig. 16, are made upon the hatchet stake.

FLASHINGS.

Auld & Conger have recently made some improvements at their slate quarries, among which may be mentioned the extending by 170 feet of their storehouses at Raceville, N. Y. This makes the entire storage shed about 400 x 40 feet and gives a capacity of about 10,000 squares. This shed is at the railroad terminal of their tramway and connects with their Mammoth Vein Green Quarry. The quarries of the concern are located about 3¾ miles from the village of Poultney, and prior to the building of their tramway all slate had to be hauled that distance by team, which was unsatisfactory for a number of reasons, prominent among which were the frequent and serious delays in shipping. The result was a cable tramway 1¾ miles in length, which has a capacity of eight cars per day. This tramway is an endless rope, supported on trestles about 300 feet apart and from 15 to 55 feet high, depending upon the surface of the ground over which it passes. On this rope are wrought iron baskets of sufficient size to carry about one third of a square of slate. The baskets are suspended by an arm or bail, with a saddle resting on the rope in such a way that the baskets remain stationary, while the rope is kept in motion by an engine at the quarry end of the line. The firm are large producers of roofing slate, and have quarries and offices at Poultney, Vt., and Bangor, Pa. Their principal office, however, is located at 100 Euclid avenue, Cleveland, Ohio.

C. B. Rickert, 149 Clark street, Chicago, has the contract for the skylights and sheet metal work on the Fort Dearborn Building, Clark and Monroe streets.



Wagner Bros., 1350 Diversey street, Chicago, have the contract for the galvanized iron cornice, skylights and slate roofing for the soda water factory of M. Hoffmann, Noble and Blucher streets.

James J. White, 185 Dearborn street, Chicago, is to furnish about 200 squares of corrugated iron sidings, gutters and conductors for the Gates Iron Works, Elston avenue and Bloomingdale road.

Kurtz & Co., 2427-29 Calumet avenue, Chicago, are furnishing the copper cornices for the residence of T. Leonard, Grand boulevard and Forty-eighth street.

Williams & Manogue of Grand street, Troy, N. Y., have their full force of men now on the State armories jobs, both at Niagara Falls and at Glens Falls, N. Y. They are doing the slate and metal work on both armories.

The Clason Company of No. 3 Charles street, Providence, R. I., have just received the contract from Messrs. Norcross Brothers for the slate and copper work on the Francis S. Kinney new mansion at Narragansett Pier, R. I.

The Baird Tilting Tumbling Barrel.

J. J. Colvin, 159 La Salle street, Chicago, is doing the galvanized iron, tin and copper work on the two residences of J. L. Cochran, Edgewater.

Fred. Hartmann, 143 Wells street, is furnishing a large amount of galvanized iron work to be used in connection with refrigerating machines.

G. Drouve, Bridgeport, Conn., has several thousand dollars' worth of copper in his shop on Clinton street, part of which is being made up into skylights for the roof of the big new building of the Farrel Foundry & Machine Company in Ansonia.

C. B. Rickert, 194 Clark street, Chicago, is to furnish the copper work and tile roofing for the residence of Mrs. Emmons Blaine, Rush and Erie streets.

The Knisely & Yeldham Company, 68-74 West Monroe street, Chicago, have the contract for copper work and Spanish tile roofing on the residence of William Metzger, Washington boulevard and Sacramento avenue. The copper to be used is 18-ounce both cold rolled and soft. Some five tons will be required. They have also just finished a large copper cornice for Contractor Bishop on the new Boston store.

The Baird Tilting Tumbling Barrel.

The tilting tumbling barrel made by the Baird Machine Company of Oakville, Conn., is formed with a spindle projecting from the bottom, as shown in the illustration. This spindle enters a sleeve pivoted to swing at its upper end and having a segmental rack attached near its lower end. This rack engages with a pinion mounted on a crank shaft, by means of which the barrel may be given any desired inclination. It is held in position by a ratchet and pawl. The barrel is driven through bevel gearing, as shown. These barrels are made of wood, steel or brass, the ordinary size being 29 inches dismeter at the bottom, 24 inches at the top and 26 inches deep inside.

PLUMBING and GAS FITTING.

Pennsylvania Plumbing Law.

A bill introduced to the Legislature at Harrisburg, Pa., to establish a Bureau of Plumbing and House Drainage in all cities of the State has already passed the first reading in the House. The bill places the bureau under the supervision of the Department of Public Safety, and makes it the duty of the director of the department to appoint one or more suitable persons as inspectors for the bureau, the compensation of such inspectors to be fixed by the councils of the city in which the bureau has been established.

The inspectors are to pass upon applications of persons who desire to engage in or continue the business of plumbing, gas fitting and house drainage, and if they find the applicant competent, to report to the Director of Public Safety, who shall issue a certificate to the applicants, permitting them to conduct the plumbing business.

The inspectors are also required to examine all buildings in the city to determine their condition as to the plumbing, gas fitting, drainage and ventilation, and when the work is found defective they shall have power to order the removal, substitution or repair of the condemned material or work if it is not done by the owners within 15 days after notification.

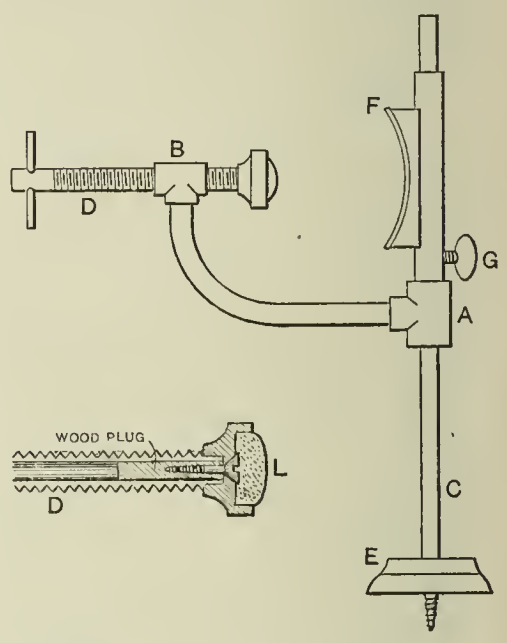
Any person refusing to admit the inspectors upon his premises for the purpose of examining the plumbing or drainage shall be deemed guilty of a misdemeanor, and, upon conviction, for each offense shall be subject to a fine not exceeding $100, and in default of the payment of the fine shall be liable to imprisonment not exceeding 30 days.

House Drainage Inspection.

Chief Inspector of House Drainage George P. Hughes of Philadelphia has made his annual report. It shows that plans for 4787 new and 17,414 old buildings were approved. The total number of inspection visits made during the year was 50,313, and there were referred from the nuisance division of the bureau to the house drainage division complaints involving 662 buildings, of which 619 were inspected and reported to the Board of Health with a recommendation for their abatement.

"The business of this division during the year," the report reads, "exceeded that of any other year since its organization. The greatest amount prior to this was in 1893, when 17,231 plans were approved, while this year the number was 22,201, an increase of 4970 over 1893. This was direct revenue to the city through the division of $22,201. The large increase in business, owing to the demand, was the cause of shipments to this market of large quantities of inferior material, principally iron pipe fittings, which were promptly condemned and removed from the work. In order to detect the character of material the inspectors were each furnished with a pair of registering calipers by which the thickness of the pipe or fittings might be determined. As a consequence of the close inspection of the material, the inferior kind is now rarely found on the work.

"The work constructed extended over the entire city and county, and as the inspectors' time is entirely occupied in responding to applications for the inspection of work under construction, opportunities were offered, and in many instances embraced by a certain class of plumbers, to violate the rules of the board. After a short time, however, these violations were discovered and, with the co-operation of the owners, they were corrected and the work made to conform to the rules at an expense of hundreds of dollars to the violators, which has had a salutary effect."



A Handy Pipe Holder.

BY OLIVER TWIST.

This is a tool that every plumber will appreciate, and one which every one may make for himself with very little trouble and expense. They are intended to take the place of a half dozen bricks or so, which have been used from "away back" by plumbers to hold by their weight two or more pieces of pipe from moving while the joint was being wiped. The bricks often had a fashion of taking a slide just when they should have been immovable, and consequently were responsible for considereble "cussin'." Referring to the illustration, A is a tee $\frac{3}{8}$ x $\frac{1}{4}$ inch. B is a tee $\frac{1}{4}$ inch. Take a piece of $\frac{1}{4}$ inch pipe and bend it as shown to connect these two tees. Leave about $3\frac{1}{2}$ inches between B and F, so that when finished they will allow a 2-inch pipe to pass through easily. Cut a $\frac{3}{8}$-inch nipple about 4 inches long with a thread on one end only, and screw into A. Take a piece of sheet brass or lead 1 inch wide and $2\frac{1}{2}$ inches long, cut into an oval shape and curve a little and solder it to the $\frac{3}{8}$-inch nipple, as at F. To make a thumb screw as shown at G, drill a hole $\frac{1}{4}$ inch in diameter and tap it to fit a $\frac{1}{4}$-inch stove bolt and solder on a small piece of sheet brass to give a hold for the fingers to turn it.

This allows the vise to slide up and down the standard C to suit the work. C is a piece of brass, or iron pipe, that will pass through the $\frac{3}{8}$ inch nipple freely and is 10 inches long, being tapped into a flange to form a base. Now take $1\frac{1}{2}$ inch screw nail, cut off the head and solder the remainder into the end of the pipe C, where it comes through the flange E, as shown. D is a piece of pipe 5 inches long, having a $\frac{3}{16}$-inch hole drilled through it, $\frac{1}{2}$ inch from one end, through which is put a piece of wire 2 inches long and the end of the pipe filled with solder. It is threaded up 4 inches, so as to screw easily through the tee B. At the left of the sketch is an enlarged view showing how to fix the cap on the end, the cap being nothing more than the stuffing box of an old basin cock. To fix it to the nipple D, file off the thread for $\frac{1}{2}$ inch back from the end and drive in a wooden plug. Then, by means of a screw and washer, the cap may be fastened to the nipple so that it turns freely. A thick leather washer is then placed in the recess, as at L, thus preventing the lead pipe from being bruised.

Three of these holders form a set, so that branch joints may be wiped. When in use the standard C is screwed into 1-inch board or the work bench, and the remainder slipped down over this and fastened by the thumb screw G, at any hight. To wipe an upright

A Handy Pipe Holder.—General View with Enlarged Sectional View of Clamp.

joint screw them into the wall. With a little practice they will be found adaptable to all requirements.

TRAPS AND VENTS.

BOWEN & BEACH, Medina, N. Y., are sending circulars to the plumbers of their improved vent cap, which fits light or heavy soil pipe and is attached without calking or screws.

THE PLUMBER will find a very handsome new bathtub supply and waste on exhibition in the showroom of the Henry Huber Company, 81 Beekman street, New York. The fixture is quite elaborate and is placed entirely outside of the tub, resting on a tripod, with an ornamented curved supply to discharge the water into the tub. It is very attractive and one of the very latest bath fixtures.

THE MASTER PLUMBERS' ASSOCIATION of Philadelphia has sent to the Legislature at Harrisburg, Pa., a petition asking that the plumbing law now before that body be changed so that it will in no way affect the act of 1885, which is satisfactory alike to plumbers, builders and the public. Secretary Harkness and several members of the Philadelphia Master Plumbers' Association have spoken before the legislative committee in support of their petition.

MCINERNY & HICKEY have been granted a plumbing license at Minneapolis, Minn.

EDWARD F. GOULD, the New York representative of the Pittsburgh Brass Company, Pittsburgh, Pa., is showing

the plumbing trade a handsomely nickel plated comb and brush bracket as one of their many bathroom specialties.

A BILL has has been introduced in the Michigan Legislature to regulate and control plumbers and plumbing in that State.

WM. M. OCKERMAN has begun business at Greenville, Ohio, and will do all kinds of tin, copper and sheet iron work, plumbing and pump fitting.

FRANK PARKE, Twenty-third avenue and Eighth street, Meridian, Miss., is an ambitious young mechanic whose enterprise ought to insure him the success he is seeking. He is but 16 years old and has already launched out for himself in sheet metal work, and is prepared to do small, simple jobs of plumbing. He issues a circular addressed to the public under date of January 15, in which he asks that they give him a trial.

J. W. COMMERFORD, Joplin, Mo., has bought out the business of J. D. Kane snd likewise taken the business of the Joplin Water Works Company, he having been connected with the latter concern for some years as foreman of the plumbing department.

OF THE 52 master plumbers in the city of Rochester, N. Y., says a local paper, but two have complied with the statute which requires that they renew their licenses the first of the year. Those who have violated the law are liable to prosecution by the Health Department. It is required by law that every master plumber in Rochester shall first pass an examination before the Board of Plumbing Inspectors and then secure a license from the Executive Board, after which a certificate must be secured from the office of the Board of Health. The certificates are renewed without cost.

J. H. & W. H. RILEY succeed Shumway & Riley in the plumbing business at Northampton, Mass.

J. DILLON, Doylestown, Pa., is using a new cellar drainer in the houses of some of his customers.

THE IOWA STATE MASTER PLUMBERS' ASSOCIATION met last week in annual session at Burlington, Iowa, with about 30 delegates from various cities of the State. The meeting was called to order by President J. A. Harris of Des Moines. The Mayor of the city made an address of welcome, and other addresses were made by President Harris and President H. D. Crane of the National Association of Master Steam and Hot Water Fitters of the United States, and Mr. Aherns, State president of the same association. The second day of the meeting was consumed with routine work, the chief of which was the election of officers. Those selected are : President, Henry Ewinger, Burlington; vice-president, Robert Clayton, Davenport; secretary, John E. Allen, Des Moines; treasurer, P. J. Barry, Muscatine. The delegates were entertained by the local plumbers with a banquet.

BARRETT & WALLACE, Cohoes, N. Y., tinners, plumbers and jobbers, have moved their place of business to 220 Remsen street.

DETROIT is considering the erection of a $60,000 public lavatory on the Campus Martins, which will be an imposing structure, heated by steam.

KING & HYLAND COMPANY have been incorporated at Chicago, with a capital stock of $10,000, to manufacture plumbing and gas fitting apparatus. The incorporators are John A. King, Michael S. Hyland and Robert J. Bieg.

JOHN D. ELLIOTT, George F. Tobey and William Deacon have made application for civil service examination as inspectors of plumbing at New Bedford, Mass.

WILL ADAMS of Dryden, N. Y., and Fred. Bauchle of Owego have formed a copartnership and rented the Bouton shop next the town hall on South street, Dryden, N. Y., where they will carry on a general business as practical plumbers, tinners, and general jobbers in hot water, hot air and steam heating apparatus.

HOWARD W. GEIST and Daniel K. March have associated themselves in the plumbing, tinning and stove business at 453 High street, Pottsville, Pa.

W. G. WATERS has recently opened a plumbing establishment at 114 Grand avenue, New Haven, Conn., and already has the plumbing contracts on a number of houses in that section. He will handle the Page steam heaters and will make a specialty of oil and gas heaters.

ROCKVILLE, CONN., has taken steps to secure a system of sewers, so it is reported by the New Haven *Record*.

J. E. JACKSON of the firm of Jackson & Longton, Rhinelander, Wis., was elected sergeant-at-arms of the Wisconsin State Association of Master Plumbers. A wrong address for his firm was accidentally given in our report of the recent convention.

THE TORONTO STEEL CLAD BATH & METAL COMPANY, LIMITED, and the Booth Copper Company of Toronto send out conjointly a serviceable reminder of their concerns in the shape of a calendar desk pad, on each sheet of which are places for four memoranda, the spaces carrying the day of the month, week and year. There is also reference to the Resisto copper boilers and the Steel Clad baths.

THE COPARTNERSHIP existing under the name of F. D. Dumond & Son, plumbers, 25 South Clinton street, Rochester, N. Y., has been dissolved by mutual consent, the business to be continued by A. A. Dumond at the same address.

THE selling of a mixture of common metals for a high grade aluminum alloy was recently brought to light, and illustrates the means that are taken by unscrupulous persons to get a little money at the expense of the reputation of this new metal. Aluminum has had widely extending uses during the past year or so, since its price has been brought within reasonable limits, and has been largely employed in the manufacture of kitchen utensils and certain sanitary articles. We hope that there will be no other cases of imposture, and that goods sold as all or in part aluminum may not be cheap alloys that will soon tarnish and be unsatisfactory for the purposes to which they are put.

IMPORTANT REDUCTIONS have been made in the prices of Mott's Imperial porcelain, Colonial and Yorkshire ware. By reason of largely increased means of production, the J. L. Mott Iron Works of New York and Chicago are enabled to announce substantial reductions in the prices of their Imperial porcelain, Colonial and Yorkshire ware, bathtubs, sitz baths, sinks, wash trays, &c. These articles are the perfection of cleanliness and durability, being molded in one solid piece of glazed porcelain about 1½ inches thick. Circulars announcing the reductions are being mailed.

CAPT. ANSON WITHEY has formed a partnership with J. E. Hubbard in the plumbing business at Greenfield, Mass.

HARRY A. BLACK PLUMBING COMPANY, Chicago, have been incorporated with a capital stock of $5000. The incorporators are W. D. Anderson, Conrad Kohler and Charles Daft.

A VERDICT has just been rendered in the New York courts which ought to help along the cause of tenement house reform. The plaintiff in the case hired a tenement of the defendent which proved to be in bad sanitary condition, in consequence of which condition the plaintiff lost two of his children. He brought suit for damages against the landlord and recovered $2000.

PLUMBERS' LICENSES have been granted to John J. Keilt, John P. Langew and James J. Gorden to make connections with the water mains of Jersey City, N. J., also to do general plumbing work.

THE COLWELL LEAD COMPANY, 63 Centre street, New York, have secured a building on Worth street which they will use for the storage of sanitary goods and earthenware. This building is connected with their offices and salesroom on Centre street by a bridge. They now have a frontage on three streets, the entrance to their sheet lead and lead pipe mill being on Pearl street.

ONE OF THE NEWEST BATHTUBS on the market is made by R M. Wilson, Rome, N. Y., and is on exhibition at the New York salesroom, 92 Walker street. The tub is made of sheet copper of ample strength to support the weight of a bather. It is heavily tinned on the inside, and on the outside the copper is cleaned and presents its natural color, being protected from the atmosphere by a coat of durable varnish. It is supported on bronzed cast iron legs of ornamental design and has a wood rim. It is provided with a waste and overflow and arranged for standard bath cocks.

SOME NEW THINGS in bathtub decoration are shown in the sample rooms of the J. L. Mott Iron Works, Beekman and Cliff streets, New York. The ornamentation is of the relief character, artistic in design, with the effect made brilliant by the highest points being touched with gold.

A BILL has been introduced in the New Jersey Legislature to reduce the price of gas to $1 per thousand. A contractor before the committee stated that gas could be profitably made at less than 50 cents. Representatives of the gas companies asked that the report of the committee be delayed one week to enable them to speak fully on the measure.

JOLIET SUPPLY COMPANY have been incorporated, at Joliet, Ill., with a capital stock of $20.000, to deal in plumbers' supplies. The incorporators are William Douglas, Joseph E. Ralph and Charles W. Munn.

THE BOARD OF HEALTH of Waco, Texas, has been petitioned to take action to secure a plumbing inspector for the city, and a committee has been appointed to investigate and report on the subject.

Standing Committees of New York Plumbers.

The various committees of the Association of Master Plumbers of New York for 1895 are as follows :

PROTECTION.

Wm. McDermott.
J. S. Lindsay.
A. H. Brown.
Samuel Malcolm.
John Spence.

CONFERENCE.

J. Gillroy.
H. J. Pattison.
T. J. Cummins.
J. W. O'Brien.
Alexander Bryant.

TRADE SCHOOL.

Edward Murphy.
Col. George D. Scott.
James Muir.
Frank Reynolds.
Thomas J. Tuomey.

AUDITING.

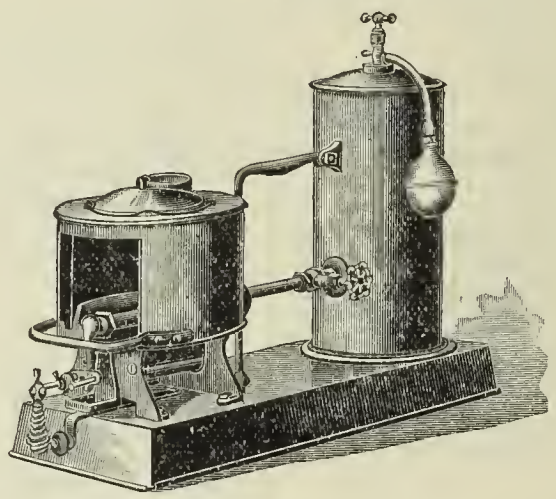
New Publications.



HAND BOOK OF PRACTICAL MECHANICS. By Charles H. Saunders, Ph.B., Yale. Size 4 x 6 inches; 116 pages; published by the Student Publishing Company, Hartford, Conn., 1895. Price $1.

Mechanics and those interested in the building and running of machines will derive much assistance from this little volume, which contains in compact form a large amount of useful information. Great care has been taken in the work to simplify the calculations so far as possible, and in addition to what is of particular reference to machine shop work, there are other rules and formulas of wider interest. The book, for instance, begins with rules for calculating the bursting pressures of cylinders and pipes. The full title as given on the first page indicates the scope of the work. It describes a hand book of practical mechanics for use in the shop and drafting room, containing tables, rules and formulas and solutions of practical problems by simple and quick methods. Logarithms, sine, cosine and tangent tables, areas and circumferences, decimal equivalents of an inch, a foot and a pound; bevel and spur gears, worm and worm gears, United States standard bolts and nuts, tapping drills, lathe thread cutting, cams, &c.

The tide of emigration still sets eastward, the number of steerage passengers leaving New York by the transatlantic lines this month having been larger than the arrivals. This has been the case for several months, leaving the balance of trade in immigrants, so to speak, against the United States.

Canners' and Tinners' Furnace.

The Burgess Soldering Furnace Company, Columbus, Ohio, are placing on the market a new combination furnace, Gem No. 8, which is shown in the accompanying illustration. It is especially adapted for canning factories and for heavy work. The opening in hood of furnace will accommodate two 3-inch capping irons, and by removing the top cover will also accommodate the one or more tinners' soldering coppers that are used in connection with capping irons. The plate on which the coppers rest is made of cast iron deflected with projections which form flues for conducting heat under same. The sides are also equipped with flue plates which protect the bolts and conduct heat from front to rear of hood. The slotted burner is cylindrical and made of heavy cast iron, the shape being such that solder cannot fall into the perforations.

Canners' and Tinners' Furnace.

The heat is distributed the full length of the irons, and the burner being recessed in front and back insures durability. It is also furnished with a sliding drip cup, the knob of which is always cool. The plate on which the coppers rest is but a few inches from the workman's bench, an advantage to which special attention is directed. The reservoir shown is pneumatic and fireproof, which cannot be filled while the burner is lighted, thus avoiding accidents. It is made of IXXXX tinned steel or copper, and holds 2 gallons of gasoline, sufficient to last several days. The patent rubber bulb used on this furnace is made of heavy black rubber, the valves of which are located between bulb and tube. The air, oil and regulating valves are all furnished with stuffing nuts. The regulating valve is supplied with an Alaska handle, which always remains cool. The base on which the furnace and reservoir rest is made of refined steel. The manufacturers state that these furnaces are used by a number of the leading canning factories, and are giving the best of satisfaction. They also add that this furnace can be used by tinsmiths and roofers, and is guaranteed to work out of doors in all kinds of weather.

The system of street railway mail service has proved so successful in several cities that the Post Office Department intend adopting it in all the larger cities of the United States.

News and Notes.

The American Flint Glass Workers' Union is making arrangements to start plants of its own in different parts of the country on a co-operative basis.

The journal of the Statistical Society of Paris points out the fact that, notwithstanding the large bounties it enjoys, the shipping industry of France is showing a serious falling off. The tonnage of vessels sailing under the French flag decreased from 9,704,191 tons in 1891 to 8,382,311 tons in 1893. In 1894 the situation was no better, so far as could be judged from the returns for the first nine months of the year, which showed a decrease of 6 per cent. as compared with the same period of 1893.

In Chicago last week Judge Grosscup handed down a very important decision in the suit of the Thomson-Houston Company *vs.* the Western Electric Company, for infringement of their patent for an automatic regulator of dynamo electric machines. These regulators are used on all dynamo electric machines, and the Thomson-Houston Company had the right to sell the important device, the patent for which was valued at $2,000,000. In the opinion of the Court it was held that the Thomson-Houston patent is invalid, on the ground that it possesses no novelty in view of an earlier patent for a similar invention which "discloses a device almost identical with that of the patent in suit."

The cycle industry is referred to as being one of the most flourishing industries in France at the present time. According to statistics issued by the French Ministry of Commerce, the total trade in cycles, both import and export, last year, aggregated in value about $2,000,000.

A strong opposition exists in Philadelphia to the present plans for the new railway bridge over the Delaware River.

State Engineer Adams, in his annual report just submitted to the New York State Legislature, advocates the deepening of the Erie and Oswego Canals to 9 feet, and of the Champlain Canal to 7 feet, as well as the lengthening of the single locks on the canals. In treating of electricity as a motive power he asserts that greater speed and economy of towing can only be obtained by this medium.

The Brooklyn *Eagle* estimates the net weekly loss caused to the city of Brooklyn by the recent street railroad strike at rather over $1,000,000.

TIN PLATES.

A Tin Plate Suggestion.

The following, which has reached us from a correspondent firm in Vermont, contains a hint which it seems might be profitably taken by domestic tin plate manufacturers and dealers:

We would like to make a suggestion through *The Metal Worker* for the interest of the buyer of American tin plates, as well as for that of the manufacturer and seller of the same, and it is this: That the different houses that sell American tin plates send to their customers circulars or pamphlets of all the American tin plates they have to sell, with prices of same, welght, sizes, &c., and their relative merits as compared with the standard imported plates, such as the Melyn, Allaway, Steel Coke or B. V. grade, as quoted in *The Metal Worker*, for bright plates, and M. F., Pontymister, Worcester, Dean, Abercarne, &c., grades in roofing plates. We believe that most of the American tin plate buyers are still ignorant of the real merits of the American made plates; at least they are not nearly as well posted in regard to them as they are on the imported plates. I know that we plead ignorance in this respect, although we do not buy as many plates now as a few years ago, and wish for more light on the subject. We believe this will work for the benefit of Americans, both buyers and sellers.

A Correction.

Respecting an item that appeared in *The Metal Worker* last week, which purported to quote the opinions of John Jarrett, secretary and treasurer of the Tinned Plate Manufacturers' Association of the United States, as expressed in the New York *Herald*, of January 21, we have received the following letter from Mr. Jarrett, which we print below:

I was very much surprised in looking over *The Metal Worker* of this week to find in the Scrap column of the Tin Plate Department an item that I had written to the New York *Herald*, giving as my opinion that, with the slight reduction in wages agreed to by the tin plate works, the American mills can be operated with a fair percentage of profit.

Permit me to say that I have not written to the New York *Herald*, nor have I at any time expressed myself in the manner indicated. On the other hand all through the wages controversy between the tin plate manufacturers and the Amalgamated Association I have steadfastly maintained that the manufacturers should secure the full reduction they had demanded to permit them to operate their mills at a low percentage of profit. The compromised wages accepted by a few of the manufacturers lately is not satisfactory and in my opinion will not secure remunerative profits to the mills and another adjustment of wages will be necessary at a very early day.

SCRAP.

FORD & DONNELLY, Kokomo, Ind., have placed in the tinning house of the Atlanta Steel & Tin Plate Company, Atlanta, Ind., four machines for cleaning tin plates by drawing them through bran. It is claimed that these machines will not only greatly reduce the amount of hand labor required in cleaning the tinned plates, but will clean them much better, a point which will be appreciated by consumers of tin plates for canning purposes. Ford & Donnelly now equip complete tinning plants, with the exception of mills. A machine they are at present working on is a tin plate polisher of double the ordinary capacity, yet occupying very little more space, and, we understand, not greatly exceeding in cost the single capacity machine. Plates passed through this machine come out, it is said, like burnished silver in five seconds of time.

IN giving his workmen notice of his intention to close down the Morfa Tin Plate Works, Llanelly, Wales, at the end of January, John S. Tregoning, the proprietor, said that the concessions recently made by the tin plate workers in the Llanelly district were not sufficient to enable the manufacturers to meet for long the local competition in America. The boxes of tin plates now stored at the Morfa works, he said, were not salable at a shilling off the cost of manufacture and he did not see his way to go on making plates at a loss.

WORK on the National Tin Plate Works plant, North Anderson, Ind., is reported to be progressing rapidly. The main building was finished this week, and the machinery and engine rooms are completed and under cover.

A DISPATCH rom Elwood, Ind., to the Cincinnati *Jommercial Gazette* states that since last week Chicago and Cincinnati capitalists who are interested in the manufacture of tin plate have decided to locate a five-mill plant between Elwood and Franklin, on the Quick City land syndicate's property. They made the syndicate the proposition to erect the plant, which will employ 300 men, provided a subsidy of $22,000 be raised for them. This amount has almost been raised, and every detail of the deal will, it is expected, be closed up shortly. The com pany intend to have the plant in operstion by August.

THE KRING LUMBER & SAW MILL COMPANY, Atlanta, Ind., are erecting a plant for the manufacture of boxes from native hardwoods. Machinery of latest design is being put in, and boxes of all kinds will be made, but boxes for tin plate will be their specialty. They have already contracted with the Atlanta Steel & Tin Plate Compsny for several months' supply.

ELLWOOD TIN PLATE COMPANY, Ellwood City, Pa., for whom Samuel A Sague, 206 and 207 Western Reserve Building, Cleveland, Ohio, is general agent, issue a quotation sheet of their Bishop brand of tin and terne plates. These include four grades of charcoal bright and one of coke bright plates, as well as four varieties of guaranteed terne plates.

J. A. BRUNER, who had charge of the tin plate sales department of the St. Louis Stamping Company, St. Louis, Mo., severed his connection with that firm on February 1 to enter the fire insurance business. Mr. Bruner will be connected with Charles L. Crane & Co., St. Louis, and his many friends will wish him abundant success in his new field.

THE AMERICAN TIN PLATE COMPANY of Elwood, Ind., have put in operation the new four-mill addition to their rolling mill.

THE MONONGAHELA TIN PLATE COMPANY, Pittsburgh, of which Senator M. S. Quay is a large stockholder, signed the Amalgamated Association tin plate scale last week. Some of the mills of this concern are expected to be put in operation on Monday, February 4.

THE PLANT of the Vulcan Iron Company, Limited, New Castle, Pa., manufacturers of rolling mill and tin plate machinery, is in operation to full capacity. Among contracts now on hand by this firm may be mentioned a new design of pickling machine for the Britton Rolling Mill Company, Cleveland, Ohio; two trimming shears for the Montpelier Sheet & Tin Plate Company, Montpelier, Ind.; two patent rod reels for the New Haven Rolling Mill Company, New Haven, Conn.; all the cast iron work for 18 sheet mills, pair furnaces and an annealing carriage for the Monongahela Tin Plate Company of Pittsburgh, Pa.

THE ELLWOOD TIN PLATE COMPANY, Ellwood City, Pa., will accept the Amalgamated Association compromise scale, providing for a reduction of 15 per cent. on rolling and 12½ per cent. on heating and doubling on common gauges. This plant, however, will be operated on a non-union basis, and the Amalgamated Association scale will not be signed.

IMPORTANT INTERESTS having joined with the New Castle Tin Plate plant, at New Castle, Pa., the same will be very largely increased. It is reported that a large New York importing firm and a leading can manufacturer of Chicago have become interested.

THE PHILLIPS TIN PLATE COMPANY, Philadelphia, advise us that they have abandoned the word "Waldo" as a brand name for one of their grades of roofing plates, that name having been in the market for some years. It has been replaced by their new brand, "F. R. P. Extra," which is the best palm oil process roofing plate made by the firm.

THE ENTIRE PLANT of the Scottdale Iron & Steel Company, Limited, Scottdale, Pa., manufacturers of iron and steel sheets, is in full operation, and prospects for the future are very encouraging. The equipment of this plant is being increased by the addition of another cold rolling mill, which is ex-

pected to be in operation in about a month. This concern are experimenting with the use of coke for fuel in their heating furnaces, with a view to determining the relative cost of coal, which may be displaced if the experiment is satisfactory, so far as regular and sufficient heat is concerned.

THE AMERICAN TIN PLATE WORKS are rapidly falling again into the line of activity, some after signing the Amalgamated Association scale, and others, on a non-union basis, by local arrangement with their employees. At present about three-fourths of the total productive capacity of the domestic tin plate plants are running, and more works are on the point of starting up. The tin plate wage trouble is, in fact, practically at an end. The last idle firm of the Tinned Plate Manufacturers' Association, the Ætna Standard Iron & Steel Company of Bridgeport, Ohio, are reported to have signed the compromise scale of the Amalgamated Association a day or two ago, and their mills, which are among the largest in the country, will be again in operation in a few days.

A PRESS DISPATCH from Pittsburgh announces that another conference of tin plate workers and their employers will soon be held, with the view, through mutual concessions, of removing the obstacles which still prevent some of the manufacturers from coming to terms with their workmen and starting their idle mills.

SEVERAL MORE Welsh tin plate works have been closed down this week, including those of the Mansel Tin Plate Company, Port Talbot; Glanbeudy Tin Plate Company, Brynamman, and Llansamlet Tin Plate Company, Worcester, Swansea. The situation of the industry in South Wales is regarded as very unpromising.

RUMORS are prevalent of impending heavy failures in the Welsh tin plate trade. The financial position of two large works in South Wales, of which the names are not given, is said by latest reports to be very precarious; and the failure for $400,000 of a leading merchant in that district connected with three tin plate mills is announced. Fears are entertained that this may be followed by the collapse of other tin plate concerns.

THE FALCON TIN PLATE AND SHEET COMPANY, Niles, Ohio, have accepted the Amalgamated Association compromise scale and the plant of this concern, which has been idle for sometime, resumed operations on Monday, the 29th ult., with a good volume of orders.

THE CUSTOM HOUSE RECORDS of San Francisco show that the imports of tin and terne plates at that port during last year amounted to 23,857,008 pounds, valued at $671,596 This exhibit indicates a falling off of nearly 50 per cent. as compared with 1893. The decrease is attributed to heavy stocks left over from that year.

MERCHANT & CO. (INC), of Philadelphia, New York and Chicago, have issued a bright illustrated card advertising their Tandem continuous roofing tin. A man is represented in the three stages of sleeping, waking and being wide awake, which are adroitly worked in as a direct appeal to the reader. The advantages of the Tandem tin are then tersely and takingly set forth.

Labor and Public Carriers.

The Brooklyn trolley car strike has brought out a flood of confused utterances in the public press, both editorially and through correspondents, says *The Iron Age*. There has been a good deal of weak sentiment and very little calm reasoning. There has been much dilly-dallying with serious issues and altogether too little vigorous action and emphatic talk. No sharp, clear presentation has been made of the rights and the responsibilities of the three parties to the contest. When companies operating under charter from the State are performing a service for the general public, the situation is radically different from that involved when there is a disagreement between a private employer and his men. A third party intervenes, which has its rights and its duties, and that is the public as represented by local or State government. The carrier derives special privilegcs through the grant to him of a complete or partial monopoly, and incurs responsibilities which should be clearly defined. He has duties to perform as against the other two parties, the employees and the public. Reciprocal obligations rest with the employees, who share with the employer his responsibility as to the public.

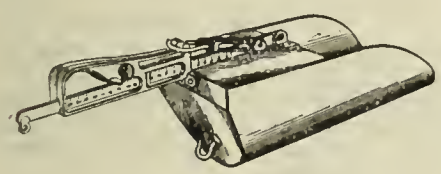
It may be acknowledged that hitherto both companies and men have usually proceeded on the assumption that their relations were simply governed by their own will. In the Brooklyn strike the rights of the public have been asserted and that in a way which needs very sharp correction. Judge Gaynor has undertaken to define them. He may have correctly interpreted the law. If he has, the laws must be subjected to a thorough modification. It would be a crying injustice if public carriers were to be bound to perform their service without any reference whatever to their relations with their men.

The great trouble which lies at the bottom of the whole matter is that one of the three parties is absolutely irresponsible, and that is the body of men who constitute the operatives. They are not collectively or individually responsible financially. If organized, their leaders, or the majority of their members, have not power enough over the bad element to prevent violence and breaking of the peace, even though they must know that such behavior is the worst that can befall their cause.

Apparently the only party which can be held readily to the full measure of its responsibility is the common carrier. Its capital is fixedly invested. Its property is tangible and easily seized, and apparently the socialistic trend of some of our modern judiciary prefers to move against it as offering the line of least resistance.

The assertion of the rights of the public in matters of this kind is all very well and good, but those rights can only be maintained when the obligations with which they are coupled are fully met. The principal of these obligations is the maintenance of peace, which the men share, and the full protection of the other parties in interest, which rests with the Executive as the representative of the people. In Brooklyn that protection was not afforded and for that reason no compulsory measures against the public carriers are justified.

As it is, the utter irresponsibility of one party makes the questions at issue difficult of solution. It has been suggested that both employers and employees who are engaged in service of a public character should not abandon their work without giving ample notice. Such a condition would be valuable as a protection to the public, but there is no means whatever for enforcing it upon the men. They could not and would not give any bonds as security for the performance of such a contract, any more than they do now for the carrying out of one of the most fundamental duties of every citizen—that of keeping the peace. It is evident, then, that where no guarantees of good behavior whatever exist, the only course is the sharpest compulsion, sharper by far than that which has characterized the action of municipal and State governments in the Chicago and the Brooklyn strikes.



Building Operations in 1894.

The returns of the Department of Buildings of the City of New York for the year ending December 31, 1894, present, says *Carpentry and Building*, an interesting study, showing, as they do, the variety of buildings for which plans and specifications were filed, and also the amounts involved in their erection. Considering the extreme business depression during the 12 months covered by these returns, and the gloomy outlook at the beginning of last year, the figures cannot fail to be regarded as better than generally expected. True it is that the total valuation of building operations for 1894 falls a little short of 1893, but on the other hand, the number of plans filed with the department shows an increase of several hundred, which brings the average cost per building considerably lower than for 1893, when it was the highest on record. The returns of the Department of Buildings show that during the past year 2583 structures were planned to cost $51,673,997, as against 2284 buildings, costing $54,859,318 in 1893. Considering first the private dwellings, we find that there were 1149 for which plans and specifications were filed, estimated to cost $10,981,095, this being an increase over 1893 in the number of dwellings projected, but representing a slight decrease in the valuation. Of flats and tenements there were 777 projected in 1894, calling for an expenditure of $18,020,500, while for hotels, stores, churches and school houses 181 permits were granted, the amount involved being $9,759,945. The number of office buildings planned last year was 21, being just half the number in 1893, but costing nearly the same. Of workshops and manufactories there were 88 projected last year, estimated to cost $3,399,550, while in 1893 there were 141 projected, estimated to cost $3,296,400. The plans filed for miscellaneous buildings, stables, &c., numbered 367, calling for an outlay of $2,944,757. Of this number 19 were for places of amusement, estimated to cost $1,373,700. The plans and specifications for alterations to buildings filed and acted upon by the Department during the past year numbered 1902, estimated to cost $4,888,610. These latter figures as compared with 1893 show a heavy decrease, especially in the amount of money involved.

THE RETAIL STORE.

Combined Scoop and Scale.

G. Sanger, 4110 Pennsylvania avenue, St. Louis, Mo., is placing on the market a combined scoop and scale, as illustrated herewith. The mechanism for weighing is ingeniously arranged,

Combined Scoop and Scale.

and can be used as a scoop separately. There is a hook attached to the bottom of the scoop for weighing meats or bulky packages of any kind. The device is strongly made, and is graduated to weigh from ⅛ ounce to 4 pounds.

Tubular Steel Wheelbarrows.

The wheelbarrows shown herewith, adapted to dirt, coal, coke and ashes, are offered by the Kentucky Mfg. Company, Covington, Ky. The manufacturers remark that in the construction of tubular steel barrows the best material and skilled labor are employed. It is

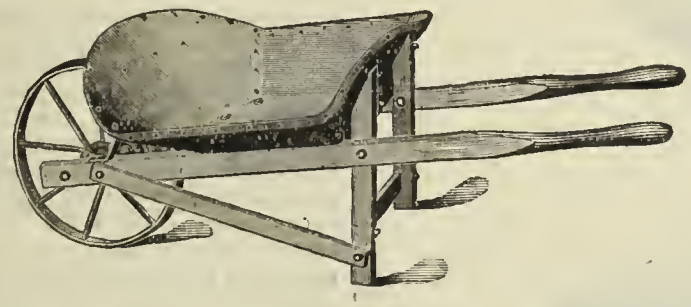


Fig. 1.—Dirt or Canal Barrow.

explained that the trays are made in a substantial manner, with a band of iron securely riveted around the top part, and that the corners are made double where the greatest strength is required. The Howell suspension steel wheel is used on all the company's barrows. In addition to the barrows shown the company make tubular steel barrows adapted to dirt, canals, mining, foundries, rolling mills and pig iron. It is stated that the tubular frames with steel cross bars are so constructed that the tray can be easily adjusted in a workmanlike manner, thus making light, strong and durable barrows.

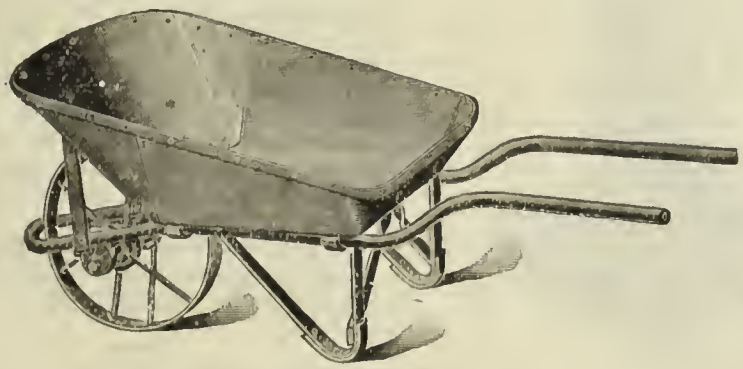

Fig. 2.—Coal Barrow.

MEMORANDA.

SILVER & Co , 304–314 Hewes street, Brooklyn, N. Y., are paying very close attention to the development of new goods in aluminum this season. They have now increased their line of Brooklyn pure aluminum specialties to about 30 articles, and propose to extend their efforts in this direction still further. Messrs. Silver report a very gratifying growth in the demand for aluminum household ware as its merits become more generally appreciated. In order to provide adequate facilities for their growing business in aluminum goods, the firm propose making some important additions to and improvements in their factory at an early date.

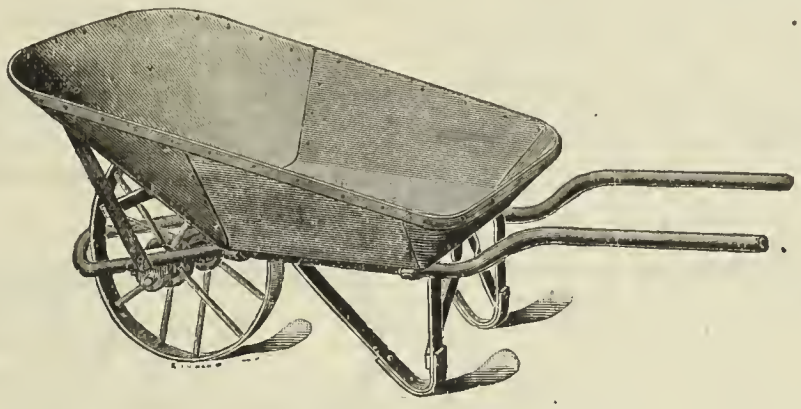

Fig. 3.—Coke or Ash Barrow.

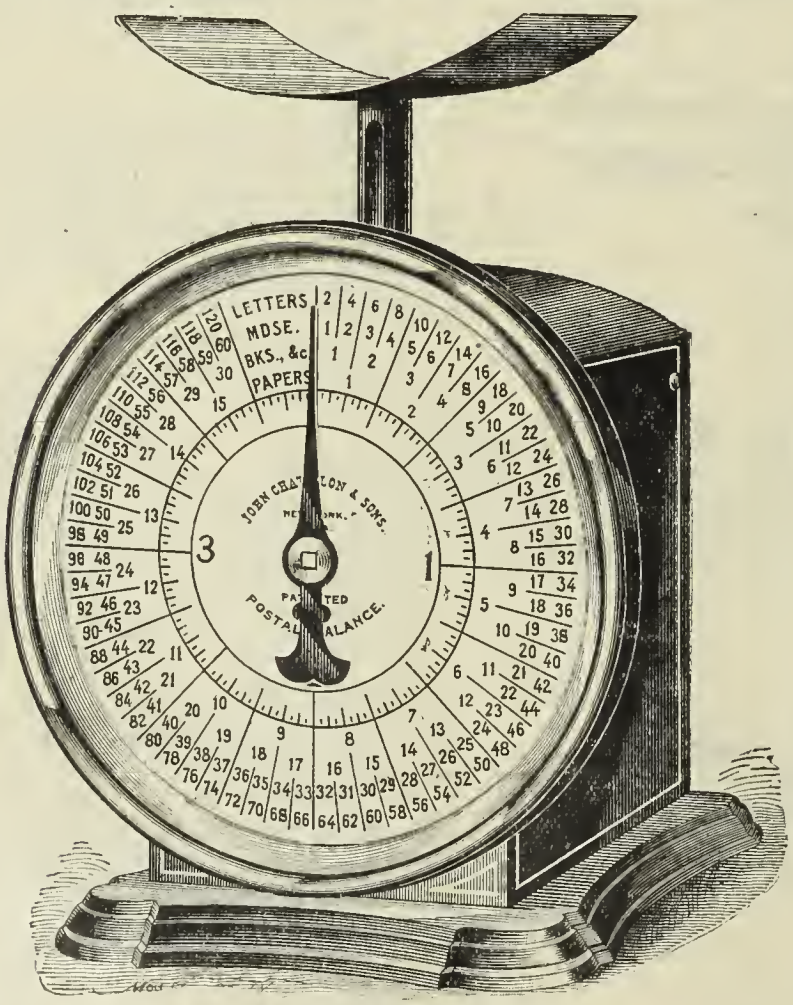
THE FIRM of White & Porter, Bristol, Conn., dissolved on January 14, Mr. White continuing at the old stand, while Mr. Porter, with his son, under the title of J. M. Porter & Son, will open a stove, furnace, tin and plumbing store on Main street.

THE MICA MFG. COMPANY will, on and after February 1, be located at 88 Fulton street, New York City. An illustrated catalogue, published by this firm, contains cuts of a very great variety of mica goods which they manufacture and sell. These include all sorts of canopies for gas and lamps, besides shade protectors, chimneys, screens, &c.

THE LAWRENCE & MCDOWELL COMPANY of Moira, Franklin County, New York, have been incorporated with a capital of $10,000 to manufacture tinware and do a general plumbing and hardware business. Directors: W. A. Lawrence, Helena Lawrence and David A. McDowell of Moira.

NORTH BROS. MFG. COMPANY, Philadelphia, Pa., John H. Graham & Co., 113 Chambers street, New York, agents, issue an 1895 catalogue devoted to Ice Cream Freezers, Ice Chippers, Freezer Clamps, Ice Shaves, Meat Cutters, Scales, Beaters, Cake Pans, Cake and Batter Mixer, Candlesticks, Fluting Machines, Hand Fluters, Wringers, Tobacco Cutters, Tobacco Shaves, Faucets, Christmas Tree Holder, &c. The company call attention to the advance in the list prices of original Knox Fluters to the same list as Crown Fluters, and to the revision of the list prices of repairs for Ice Cream Freezer and Fluting Machine repairs.



THE STAR MFG. COMPANY, established two years ago at Canton, Ohio, manufacturers of the Crystal Valve Oil Can, have concluded arrangements by which they become successors to the F. B. Smith Novelty Company, and will in the future manufacture the Smith Novelty Force Pump, brass and aluminum kitchen ware and advertising novelties. They will occupy the premises formerly used by the F. B. Smith Novelty Company, at East Fourth street, which are furnished with facilities for manufacturing a full line of hardware specialties. At the annual election, held January 25, the following officers and Executive Board were chosen: President, J. A.

Brobst; vice-president, F. H. Wagner; secretary and treasurer, Frank Schwerter; superintendent, J. Kawer. C. C. Bow is also a member of the Executive Board.

The Bowen Mfg. Company, Fond du Lac, Wis., have made a change in the exterior ornamentation of their refrigerators. They have introduced more elaborate carving on the door panels, inserted the name of the refrigerator on the ice chamber panel, with appropriate scroll work, and added bolder designs on frieze and skirting, with the result of greatly improving the appearance of these goods.

New Favorite Postal Balance.

John Chatillon & Sons, 85 93 Cliff street, New York, have brought out the New Favorite postal balance as here illustrated. The body is made of sheet steel, japanned and decorated in gold and other colors. A white dial with distlnct large black figures is protected by a glass front in a brass nickeled frame. It will be noticed the figures, which are ⅛ inch long, are not inverted in the lower section, to conform to the circle, but so placed as to be correctly read at a glance. The outer circle of figures indicate the postage in cents for first class or sealed matter, as letters, &c., in multiples and fractions of weights. The same principle applies to the remaining circles of numerals on merchandise, books, &c., and papers, all showing the postage for the different classes or sub-divisions to any part of the United States, Canada or Mexico. The inner circle is graduated to the capacity of the scale by

New Favorite Postal Balance.

⅛ ounces to 4 pounds avoirdupois. The pan at the top is nickeled brass. The adjustment of the pointer is made by a thumb screw on the top of the scale. The material used in the construction of the scale is at once strong, light and attractive. The outside dimensions are: Hight, 10 inches; depth, 7½ inches, and dial, 7 inches. It is numbered 026 L, and each scale is packed separately in a dovetailed wood box with slide cover.

New Can Openers.

The Brown & Dowd Mfg. Company, Meriden, Conn., have just brought out a new can opener, which will be put on the market under the name Queen, and a new comblnation can opener and corkscrew, which will be known as the King. They are represented in the illustratlons given herewith. These tools are described as struck from a single piece of steel, to which a blade of cast steel, tempered, is securely riveted, and in the combination tool the corkscrew is tempered steel wire and is made wlth special reference to lightness and convenience. These tools, it is claimed, will work in any direction, and are put out as examples of neatness and lightness combined with necessary strength and low cost. The corkscrew, as will be noticed, when not in use may be shut into the handle, and when in that position does not in the least interfere with the use of the can opener. The King is finished in nickel plate and the Queen japanned.

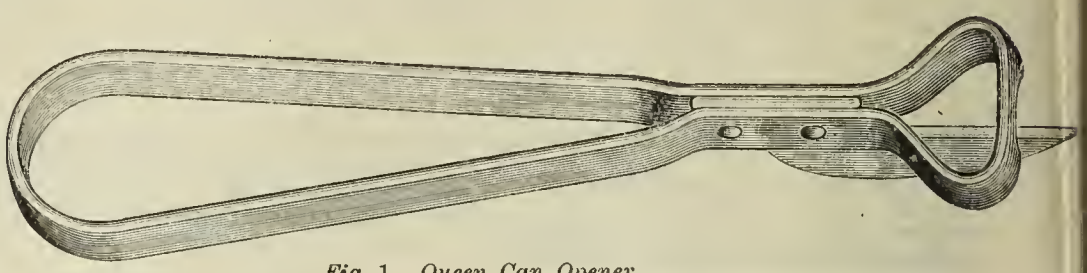


Fig. 1.—Queen Can Opener.

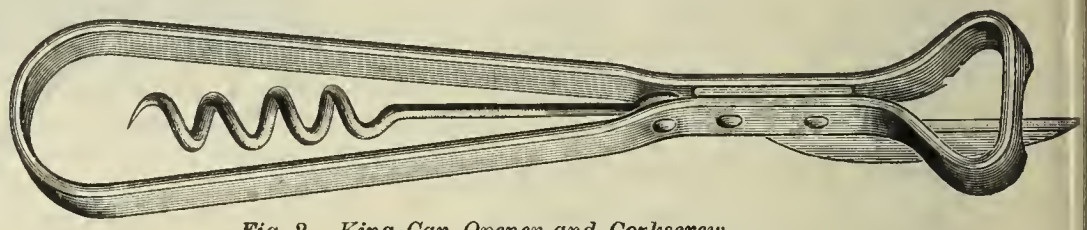

Fig. 2.—King Can Opener and Corkscrew.

Representatlve Childs of Illinois introduced into the House last week a bill to incorporate the Natlonal Central Railway Company, a corporation to be empowered to lay out and equip a rallway from a point on the Hudson River, or from some point in New York City to some point in San Francisco. The project is an immense one, involvlng an outlay of some $400,000,000. A preamble to the bill says that it is declared to be one of the fundamental duties of the Government to provide for common defense and promote the general welfare of its people, and that such defense and welfare can be subserved by connecting the two great centers of population upon the Atlantic and Pacific coasts by the shortest available line for the transportatlon of Government troops, the United States mails, the people and their commerce. The present route can be reduced in distance by 600 or 700 miles.

The ninth annual report of the New York State Factory Inspector, submitted to the Legislature on Monday, recommends, among other things, that eight hours be made the limit of a day's work for women and for children under 16 years of age in factories and mercantile establishments. Legislation is urged regulating the erection of fire escapes on hotels and also for the means of egress and sanitary arrangements in halls, theaters, &c. The report also recommends that inspectors of steam boilers and examiners of stationary engines be appointed with suitable powers.

During the year recently closed, 64 West Australian enterprises, with an aggregate capitalization of $27,600,000, were placed on the London and Scottish markets, the majority during the past three months of the year. Mining and land companies are the main industries for which the support of British capitalists is desired.

HEATING & PLUMBING.

NEW WORK AND CONTRACTS.

THE EXETER MACHINE WORKS, Boston, Mass., have recently shipped five Exeter sectional steam boilers to Chicago for heating five apartment houses owned by Burley & Co.

THE SCHOOL COMMITTEE of Amherst, Mass., will receive bids for heating and ventilating the High School Building. These bids must be based upon the mechanical and gravity systems and must be in the hands of the chairman by Saturday, February 23.

SHAPLEY & WELLS, Binghamton, N. Y., have secured the contract to ventilate the court room, at $1585.

J. G. MAHONEY, Spring Valley, N. Y., has the contract for the tinning and plumbing on the house being erected for Edward Earl.

FRANK E. GODDARD is building a residence at Hartford, Conn., that will have a plumbing system and a hot water heating plant.

DISLEY & WEYAND, Waterbury, Conn., have the contract for the plumbing in three stores and tenements to be erected by H. Zehnder.

WALLER & CAREY are finishing up their contract on E. C. Stoughton's new house in Thomaston, having put in a Winchester heater. The firm have recently moved to 172 East Main street, Waterbury, Conn.

E. A. LETTNEY, Crown street, New Haven, Conn., has taken the plumbing of a house for W. H. Lettney; also a house on Howard avenue, one on Wallace street, West Haven, and the tinning of W. H. Brown's house.

J. VREELAND of Congress avenue, New Haven, Conn., is doing the plumbing in Thos. R. Trowbridge's new double house on Portsea street, besides one on Hurlburt street and one in Allingtown.

THE HEATING APPARATUS in the Hospital for Contagious Diseases, at Detroit, Mich., is to be replaced by a new one.

THE BUILDING COMMITTEE of the Board of Control, Scranton, Pa., awarded the contract for heating and ventilating the new High School to Hunt & Connell for $29,478. The lowest bid was that of Gaylor & Eitapence of Binghamton for $28,937. The disposition to spend the citizens' money at home for the benefit of local workmen influenced the award. The heating system was designed by Fred. P. Smith, the New York heating and ventilating engineer.

M. J. REDMOND & Co., Wallingford, Conn., have been awarded the contract for fitting up the Masonic Home with heating apparatus.

E. W. NOYES of Brockton, Mass., has the plumbing contract for Joseph Pratt's house at Onset.

TWO SCHOOL BUILDING are to be erected at DuBois, Pa., for which the heating contracts have been given to the Peck-Williamson Company, Cincinnati, Ohio.

GEO. J. EGGE, La Crosse, Wis., has received the contract for doing the plumbing in Andrew Hanson's new building.

THE CORTLAND CITY HOSPITAL ASSOCIATION took possession of their property, 86 North Main street, Cortland, N. Y., and will move in as soon as some necessary repairs can be made. Plans will soon be perfected to heat the building by steam.

SEALED PROPOSALS will be received at the office of the Supervising Architect, Washington, D. C., until February 19, for the plumbing of the United States Court House and Post Office Building at New York City. Drawings and specifications may be obtained from the Supervising Architect at Washington, or at the office of the superintendent at New York.

THE FULLER & WARREN COMPANY, 147–149 Lake street, Chicago, are to place two warm air furnaces in the flat building of C. J. Colburn, Lawndale, Ill.

M. L. MANDABLE, 258 Clark street, Chicago, has the contract for the plumbing, gas fitting and sewerage in the residence of Judge Stein, Grand boulevard and Forty-fourth street.

THE JOHN DAVIS COMPANY, 69–79 Michigan street, Chicago, are to install a steam heating plant in the school building at Fulton street and California avenue.

THE CHARLES H. SIMMONS COMPANY, 72 Market street, Chicago, are to install hot water heating plants in the residences of Dr. Jared Bassett and Prof. Robert D. Sheppard, Evanston, Ill.

COOK & CHICK, 253-255 Kinzie street, Chicago, have the contract for steam heating in the two four-story apartment buildings of T. E. O'Brien, Prairie avenue and Forty-seventh street.

THE FULLER & WARREN COMPANY, 147–149 Lake street, Chicago, have contracts for warm air heating in the residences of J. L. Cochran, Edgewater, and John E. Cowles, Hyde Park.

JACOB G. WEBER, 244 North Clark street, Chicago, has the contract for the plumbing, gas fitting and sewerage in the three-story flat buildings of H. Schmedtgen, Elm and Sedgwick streets.

FRANK J. RUH, 1204 Diversey street, Chicago, has contracts for the plumbing, gas fitting and sewerage in the following residences: Dr. Groynee, Halsted street and Evanston avenue; A. Guiner, Jefferson and Huntingdon avenues; T. Meyer, Edgewater.

SEALED PROPOSALS will be received until January 22 for heating and ventilating the Court House at Racine, Wis. Blue prints of the building will be furnished on application. Proposals are to be sent to John Dixon, County Clerk, Racine, Wis.

JOSEPH B. BREEN, 368 West Van Buren street, Chicago, has just finished a bathroom costing $750 in the residence of M. W. Ryan, Throop and Adams streets. He is also doing the plumbing, gas fitting and sewerage in the flat building of A. J. Cronin, Prairie avenue and Forty-fourth street.

M. L. MANDABLE, 258 Clark street, Chicago, is doing the plumbing, gas fitting and sewerage in the ten flat building of Mrs. Vincent, Grand boulevard and Forty-third street.

J. P. ADAMSON, St. Paul, Minn., was awarded the contract for the plumbing in the Dale Street Infirmary.

BAKER, SMITH & Co., New York, have placed an order with the American Radiator Company for 625 radiators of the National pattern, which will be used in the Presbyterian Building at Fifth avenue and Twentieth street, New York, for which they have the heating contract.

THE PEOPLE of Millville, N. J., have inspected the heating plant in their new school and are much pleased with the results of testing it. It was designed by L. W. Gould of Vineland and installed by Alfred Brandriff, using large size Magee Combination heaters.

THE HAMSLEY METAL ROOFING COMPANY, 18 Cliff street, New York, are doing the sheet iron work and setting three large Sturtevant blowers for the exhaust ventilation of a factory in Brooklyn.

HUGH WATT, 339 Dearborn street, Chicago, is remodeling the plumbing in the residence of William Kent, 3616 Grand boulevard.

C. & R. SCHWEITZER, 187 Centre street, Chicago, are remodeling the plumbing in the flat building at 3608 Vernon avenue.

D. D. DEWAR & Co., 335 Sixty-third street, Chicago, have the contract for plumbing, gas fitting and sewerage in the two residences of Joseph Cormack, 680–682 Vernon avenue.

KROESCHELL BROS. COMPANY, 41-59 Erie street, Chicago, have contracts for steam heating in the flat building of J. J. Kane, 195 North Clark street, and residence of F. P. Kenkel, Wilmette, Ill.

METZ BROS., 107 Twenty-second street, Chicago, have the contract for steam heating in the residence of C. H. Platt, 3300 Wabash avenue.

JAMES J. WALSH, 78 Thirty-first street, Chicago, is finishing the plumbing in the eight-flat building of Judge Pendergast, Pearson and Cass streets.

J. HALL, 3723 Cottage Grove avenue, Chicago, is to do the plumbing, gas fitting and sewerage in the two store buildings at 3757–3759 same street.

BARR & CREEDON, Starkey, N. Y., have completed their contract for heating Starkey Seminary by steam, and the work is accepted by the trustees.

LOCK BROS., Williamstown, Mass., have the contract for the plumbing of the new Danforth Block.

THOMAS OAKES, Hartford, Conn., has just closed a contract for 16 Page hot water boilers and 3500 feet of radiators. He is doing the plumbing and gas fitting in a house of six tenements for Robert Allyn and is doing the plumbing, using the goods of the J. L. Mott Iron Works, in the residence of C. C. Beach.

THE BOARD OF EDUCATION for the State of Connecticut will receive proposals for a heating and ventilating apparatus for a Normal Training School Building now being erected in New Haven. These proposals will be according to plans and specifications, to be seen at the office of the Board in Hartford, also at the office of Hartwell and Richardson, architects, 62 Devonshire street, Boston. Proposals must be delivered at the office of the Board in Hartford not later than February 18, 1895.

A report submitted by the Senate Committee on Pacific railroads favors a long time extension of the Union Pacific's debt to the Government, arguing that absolute foreclosure and sale would involve a clear loss of $50,000,000. Federal operation of the road is not regarded as desirable.

STOVE TRADE NOTES.

Cupola Tuyeres.*—IV.

BY DR. EDWARD KIRK.

Bottom Tuyere.

In Fig. 17 is seen the bottom or center blast tuyere. This tuyere, as will be observed, passes up through the bottom of the cupola instead of through the sides, and admits the blast to the center of the cupola at the same level as the side tuyeres. It is not designed to change the nature of the iron by forcing the blast through the molten iron in the bottom of the cupola, and, in fact, the blast has no more effect upon the quality of iron when admitted in this way than when admitted through side tuyeres. A tuyere when placed in the bottom of a cupola, unlike a side tuyere, is brought in direct contact with heated fuel and molten iron, and it must be made of a refractory material or protected by a refractory material if made

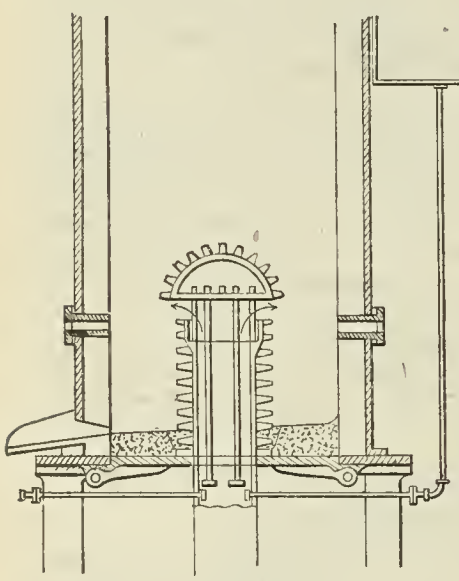

Fig. 17.—Bottom Tuyere.

of metal. The tuyere shown in the cut is made of cast iron and is provided with a water space between the out and in side, through which a stream of water constantly flows when the tuyere is in use from a small pipe connected with a tank placed alongside the cupola or on the scaffold. But it has not been found necessary to keep the tuyere cool with water in short heats, for the heat in a cupola under the tuyeres is not sufficiently intense to melt cast iron, and the tuyere may be sufficiently protected against molten iron dropping upon it or coming in contact with it by a thick daubing of refractory material held in place by the prickers cast on the tuyere. The mouth of a bottom tuyere must be covered to prevent molten iron, slag and fuel dropping into it in its descent to the bottom of the cupola. This is done with a rounded cap placed on top of the tuyere to throw off the molten iron and slag and the blast is admitted to the cupola through an opening around the tuyere under the cap, as indicated by the arrows. The tuyere must be carefully daubed and dried before it is put in place. It cannot be attached to the bottom doors and must be put in place through a hole in the doors after they are put up and withdrawn in the same way and removed before the cupola is dumped to prevent it being broken or injured in falling or by the heat in the dump. It must have an adjustable and removable support and the sand bottom must be made up very carefully around it to prevent leakage of molten iron. The tuyere often gets fast in the bottom and the men are frequently burned in removing it, and it sometimes gets filled with iron or slag and spoils a heat.

The bottom tuyere has been tried a great many times by foundrymen at different periods, and is nothing new. In conversing with several old foundrymen in Massachusetts about 17 years ago I learned that the bottom tuyere had been used in that State away back in the '40's, and at one time was quite popular with foundrymen there; and I have met a number of other old foundrymen in different sections of the country who had tried the tuyere years ago and given it up. A bottom tuyere was patented by B. H. Hibler in this country August 13, 1867. Ireland & Voisin used a bottom tuyere in their cupolas many years ago, and had these practical men found any advantages in it over the side tuyere it would, no doubt, have been brought into general use in cupolas before this.

The bottom tuyere was brought prominently before the foundrymen of this country by an ably written article by Thomas D. West, read before the Western Foundrymen's Association at Chicago, Ill., October 18, 1893, in which he describes his experiments with the tuyere and claims for it a great saving in fuel and cupola lining. Since the publication of Mr. West's article a number of foundrymen have published their experience with the tuyere and all claim it effects a great saving in lining and fuel. But if these foundrymen have not discovered some new feature in the tuyere that was overlooked by experimenters with it years ago, it will never come into general use.

Size of Tuyeres.

Foundrymen make a great mistake in placing small tuyeres in their cupolas, with a view of putting the blast into the cupola with greater force and driving it to the center of the cupola with the blower. Air may be driven from a small opening by a blower with greater velocity than the same volume of air from a large opening, but the air from a small opening loses its velocity when it strikes a solid body, just the same as the air from a large opening. When the blast from a small tuyere strikes the solid fuel in front of a tuyere its velocity is gone and it will not penetrate any further into the stock than the same volume of blast from a large tuyere. It is not the velocity at which the blast passes into a cupola that drives it to the center, but the force behind the blast. Neither is it the velocity of the blast that does the melting. It is the volume of blast. It therefore follows that nothing is gained in melting by forcing the blast through a small tuyere into a cupola with great velocity, and much is lost by increasing the power required to run the blower to force the blast through a small tuyere.

The small tuyere was one of the greatest mistakes made in the old-fashioned stave cupola. In these cupolas, many of which I have seen, only two tuyeres of 3 or 4 inches diameter were placed in a 30-inch cupola and the improvement made in melting in the modern cupola is largely due to the enlargement of the tuyeres and the free admission of blast to the cupola.

The combined tuyere area of a cupola should be equal to three times the area of the outlet of the blower when the blower is of a proper size for the cupola. These dimensions may seem large at first sight, but it must be remembered that the size or area of a tuyere when a cupola is not in blast does not represent the area of the tuyere when the cupola is in blast or the volume of blast that may be admitted to the cupola by the tuyere. When a cupola is in blast the space in front of the tuyere is filled with fuel weighted down by tons of iron. This fuel closes the mouth of the tuyere and the outlet is represented by the number of crevices between the pieces of fuel through which the blast may escape. Should a large piece of fuel fall in front of a tuyere the blast cannot remove it and the tuyere may be closed and rendered useless. Small tuyeres are more liable to be closed in this way than large ones, and for this reason small tuyeres should never be placed in a cupola. Small tuyeres, furthermore, are not only more liable to be stopped off by the fuel but also tend to promote bridging by admitting an insufficient amount of blast at certain points.

* Copyrighted, 1894, by Edward Kirk.

The A. J. Lindemann & Hoverson Company

of Milwaukee, Wis., have extended their line of gasoline stoves for the coming season. They manufacture Anchor juniors of one, two and three burners; Anchor high juniors, with two and three burners; Anchor step juniors, with two and three burners on top and a double burner in the step; Star juniors, with one, two and three burners; Star high juniors, with two and three burners; Star step juniors, with two and three burners in top and a double burner in the step; Anchor individual burner stoves, with two and three burners in top and one double burner in the step; Anchor single generator stoves, with two and three burners in top and one double burner in the step. They also manufacture the L. & H. process line, which consists of the L. & H. process cabinet with two top cooking holes, two top holes and step, or three top holes and step; also open frame two and three burner stoves without the step. The cabinet stove is a very pretty construction, with a large high shelf, full sized oven and a burner constructed on a wholly new plan. The individual burner and generator stoves are supplied throughout with the

L. & H. removable safety tank and with double valve burners in all but the cheapest grades. The generator is started without smoke or odor or a flashing fire, all of which is avoided by the use of a small quantity of alcohol to heat the burner, an alcohol receptacle being arranged in a convenient place. In addition to gasoline stoves the company manufacture the L. & H. gas ranges in four styles, small gas stoves and lamp stoves. On all lever valves the words "open" and "closed" are placed, to positively catch the eye of the operator. Further additions to their line of stoves are contemplated by this enterprising company.

The Clark Stove Company.

According to Kansas City papers the recently incorporated Clark Stove Company will be operating a considerable plant for the manufacture of steel ranges by April 1. A plot 150 x 300 feet in dimensions alongside the plant of the Armourdale Foundry Company, southeast corner Kansas avenue and Adams street, Armourdale, will be occupied by the buildings of the new factory. Ground will be broken at once for three brick structures—a foundry 55 x 128 feet, a two-story mounting room 55 x 60 feet and a two-story storage and office building also 55 x 60 feet. The capacity of the plant will be 40 steel ranges per day.

The new enterprise is incorporated by R. M. Clark, A. M. Clark, O. A. Clark, R. A. Clark and H. N. B. Umbach, with $100,000 capital, of which $50,000 is paid in. R. M. Clark is president and H. N. B. Umbach is secretary and treasurer. The Kansas City office and store is at 704 Main street. Fifty thousand dollars in 7 per cent. interest bearing preferred stock will be sold. The buildings will cost $20,000. The new and original machinery will represent at least a like sum.

R. M. Clark, the originator of the enterprise, is from Madison, Wis., and latterly from McPherson, Kan., where he conducted a large stove business. He is a well-known mechanic and is the inventor of the three-wheel plow which is now universally used. After several years of inventive labor he has perfected the Clark steel range, which, it is stated, may be used with coal or gasoline. It has been made by contract in Kansas City for some little time, and the success of its sale has interested Robert Gillham and Gus P. Marty, proprietors of the Armourdale Foundry, in its manufacture and promotion on a large scale. They are so sure of the worth of the invention, and have such faith in Kansas City as a good point for manufacture and distribution, that they have contracted to erect the necessary buildings upon their ground and accept a rental from the stove company. The facilities of the plant will be modern in every respect. The machinery includes labor saving devices which will greatly cheapen the production.

HOWARD M. CARY, Boston agent for Sam S. Utter, died January 28, aged 58 years. Mr. Cary was well known throughout the New England trade as a man of sterling business integrity and enjoyed the respect of a wide circle of friends. We understand that the Boston agency will for the present be discontinued and that it is the wish of Mr. Utter that dealers forward their orders direct to 113 Beekman street, New York City.

ODD PLATES.

THE CLEVELAND FOUNDRY COMPANY of Cleveland, Ohio, and with branches in Boston, New York, Chicago and San Francisco, have just issued an attractive catalogue of 68 pages, relating to their leading specialties. Within the paper covers of the publication are found illustrations of many new goods not contained in last year's edition. The company announce that they are preparing still other lines of goods, both for oil and for gas, circulars relating to which will be distributed from time to time as the productions are ready for the market. In their announcement to the trade they refer to the fire on October 10 of last year which destroyed the greater portion of their works, and while this was a serious loss, the reconstruction has given the company the opportunity to enlarge and rearrange the buildings in such a way as to greatly increase their facilities and enable them to handle orders more promptly than ever before. The catalogue before us is taken up with illustrations of the Puritan oil and gas heating and cooking stoves, which are offered in great variety, and which embody in their construction features which have established for them a gratifying reputation. Attention is given to ovens, broilers, registers, ventilators, sad irons, floor borders, &c, as well as gas radiators, drums, &c. The catalogue is neatly printed and is bound in attractive paper covers.

WHITE, WARNER & Co., Taunton, Mass., manufacturers of the well-known Household lines of ranges and stoves, are sending to their customers a very handsome piece of cardboard standing 15 inches high and representing a lyre, the frame of which is decorated with 12 variously colored roses of different varieties. Behind each of these is a calendar, there being one for each month in the year. The calendar is arranged to either hang or stand.

THE BUSSEY & MCLEOD STOVE COMPANY of Troy, N. Y., resumed operations at their plant January 24. They now employ a force consisting of 150 men. It is their intention to increase the number in the near future.

THE STOVE MOLDERS of Albany, N. Y., have been uneasy for some time past and have held several meetings to discuss the situation. They are complaining of the long shut down of stove foundries in that city, and that with no work they are still obliged to pay their dues to their national organization. Committees were appointed to wait upon the management of one or two of the stove foundries and present the grievances concerning the extended idleness. As the foundries are resuming as rapidly as the condition of business affairs warrants, no trouble is anticipated, and everything will probably be amicably arranged by the employment of the old forces of molders.

C. B. SMYTHE AND W. F. HABICHT, representing F. M. Borden & Bro., Philadelphia, are visiting the trade in the interests of gasoline and gas stoves and refrigerators, and are sending in with their orders for immediate shipment long lists of stove repairs, of which the house make a specialty. They are also showing photographs of the Novelty and Leaf lines of stoves and ranges.

AT THEIR ANNUAL MEETING, recently held in St. Louis, the Buck's Stove & Range Company elected the following officers: F. F. Palms, president; G. H. Barbour, vice-president; J. W. Van Cleave, treasurer and general manager; H. C. Thompson, secretary; F. F. Palms, G. H. Barbour, J. W. Van Cleave, Jeremiah Dwyer and F. W. Gardner, directors.

THE RINGEN STOVE COMPANY, 414 North Broadway, St. Louis, Mo., favor us with a copy of their 1895 catalogue relating to Quick Meal gasoline stoves. It is made up of 30 pages, printed in blue-black ink on a good quality of paper and bound in the same style of paper covers which has characterized the annual publications of this company for several years past. The opening pages are devoted to a new line of Quick Meal ranges of the evaporating style and embodying the latest improvements. Numerous varieties are shown running from the two-burner construction designed for the use of a small family up to the three-burner and step range having oven, warming closet and steel base, adapted for hotel and restaurant use. One of the varieties of this stove is shown in the catalogue in connection with a canopy. Other pages are given up to Quick Meal ovens, saucepans, plumbers' furnaces, paint burners, torches, waffle irons, cans, burners, &c. One of the leading features is a page showing the Quick Meal tank for 1895, and the construction of the Quick Meal balance door.

THE TOLEDO STOVE WORKS, located at Auburndale, Ohio, were recently damaged to a slight extent by a fire which originated in the molding room. The loss was fully covered by insurance.

THE GREAT WESTERN STOVE & MFG. COMPANY of Leavenworth, Kan., expected at the date of latest advices to resume operations on Friday, February 1, with a full force.

THE STANDARD LIGHTING COMPANY of Cleveland, Ohio, have found it necessary to enlarge their manufacturing facilities in order to handle their rapidly increasing business. They have just awarded contracts for an addition to their present plant which will give a frontage of 400 feet and a depth of 150 feet, the building being three stories high. This new space will be largely devoted to the manufacture of gas stoves and when the improvements are completed the company state they will have the largest gasoline and gas stove factory in the world.

THE BELLEVILLE STOVE COMPANY of Belleville, Ill., have recently elected the following Board of Directors: Charles Becker, Joseph Fuess, George A. Rebham, Frederick Sattler and J. J. Weingaertner.

THE MOLDING DEPARTMENT of the Weir Stove Company, Taunton, Mass., resumed operations on Wednesday, January 23, and the other departments resumed on the day following.

AT A RECENT MEETING of the stockholders of the Western Stove Mfg. Company of St. Louis, Mo., the following directors were elected: Joseph T. Dugdale, Lucas Edel, J. H. Woltering, B. H. Sanders, H. F. Lucey, Antone Werbich, George Reiners, Wm. T. Dugdale and John M. Schurman. At a subsequent meeting of the Board of Directors Joseph T. Dugdale was elected president and Lucas Edel secretary and treasurer.

F. M. BORDEN & BRO., Philadelphia, Pa., are sending out three new gasoline stove catalogues. One is in a mottled

blue cover, with the title embossed in gilt, and is devoted to the New Process vapor stoves. The text is in two colors on fine paper, with half tone engravings of the various styles of the New Process stoves in cabinet, semi cabinet and steel frame finish. The Reflex oven is shown as a specialty, one view representing it "knocked down" for shipping, when it occupies but little space. Sectional views are given of the valve and of the burner drum. The remaining pages are devoted to cooking utensils and instructions, with cuts for ordering repairs. Another catalogue is in a buff cover, devoted to the Splendid Novelty generating vapor stove, the text being grinted in a dark green ink. Cuts show the stove in several forms, and several pages are occupied with sad iron heaters, toasters, broilers, ovens and cooking utensils. The Globe Junior gasoline stoves are shown in a catalogue printed in blue, and nothing is omitted in the text or pictures to bring the attractions of this line before the trade. Prospective purchasers will find these catalogues an aid in selecting their line of gasoline goods. Attention is also called to the company's line of coal cooks, gas stoves and refrigerators.

GEORGE M. CLARK & Co., with office and factory at 149–161 Superior street, Chicago, Ill., issue an attractive catalogue of Jewel gasoline stoves for the season of 1895. In general shape and size the publication corresponds with those issued in previous years by this enterprising concern, and dealers will find within its attractive paper covers much to interest them. In their greeting to the trade the company refer to the thousands of dealers who have handled Jewel gasoline stoves, and state that 13 years of stove manufacture means with them the ability to furnish repairs for stoves made 13 years ago. Among the new features and improvements incorporated in the process stoves for 1895 are: A new shield that is removable; a clean out slide at the base of the central draft tubes; a lug at each valve outlet in the tank; a wide base bar for all burners; a removable strainer wire, with handle, at the fuel funnel; the tank finished in antique bronze, while the stoves themselves are finished in copper plate decorations instead of nickel plate. The single generator stoves have new high shelves above the top, and there has been added a new 26-inch high stove of the same capacity as the two-burner step stove. In connection with individual burner stoves it is stated that the Jewel-Acmes are fitted with a burner that may be turned low without the complication of two needles, and that the Jewel Junior Safety, 24 and 14 inches high, with Jewel burner and cut off, are supplied at the same price as the Jewel-Acme stoves of last year. In the way of stove furniture the company have added new oven racks that run sidewise, instead of up and down, and are properly adjusted to hold two layers of bread. The catalogue is profusely illustrated and shows in detail the important parts of the Jewel process stove. In connection with the letterpress there are given the various sizes in which the different stoves are made, together with their prices. Remarks about repairs, an index which gives weights, crate charges, prices and telegraphic code words of Jewel gasoline stoves are some of the other features of the publication.

THE CULTER & PROCTOR STOVE COMPANY of Peoria, Ill., are distributing an illustrated circular showing the new pattern of their Peoria Lexington six-hole range intended for using coal or wood as a fuel. The design of this stove is exceedingly attractive, and the finish is of a high order of merit. It embodies the latest features of convenience and utility, and is referred to by the manufacturers as a rapid seller. The company are offering the trade 59 styles and sizes of Peoria-Lexington cook stoves and ranges.

"THE EVANS PURE AIR FURNACE" is the title of a 30 page pamphlet of convenient size, which reaches us from Charles A. Evans, proprietor of the Evans Furnace Works, Thirteenth street, above Buttonwood, Philadelphia, Pa. The heater named is described at considerable length, while illustrations show the general appearance of the apparatus as well as the internal arrangement of parts. The little pamphlet tells what the furnace does and how it does it in a way to interest the trade. Nearly one half of the pages are taken up with testimonial letters from some of those who have used the Evans heaters.

THE TROY NICKEL WORKS, Troy, N. Y., ask us to inform the trade that their crop of dimeand pins has run out for 1895 and that those who have been so unfortunate as not to get one will be remembered in their next.

THE ELLWOOD GAS STOVE & STAMPING COMPANY of Ellwood City, Pa., favor us with copies of two attractive pamphlets which they have issued relating to their specialties for the season of 1895. The larger of the two publications consists of 16 pages neatly printed, profusely illustrated and bound in attractive paper covers. Special attention is directed to the company's line of single generators which are furnished with the Ellwood safety tank, as well as the low-down tank. The Ellwood junior gasoline stoves are constructed with tops, legs and bands of stamped steel while the bodies are japanned and neatly ornamented. They are fitted with the company's No. 2 individual burners which are operated with nickel wheel blunt valve, so that the flames can be turned low without being extinguished. The needle valve is the special feature of the burner, and is easily operated with one-quarter turn. The second pamphlet relates to the Ellwood gas heaters and radiators which are shown in extensive variety. Brief, descriptive particulars are presented in connection with each illustration and the general arrangement is such as to interest the trade.

THE MANY FRIENDS of D. M. Thomas, secretary of the National Association of Stove Manufacturers, will regret to learn of his continued serious illness. The improvement noted in his condition in our issue for December 29 was of short duration, and he was unable to carry out the recommendations of his physicians regarding a trip to Bermuda.

A NEW TRIAL was granted by the Michigan Supreme Court on January 22 of the condemnation suit of the Fort Strect Union Depot Company against the Peninsular Stove Company of Detroit. The trial of this case occupied about two months' time of the Wayne Circuit Court and resulted in a verdict in favor of the stove company for $49,500. This amount represented the damages which the stove company would receive by the construction of the viaduct along River street, adjacent to the stove factory. It was contended that the passing of the locomotives and cars by the side of the stove works would jar the molds and cause great and irreparable damage to the company.

THE ABRAM COX STOVE COMPANY and the Model Heating Company have removed to 52 Dearborn street, Chicago, where they occupy a fine suite of rooms on the second floor. The building has just been rebuilt and modernized throughout, having all conveniences of a first-class office building, including elevator service. The rooms occupied comprise, first, a large sample room and general business office; second, a furnace room, in which furnace parts are shown so as to thoroughly explain the warm air apparatus; next, a special office for the manager, in which steam and hot water boilers are shown in sections, so that their construction can be explained; and last, a private room for drafting, or special work. Thus the new quarters provide much more room and far greater facilities for the dispatch of business than prevlously possessed. A further advantage is gained in the closer proximity to the center of the steam, hot water and furnace district. The warehouse will from necessity be separated from the offices, but will not be far away. The local management of these companies continues in the hands of Edward P. Mott, under whose able supervision their Western trade has steadily expanded. They do no contract work whatever, but furnish office room to John J. Shear and John M. Hansen, engineers and contractors for hot water and steam heating, and to Harcourt Mott, who installs warm air furnaces.

THE PENINSULAR STOVE COMPANY of Detroit and Chicago are showing remarkable enterprise for the times. In the first place, they are bringing out a new full line of steel ranges. They have done so well in this branch of trade that their success has stimulated them to greater exertions. Theirsteel range plant has been so thoroughly equipped that the claim is now made that it is among the foremost in the country. The company are also bringing out a four-hole medium priced wood range, to be named Bronze Peninsular; a six hole medium priced wood range, to be named Silver Peninsular; a complete line of six-hole first-class coal ranges, to be named Domestic Peninsular; a line of four-hole medium priced coal ranges, to be named Onyx Peninsular and a line of six-hole medium priced coal ranges, to be named Granite Peninsular. Some addition is also to be made to the line of Welcome Peninsular wood cooks. Manager Edward C. Hanrahan of the Chicago branch, at 79 Wabash avenue, expresses much confidence that the company's enterprise will be appreciated by the trade.

THE J. L. MOTT IRON WORKS, Beekman and Cliff streets, New York, are putting on the market a new range in one size, 7-inch, which is called the Claremont. It is made with right or left oven 11 x 16 x 17 inches in size and is furnished with low closet and water back. The top is of the French style and the range presents several interesting constructive features.

ALBERT N. PARLIN, treasurer of the Magee Furnace Company, visited John M. Sweeny at the New York house at 242 Water street last Tuesday previous to sailing on the "Fuerst Bismarck" for a visit to the Mediterranean and the Orient. He will stop at some of the large European cities on his return, reaching home in April.

THE THATCHER FURNACE COMPANY, 240 Water street, New York, are run-

ning their foundry on full time on the Thatcher furnaces and ranges and Champion steam and hot water heaters. They have recently completed a new cupola of double the capacity of the one formerly used. The cupola is located in a new brick building that is provided with a steam elevator for lifting the coal and iron. The company state that their goods have given general satisfaction and their trade is increasing.

AN UNINTENTIONAL ERROR was made last week in stating that the Cole Mfg. Company had incorporated at Omaha, Neb. This is not the case, The Cole Mfg. Company are incorporated, with a capital stock of $100,000, in the city of Council Bluffs, Iowa, under the laws of the State of Iowa and not Nebraska, and they are doing business in the city of Council Bluffs, Iowa, manufacturing Cole's air tight wood heater and tank heater, and jobbing bicycles and stoves.

THE PERRY STOVE COMPANY, 242 Water street, New York, are showing a line of Argand high junior gasoline stoves. One of the features is a step burner that may be folded against the frame when not in use.

The Western Stove & Mfg. Company,

60 to 70 Third street, Milwaukee, Wis., report an excellent start in trade for a new company, having sold a large number of stoves for delivery the coming season. They have a well equipped factory, in which they have placed the most approved machinery under the direction of experts in this line. Special care is taken in the construction of stove parts. The needle valves are made with great exactness, and all burners are bored from the solid instead of being cored castings, thus avoiding the possibility of sand holes. All parts of the frames, including tops and bottoms, are made in this factory. The frames are made exceptionally strong, while the tops are considerably wider than usual, so as to provide plenty of room to hold cooking utensils. The mounting and finishing shop occupies a separate story of the building. Here all stoves are tested for an hour before being sent out or stored. The same method is pursued even with the cheapest grades. The company make a special cap for their burner which intensifies the flame, as shown by tests made with this and ordinary burners. The output of the works is gradually increasing, and in a short time the company hope to be turning out 200 stoves daily. They have recently appointed Reeves & Smiley, 44 North Fourth street, Philadelphia, their sales agents for Western Pennsylvania, Western and Southern New Jersey, Delaware and Maryland.

The British *Naval and Military Record* reports that as a result of a series of experiments recently carried out by the Ordnance Committee at Portsmouth, the Admiralty have decided to introduce into the British navy a new type of shell for use with all breech loading guns, from the 16½-inch 110-ton down to the 6-inch 5-ton gun, and also for the 6-inch quick firing gun. The new projectile will be made of cast steel and will have a pointed head. Hitherto the bursting charge of the common shell used for all the larger types of breech loading and quick firing guns has received its detonation by means of a fuse fitted into the head of the projectile. This arrangement seriously interfered with the penetrative power of the shell, and it is principally for the purpose of giving greater facilities for penetration that the pointed heads are to be adopted. The base of the projectile, which has hitherto been used exclusively for filling with the bursting charge, will now also be arranged for the reception of a fuse. The projectile for the 16.25-inch gun will, when empty, weigh over 1600 pounds, and will be made to receive a bursting charge of about 200 pounds of gunpowder.

Trade Notes.

THE STOWE MFG. COMPANY, Binghamton, N. Y., issue their No. 5 Catalogue of the Stowe Flexible Shaft, of which they are the inventors and manufacturers. The first page of the catalogue proper presents a portrait of N. Stowe, the president of the company. The shaft is illustrated in all its various forms and a description of its advantages is presented. It has a very extensive application, as shown by the illustrations in the catalogue. All the attachments and appliances connected with the shaft are likewise noted.

MCCLURE & Co., 62 Second avenue, Pittsburgh, Pa., in an announcement refer to their guaranteed brands of roofing tin which include McClure's Redipped, McClure's Hand Coated and O B T Extra Coated.

THE KIECKHEFER BROTHERS COMPANY of Milwaukee, Wis., deny the report that they are about to engage in the manufacture of Enameled Ware. It had been stated that they proposed to equip a large factory for this special purpose.

THE JOSEPH DIXON CRUCIBLE COMPANY, Jersey City, N. J., continue their practice of sending out serviceable monthly blotters to the trade. The one for February is appropriately decorated with a medallion of President Washington.

HAMILTON'S BEST REDIPPED AMERICAN ROOFING TIN is the subject of an advertisement elsewhere of John Hamilton, 62–64 Third avenue, Pittsburgh, Pa. The merits of the plate are referred to in the announcement.

Crop figures for last year, published by the Government, indicate that, as compared with 1893, there was an increase of 64,000,000 bushels of wheat and 23,000,000 bushels of oats, but a decrease of 400,000,000 bushels of corn. The latter crop was the lowest recorded for many years. The farm value of the nine most important crops, exclusive of cotton, is broadly estimated at $1,621,000,000, the figures, as compared with earlier years, being given as follows:

Crops.	1894.	1890.	1880.
Corn	$554,700,000	$754,400,000	$699,700,000
Hay	458,500,000	408,400,000	371,800,000
Wheat	225,900,000	334,700,000	474,200,000
Oats	214,860,000	222,000,000	150,200,000
Potatoes	91,500,000	81,400,000	81,000,000
Tobacco	27,700,000	43,600,000	43,300,000
Barley	27,100,000	37,600,000	30,000,000
Rye	13,300,000	16,700,000	18,500,000
Buckwheat	7,000,000	7,600,000	8,600,000

President Ingalls of the Chesapeake & Ohio Railroad announces that after April 1 next that road will relinquish the coal agency business which it has maintained for many years. This decision has given much satisfaction to the Virginia coal operators.

TRADE REPORT.

The Iron Market.

Pig Iron.—There has been no important improvement during the week in the New York market. Special Bessemer is offering at low figures from the West, $14 @ $14.50 being named, according to place of delivery. We quote $12 @ $12.50 for No. 1; $11 @ $12 for No. 2, and $10.50 @ $11 for No. 2 Plain, standard brands, tidewater delivery. Southern Iron, same delivery, is selling at $11.25 @ $11.50 for No. 1; $10.25 @ $11 for No. 2; $10 @ $10.50 for No. 3; $10.25 @ $10.75 for No. 2 Soft, and $10.50 @ $10.75 for No. 1 Soft. Foundry No. 4 (Foundry Forge) is $9.50 @ $10.

Philadelphia advices indicate that the condition of the market in that district is little changed. At the reduced prices the market is steady, and, while the demand is not large, furnaces appear to keep pretty clear from accumulations. Consumers are stolidly indifferent, however, and take nothing but what they just happen to want, no matter how low the price may be. Sellers understand the situation, and are, therefore, not forcing the market, seeing that it would not increase the volume of business, although it might affect prices, which as a matter of fact are as low as they can be made without going under actual cost. The following quotations fairly represent the market for Philadelphia deliveries, Harrisburg, York and Baltimore being 20¢ to 30¢ less, according to proximity of furnace:

Standard No. 1 Foundry X	$12.00 to $12.50
Standard No. 2 Foundry X	11.00 to 11.50
No. 2 Plain	10.75 to 11.00
No. 1 Soft	11.50 to 11.75
No. 2 Soft	10.75 to 11.00

The most important feature of the Chicago Pig Iron market has been the steady increase in shipments of local Iron. Foundries are resuming work very generally and are ordering their Iron to be more promptly shipped on contracts closed some time since. The movement is heavy and fully up to that of 18 months back. New business, however, is disappointingly slow; buyers make inquiries and then postpone purchases. A tendency is developing to stiffen prices of Southern Iron on account of the restricted number of concerns now producing. Lake Superior Charcoal is still quiet. Quotations are as follows, for cash:

Lake Superior Charcoal	$13.00 to $14.00
Local Coke Foundry, No. 1	10.25 to 10.50
Local Coke Foundry, No. 2	9.75 to 10.00
Local Coke Foundry, No. 3	9.50 to 9.75
Local Scotch	10.50 to 11.00
Ohio Strong Softeners, No. 1	12.50 to 13.00
Southern Silvery, No. 1	11.50 to 11.75
Southern Silvery, No. 2	11.25 to 11.50
Southern Coke, No. 2	10.00 to 10.50
Southern Coke, No. 3	9.75 to 10.25
Southern, No. 1, Soft	10.25 to 10.50
Southern, No. 2, Soft	9.75 to 10.25
Alabama Car Wheel	17.50 to 18.00
Jackson County Silvery	15.50 to 16.00
Other Ohio Silvery	14.25 to 14.50

Foundry Iron in the Pittsburgh district has not shown any improvement during the week, either in demand or prices, and No. 2 Foundry has sold at the lowest prices ever known. Quotations are given as follows, for cash:

No. 1 Foundry	$10.50 to $10.65
No. 2 Foundry	9.75 to 10.00

Our Cincinnati representative reports that in that market there have been several large sales of 2000 and 3000 ton lots, as well as several sales of 500 to 1000 tons, and, too, there have been a number of small orders aggregating quite a considerable amount. Deliveries extend from one to four months, but one particularly noticeable feature is that the demand is mainly for prompt or early delivery. From a review of the situation it is evident that buyers are purchasing only for current wants. There is no disposition to speculate even to the extent of anticipating probable needs. On the whole melters of Iron seem to be carrying very light stock. Stove foundries, Pipe works, rolling mills and general foundries have figured in the ranks of buyers. The number of small orders received seem to indicate more general animation, although there are other features to discourage this belief. At the moment buyers seem to be having the best of the market, but the market is so sensitive that any concerted or prolonged buying movement would cause quick response and a stronger feeling, if not higher prices. Quotations are given as follows:

Southern Coke, No. 1	$9.75 to $10.00
Southern Coke, No. 2	9.00 to 9.25
Southern Coke, No. 3	8.50 to 8.75
Ohio Soft Stone Coal, No. 1	14.50 to 15.00
Ohio Soft Stone Coal, No. 2	14.00 to 14.50
Lake Superior Coke, No. 1	11.75 to 12.25
Lake Superior Coke, No. 2	10.75 to 11.50
Hanging Rock Charcoal, No. 1	16.00 to 16.50
Hanging Rock Charcoal, No. 2	15.50 to 16.00

Lake Superior Car Wheel and Malleable	14.25 to 14.75

The Pig Iron market in St. Louis is characterized by extreme dullness. Occasionally an order is secured but in most cases the amounts do not average much over 100 to 200 ton lots, for immediate shipment. Prices are firm and are being maintained, as the past month has demonstrated very effectually that sales cannot be increased by shading prices. Nearly all the heavy local consumers of Pig Iron are now running full time and it is expected that they will shortly be in the market, as none of them are carrying very large stocks. No. 2 Foundry continues to be firmly held on the basis of $7, f.o.b. cars Birmingham. We quote as follows for cash, f.o.b. cars St. Louis:

Southern Coke, No. 1 Foundry	$10.25 to $10.50
Southern Coke, No. 2 Foundry	9.75 to 10.00
Southern Coke, No. 3 Foundry	9.25 to 9.50
Southern Car Wheel	16.25 to 16.75

H. O. Canfield, Bridgeport, Conn., issues a catalogue relating to Mechanical Rubber Goods. A specialty is made of Plumbers' Rubber Supplies, and illustrations are given in the catalogue of Basin and Bathtub Plugs, Bibb Washers, Bumpers or Fender Tips, Floor Plate Flange Rings, Glass Gauge and Plunger Rings, Basin and Tub Waste Washers, Solid Valve Disks, Beer Pump Rubber Supplies, Car and Carriage Springs. Pump and Ball Cock Valves, Rubber Pipe Unions, &c. The manufacturer refers to the catalogue as much more complete than any he has heretofore issued.

Metal Market.

Pig Tin.—The lively skirmishing to secure Tin for January delivery, which marked the close of last week and forced the wholesale price up up 15¢, came to an end at the beginning of the present week. With the closing out of the January deal the market gradually assumed more normal shape, as far at least as the relative prices are concerned. The sharp fluctuations that have taken place during the past 30 days, chiefly through purely speculative contest, leave sentiment feverish in the extreme. Operations are, therefore, conducted with caution, since it remains to be seen which of the contending factions will come out best in the long run. The movement of wholesale prices this week has again been downward, and the market closes in an unsettled condition. Jobbing business has been moderate and prices during the week irregular. Quotations for small lots at the close, however, ruling at about the same figures as were given last week, namely, 15¢ ℔ lb.

Copper.—The market is wholly unchanged. Merely routine business has been done, the volume of which does not appear to have been more than fair, and neither export nor home trade demand has exceeded commonplace proportions. Still no considerable amount of copper comes out from any quarter, and prices for all descriptions are kept remarkably steady. It is claimed that deliveries the past month have been on a level with the output of the mines, and that the market has substantial basis of strength on the statistical position alone. So far as the retail trade is concerned, consumers are still inclined to adhere to a conservative policy in buying. Small lots of Lake Ingot from store are quoted at 10½¢ ℔ lb.

Sheet Copper.—The demand is only moderate and inquiry hardly up to the average of last week. Small jobbing quantities are sold on a basis of 15¢ ℔ lb, net, with a reduction in the case of larger lots, or where special inducements prevail.

Pig Lead.—Compared with that of a week ago the present condition of the market shows hardly any change. Sellers are not offering with greater freedom nor yielding anything on prices. Buyers adhere to a very conservative policy, purchasing only as well defined wants may dictate. The market generally is quiet, but steady, small lots of American Pig ruling at 3½¢ @ 3⅝¢ ℔ lb.

Lead Pipe and Sheet.—Dealers report a narrow demand, governed almost exclusively by actual present needs. There seems hardly the least disposition to anticipate wants, and these are very moderate at the present time, owing to the prevailing slackness in the building trades. Prices are moderately firm, according to list, in this section.

Spelter.—There has been no improvement in business or in the demand, but offerings have become more urgent, causing prices to soften. Good brands

of Western may be secured in small lots at 4¢ @ 4¼¢ ℔ lb.

Antimony.—The market is steady, with a moderate demand. Prices unchanged from last week's quotations.

Nickel.—Quotations remain at about 36¢ @ 42¢, according to quantity of metal involved.

Tin Plates.—In Coke Plates for forward shipment quite a good business has been done during the earlier part of the week, but the buying interest has moderated and the market has relapsed into a condition of extreme dullness, notwithstanding the fact that prices have been marked down to the lowest known. Spot business haa been irregular, and in the aggregate smaller than that of last week. Nothing indicates any immediate improvement in this respect, consumers appearing determined to maintain their hand to-mouth policy in buying, uninfluenced to any appreciable extent by the inducements offered by low prices, Some sales are reported as having been made during the week at exceptionally low prices. A quantity of stock that has been warehoused since before the imposition of the McKinley tariff has recently been auctioned in New York and Philadelphia, fetching phenomenally low prices —in some instances from 50 to 60 % below the market value of the Plates at the time they were imported, although they are said to be in excellent condition. The closing down of a number of Welsh works has been followed by the starting up of several large domestic plants under the new compromise wage scale, so that no scarcity of Plates is apprehended.

The following London cable dispatch of January 30 to *The Iron Age* describes the British Tin Plate Market:

The Tin Plate market has been slow and prices are still easier. Business limited mostly to very small lots, some of which were at below previous bottom rates. Quotations f.o.b. Wales are given as follows:

Bessemer Cokes, IC 14 x 20	....	@	9/3
Siemens Cokes, IC 14 x 20	....	@	9/6
Ternes, 20 x 28	18/	@	23/
Charcoals, IC 14 x 20	10/6	@	13/

Sheet Iron.—Manufacturers' agents report a very fair business, sufficient to keep the mills supplying this section actively employed. An increasing disposition is noted among consumers to anticipate their requirements, and some good sized orders are being placed for future deliveries. The demand for Black Plates for tinning purposes is referred to as excellent, due to the starting up again of a number of Tin Plate worka who buy their plates. Galvanized Sheets are rather quieter. Jobbers' quotations for small lots of No. 27 Common Iron from store are about 2.65¢; and Galvanized rules at 75 and 5 % @ 75 and 10 % off.

THE ELECTRIC HEAT ALARM COMPANY, 145 High street, Boston, Mass., issue what they entitle their descriptive Catalogue No. 4 of Automatic Fire Alarms, Automatic Journal Bearing Alarms, Hotel Call and Fire Alarm System, Automatic Alarms for Grain Elevators, Coal Bunkers, Warehouses, &c. The catalogue is a neat pamphlet of some 50 pages, bound in red cloth, and gives a full description with illustrations of the various alarms alluded to. With the increasing use of electricity for the purposes indicated alarms of all sorts are becoming generally introduced, and the instruction and diagrams given in this pamphlet will be appreciated by all who have to do such work. At the end of the catalogue are a number of testimonial letters from those who are using the alarms and are willing to speak of their merits.

Chicago Report.

Scrap.—Cheap scrap is moving quite freely, but high grade scrap is very dull. Dealers quote their buying prices as follows, Chicago delivery:

	Per net ton.	Per ℔
No. 1 Wrought Scrap	$6.50	....
Machinery Cast	5.50	....
Malleable Cast	5.00	....
Stove Plate (free of burnt)	4.00	....

Sheet Iron and Hoops	2.00	....
Plow Steel and Breaking Stock	4.00	....
No. 2, such as Shovels, Hoes, &c	3.00	....
Old Boilers—whole (Iron)	3.00	....
" (Iron)—cut in single Sheets and Rings	5.00	....
Old Gas-Pipe and Boiler Tubes	5.00	....
Cast Borings	3.00	....
Turnings	4.00	....
Horseshoes	7.50	....
Copper Bottoms	....	6 ¢
Copper Clips and Heavy	....	7 ¢
Heavy Brass	....	6 ¢
Light Brass	....	3 ¢
Pipe Lead	....	2½¢
Tea Lead	....	2 ¢
Zinc	...	2¼¢
Rubber	..	4 ¢

Anthracite.— The very cold weather has not increased the demand. The market is also affected by the extremely low price of Soft Coal, which is selling at $2 per ton retail, owing to a railroad fight. Carload lots of 12 net tons or over are quoted as follows:

	Egg, Grate.	Sto. and Ch.
Chicago, Ill	$4.75	$5.00
Milwaukee, Wis	4.75	5.00
Kansas City, Mo	7.95	8.20
Council Bluffs, Iowa	7.95	8.20
Lincoln, Neb	8.10	8.35
Sioux City, Iowa	7.95	8.20
Aberdeen, S. Dak	8.00	8.25

Cheyenne, Wyo	10.00
All points between Denver and Missouri River	8.85

THE LATEST CIRCULAR sent out by Frank I. Maule, 328 Chestnut street, Philadelphia, Pa., is one of those curious publications that cannot fail to receive attention. It is a mixture of various colors and various sentiments put together in various ways, and altogether is a striking example of clever advertising. Mr. Maule makes a specialty of preparing commercial literature, as he terms it, which includes advertisements, catalogues, &c., *ad infinitum*.

DANIEL W. RICHARDS and Morton B. Smith, composing the firm of Daniel W. Richards & Co., dealers in Scrap Iron, have dissolved partnership by mutual consent. Mr. Smith has purchased the stock of the late firm and will continue the business at the same offices in the Manhattan Life Building, 64-68 Broadway, New York.

CONDITION OF THE

Hardware Trade.

THERE is a perceptible increase in the volume of business, but the demand is not as yet as regular and steady as might be desirable, a very good mail one day being followed by comparatively light orders the next. It is, however, an encouraging feature that the salesmen who are on the road generally send in hopeful reports. There is also an evident improvement in some lines, as, for example, Wire Nails, which are unquestionably in a better condition than for some time, with a vigorous demand, which tends to give tone to the market. Manufacturers are maintaining prices pretty well, considering the constant effort which is being made to induce lower quotations. There are, of course, many lines in which concessions are still being made, but on the whole manufacturers are indisposed to yield to the pressure, especially as prices are in some instances so demoralized as to approach closely to the cost line. Under the present circumstances it is to be hoped that manufacturers will refrain from unnecessarily slaughtering prices and do what they can to give steadiness and tone to the market.

Advices from Chicago. — January closes with the Shelf Hardware trade less active than when business opened in the early part of the month, yet its condition is regarded as fair, and the volume is certainly greater than that of the corresponding period of 1894. Considerable business is being done in spring goods, such as Wire Screens, Screen Doors, Poultry Netting, Refrigerators and kindred articles, but Builders' Hardware is moving slowly and Shelf goods are only being called for to sort up. Tinware, however, is in excellent demand and orders for this class of merchandise are as large as they have been at any time in the past. Prices continue low on Tinware, and as yet there is little indication of the advance which has for some time been expected. Staple goods are moving in only moderate volume, the extremely low prices now quoted having resulted in stimulating trade very slightly, if at all. Heavy Hardware is in satisfactory shape, the volume of business in January having been considerably larger than that of January last year. The volume is stated by some jobbers to be even larger in dollars and cents, which shows a decided improvement in trade, as prices now are at least 25 per cent. below those of January, 1894. The continued cold weather and abundance of snow have been of much benefit to jobbers by greatly increasing the demand for sleds, supplies and other articles going with them. The season in this respect has been the best for several years.

Notes on Prices.

Wire Nails.—Since our last report there has been a marked improvement in the tone of the Wire Nail market and prices are quotably higher. The improved tone was perceptible first in the West, manufacturers withdrawing the extreme prices which had been current and insisting on somewhat higher figures. Concurrently with this disposition on their part orders began to come in from the trade, a fact which had the effect naturally of giving the market a still better

tone and leading to the naming of slightly higher prices. The market in the East has already sympathized with the condition referred to and all the manufacturers are now naming higher prices than a week ago. The volume of business has been very large and most of the mills are full of orders for some time to come.

Advices from Chicago. — Manufacturers are making very heavy shipments. Authentic information from all the largest concerns selling in this market discloses the fact that the movement now is one of the greatest in the history of the trade. Running far beyond the current output and rapidly depleting stocks, they have been able without concert of action to advance their price until now the bottom price to the largest buyers is $1, Chicago or Joliet. The advance made by the manufacturers has so far had no effect on the jobbers, who continue to sell at the same low rates which have prevailed here for the past two weeks. They quote carload lots at 95 cents to $1, f.o.b. cars Joliet, or $1 to $1.10 for shipments from stock in Chicago.

Cut Nails.—The Cut Nail market has not in any marked degree shown sympathy with the improved condition in Wire Nails, quotations being substantially as last week. The volume of business has been moderate, though some improvement is reported, and there is perhaps a slightly better tone to the market.

Advices from Chicago.—Manufacturers report a fair trade in Cut Nails, but the local mill has not yet resumed operations. Quotations are unchanged. Jobbers quote small lots from stock at $1.

Barb Wire.—There are some indications of a slightly better feeling in Barb Wire, though quotations remain substantially as for the past few weeks. Small lots from store in New York are held at $2.15 to $2.20.

Advices from Chicago.—A very large trade is in progress; shipments from factory are heavy, manufacturers find that they made an error in not accumulating larger stocks during the dull season, as the trade would easily have absorbed much more Wire than is now available. Jobbers' quotations are still as low as those of manufacturers, being only $1.55 to $1.60, f.o.b. cars Joliet, for carloads of painted, and $1.90 to $1.95 for galvanized, or $1.70 and $2.05, respectively, for small lots to be shipped from stock in Chicago.

Eclipse Lawn Sprinklers.—In *The Metal Worker*, January 26, we described the Eclipse Lawn Sprinkler, put on the market by the Crescent Brass & Iron Works, Detroit, Mich. These goods are sold to the trade at the following net prices.

	Per dozen.
Eclipse Lawn Sprinkler	1.50

Binder Twine.—The Binder Twine market shows a somewhat firmer tone, with a moderate amount of business. Prices remain about the same as last reported. The Western Twine Company are making an effort to dispose of the large amount of Binder Twine which has been held by the bankers as collateral, and this Twine proves a somewhat disturbing element in the market. Some buyers consider this held over Twine inferior for use to new made Twine, yet the price at which it is offered affects the price of new Twine. The condition in which the wheat crop is found to be when the snow goes off will naturally affect the prospective demand for and prices of Binder Twine. The market is represented by the following quotations in 50-ton lots, the same prices in some instances being made for Twine in carload lots:

	Per pound.
Sisal	$0.05
Standard	.05
Manila	.06
Pure Manila	.07¼

Wrought Iron Pipe —In view of the irregular and somewhat demoralized condition which has characterized the Wrought Iron Pipe market for some time, the action of the manufacturers at their meeting held in Pittsburgh January 30, is of more than usual interest and importance. Information in regard to the action taken is given in another column.

Expanded Metal Lath. — J. K. Combs, 107 Chambers street, New York, manager of the Central Expanded Metal Company (Chess, Cook & Co.), Pittsburgh, Pa., announces the following new prices on expanded metal lath. Style A lath, 23 cents per square yard: Style B lath, 19 cents per square yard; Style C lath, 23 cents per square yard; For small lots a charge for cartage will be made in New York City. In lots of 1000 yards no charge for cartage this side of Fifty-sixth street, N. Y. Above Fifty-sixth street a small charge is made for men's time.

Glass.—The present outlook for the Glass trade is not particularly encouraging. Both manufacturers and jobbers decry the low prices at which Glass is being sold, but with the limited demand at the present time there seems to be no reason for any immediate advance. It is understood that jobbers will have abundant stocks of Glass on hand when the spring opens, which have been bought at low figures, and it appears that they will control prices. Manufacturers have probably made the Glass to fill the orders placed by jobbers, and what is now made will be piled up at factory. Although Glass manufacturers have had conferences looking to some united action for improving the condition of the market, no solution of the question has yet been reached The New York market is represented by the following quotations: For small lots of Double or Single Strength Glass in store, 85 and 10 per cent. discount; in car lots from factory, 88 per cent. discount for Single and 90 and 5 per cent. discount for Double Strength Glass.

Old Rags, Paper, &c.—Demand is fair and dealers' purchasing prices substantially the same as those quoted last week, namely:

No. 1 White Rags	℔	lb	3 @	3¼¢
No. 2 White Rags	℔	lb	2¼ @	2½¢
Mixed Rags	℔	lb	¾ @	1 ¢
Blues and 3ds	℔	lb	1⅛ @	1⅜¢

Old Rubber.—The following quotations represent about the prices paid by dealers, New York delivery:

Car Springs, ton lots	℔	lb.	$0.03¾ @ .04
Rubber Shoes, carloads, delivered at factory	℔	lb.	@ .05¼
Rubber Shoes, less than carloads	℔	lb.	@ .04¾
White Wringer Rolls	℔	lb.	@ .03⅞
White Syringes	℔	lb.	@ .03⅞

Wallace & Sons' 1895 Catalogue.

We are advised that the old established house of Wallace & Sons, Brass and Copper Rolling Mills, with sample rooms and warehouses at 29 Chambers street, New York, and mills at Ansonia, Conn., are about to issue a new illustrated catalogue. There is little doubt that it will illustrate the progressive position this house have for nearly half a century maintained in the Brass and Copper trade. From a cursory examination of the proof sheets kindly shown our representative, we judge the book will be a very acceptable addition to the catalogue libraries of metal workers, hardware merchants, &c., and will, on account of its complete price-lists of different articles, as well as its tables of measurements, weights, &c., become a standard book of reference for dealers in their line.

We notice that special attention has been given to details, particularly in revising various price lists hitherto more or less confusing, and these changes, together with the profuse illustrations of the various articles they manufacture, make everything quite clear, even to those who may not be thoroughly familiar with the business. The book is also illustrated with cuts showing the improved manner of packing various articles for the convenience and utility of the Shelf Hardware trade, such as Star Brand Copper Rivets and Burrs, Copper Tacks and Nails, Spelter, Solder, &c.

Care has also been taken in specifying the stock sizes of the different goods they carry to enable customers who are in urgent need to be able to see at a glance what they can order, with the assurance of receiving prompt shipment.

Several pages in the back of the catalogue are devoted to tables of weights, measurements, &c., of different Metals, such as Sheet Copper, Seamless Brass and Copper Tubing, Brass and Copper Rod, &c., so as to enable the trade to estimate on goods of this description comprehensively.

THE YARNELL TIN & HARDWARE COMPANY, Somerset, Ohio, have been formed with a capital of $15,000.

Keuffel & Esser Co.'s Catalogue of 1895.

26th Edition.

Enlarged by over 100 pages. The most complete and reliable catalogue, representing the largest and most complete stock in this line.

— VICTIMIZED. — "If I live long enough," he said moodily, "I hope I'll get over being a natural mark for any bunco-steerer that happens to be loose."

"What's the matter?"

"I concluded I'd have to economize, so I sent 50 cents to a man who said that was all he'd charge to tell me how to make a little money go a long way."

"And what did he tell you?"

"He simply wrote: 'Send five cents by express to San Francisco.'"—*Washington Star.*

— "WHICH song would you rather hear Miss Warble sing?"

"'Mariner Bold.'"

"But she doesn't sing that at all."

"I know. That's why I prefer it."—*Judge.*

— A MAN who asks for credit at all times very seldom asks the price of an article. It don't interest him, inasmuch as he don't intend to pay for it.—*Exchange.*

SECOND EDITION.

PRACTICAL HINTS

—ON—

JOINT WIPING,

FOR BEGINNERS IN PLUMBING,

WITH THIRTY-FIVE ILLUSTRATIONS.

43 PAGES. PAPER, 25c.

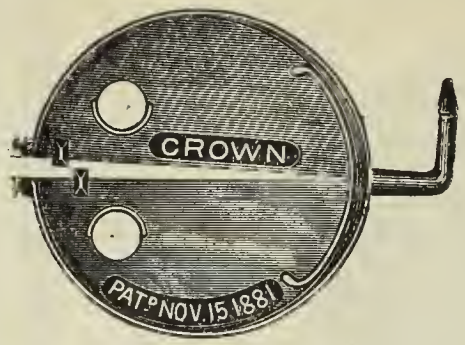
This book contains a reprint from *The Metal Worker* of two articles on the method of Joint Wiping, an operation calling for a very large degree of manual skill.

The first account is written by a practical plumber, and is illustrated from photographs faithfully representing the hands and tools when wiping joints in various positions.

The second account, by an expert joint wiper, is also illustrated from photographs and will prove of great assistance to learners.

Ample instructions are given on preparing the pipes previous to wiping the joints, with full descriptions of all tools and appliances used.

The pamphlet, in short, gives all the assistance that description of the work can furnish and is the most practical and complete account of joint wiping that has been published



Sent, post-paid, on receipt of price, 25c.

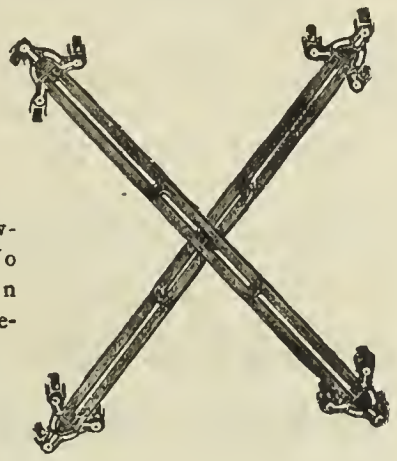
Gem Stove Truck

Not only accommodates itself to a stove with four legs, but, as shown in illustration, is equally as complete with a stove of three legs, a feature no other truck possesses. The adjustment is so perfect that one man can mount any ordinary stove with ease. Price, $30.00 per dozen. 1-3 doz. in neat case.

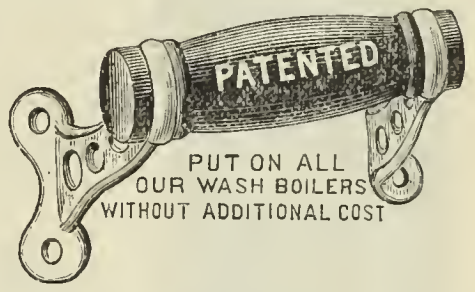
DISCOUNT TO THE TRADE.

Address **CHAS. F. FOX, - DAYTON, O.**



Simplicity, Adjustability, Neatness and Strength.

THE Eclipse Adjustable Stove Truck. The newest, neatest, lightest, strongest and best. No side strain or tilting. Bearing always directly in center. All steel and malleable iron. Lasts a lifetime. Price, $18.00 dozen.



MANUFACTURED BY

STELLWAGEN & KYNOCH, St. Ignace, Mich.

ROYAL

WASH BOILER HANDLE.

PATENTED.

We call the trade's special attention to the Royal Handle, being the cheapest and the most durable handle in the market, fully protected by a number of letters patent, and all manufacturers using the handle report that their trade on wash boilers has largely increased. Over 100,000 handles sold in our local trade last year.

The advantages gained by using the Royal Handle can be readily seen, as it far excels the old fashioned tin or iron drop handles in beauty and strength, fits the hand perfectly and is always cold and adds greatly to the general appearance of boiler. Manufactured only by

HASLET, FLANAGEN & CO.,

Before. After.

Covert Pants Stretcher.

THE Covert "Pants Stretcher" will restore the pantaloons to their original shape and length.

It removes all **WRINKLES and BAGGING AT THE KNEES,** giving them the appearance of having just left the tailor's hands.

It also holds the pants in a convenient position for brushing and cleaning.

The Stretcher cannot get out of order, and can be adjusted in the pants in a few seconds.

It being applied inside the pants, it obviates all objections prominent in other stretchers.

It is made of steel wire, and being in sections can be packed in a valise when traveling. Sold by the trade, or

Sample pair sent by mail to any address, free of postage, on receipt of $1.00.

MANUFACTURED ONLY BY

COVERT MFG CO., West Troy, N. Y.

— AN EMBRYO JUDGE OF INSURANCE CASES.—Among our real estate assessors a year or two ago was one named Dennis McElhinney. On his rounds he came to the habitation of his friend Michael Mulcahy.

"Good mornin', Michael," said he.

"Good mornin', Dinnis," returned Mulcahy.

"It's assissin' this mornin' I am, Mike," said the official.

"Thin be aisy wid me, Dinnis. What wid rale estate assissments and shtrate assissments, it's hard work to save enough to pay me Tammany assissment."

"I'll be aisy, Mike. I'll put yez down for tin dollars a fut. Thot will be tirty times tin is tree hundhred for the lot and twinty for the goat."

"Phwat!" cried Mulcahy.

"Tree hundhred for the lot and twinty for the goat."

"The goat's not rale eshtate!"

"It is so, undher the new law."

"Go 'way wid yez!"

"I can prove it to yez," said the assessor, drawing out his instructions. "Rade that, will yez: 'Assiss at its proper valuation per front fut all property boundin' an' abuttin' on both sides of the shtrate.' Manny's the toime I've seen your goat a-boundin' an' a-buttin' on both sides of the shtrate. Twinty dollars for the goat, Mike."—*New York Herald.*

— THE CRAFTY SMALL BOY.—A small tin bank was kept on the Hinman's dining table, and every time any of the four little Hinmans got a spot on the snowy cloth, he or she forfeited a penny, which was dropped into the bank and used for charity.

One day Rupert, a boy of seven, was discovered rubbing with a spoon a part of the cloth hanging below the table in front of his chair.

"What are you doing?" asked mamma.

"Well, I'm trying to rub two spots into one; that's what!"—*Harper's Bazar.*

PURITAN WASH DOWN WATER CLOSET.

Best Closet Yet Produced for Either Public Places or Private Houses.

In presenting this Water Closet Apparatus to Architects and Plumbers and those interested in Sanitary Plumbing, will say that our aim has been to **Improve the Quality, Simplify the Construction and Reduce the Cost of Fitting in Place,** and we feel confident that we have done all this in the present Apparatus, and more too, **as it will discharge more matter, keep cleaner with less water and make less noise in the operation** than any Water Closet Apparatus now on the market.

The Closet is especially well adapted for Fire Proof Structures, as the Soil Pipe may be run above the floor, either behind or on the face of the finish. Another very good feature—stoppage can only take place in the bowl (where it can be reached from the top). Anything that passes this point will not lodge in the Soil Pipe.

These Closets are made of Vitreous Earthen Ware—that is, an absolutely non-absorbing material, warranted not to craze. Each Closet is stamped with a Bull's Head, our trade-mark.

The tank is provided with a cover finished to match. This cover deadens the noise, prevents fouling by dust and also prevents malicious persons from getting at or throwing anything into the tank.

The tank is worked either by hand action or seat action.

The distance from top of tank to finish of floor is 2 feet 6½ inches. From face of wall to front of Closet, 2 feet 1¾ inches. Depth of seal in Closet 2¾ inches.

THE

NEW ERA

Wrought Steel Sink

Drawn from one plate of steel and superior to cast iron sinks in every particular, being lighter, stronger and more durable. It is well known that cast sinks break easily in shipping, storing and placing in position for use and from other causes. This sink being made of wrought steel will not break from any cause whatever, and being less porous than cast iron is comparatively odorless.

The bottom is formed tapering to the center and the outlet, giving the sink perfect drainage. The bowl and projecting thimble are stamped in one piece from the same plate, enabling the attachment of strainer and pipe more satisfactorily than is possible with cast sinks.

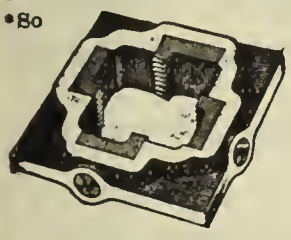
Don't Buy

*Maule's "Skeleton" Pipe Die

If You Wish to Avoid

A Pipe-Threading Die extremely easy of operation by reason of the **proper clearance** of its cutters;



Of surpassing **durability** secured by the accurate and uniform **temper** of said Cutters;

Having Cutters that when dull may be removed in a moment, and **sharpened on a grindstone or emery wheel;**

Of phenomenal **cheapness,** arising from **small first cost** coupled to **excellence** of quality.

If by chance you do not think these points, or the saving of money, objectionable,

*80

Send us a Postal Note for 62 Cents (do not send us any postage stamps), and we will mail you a sample one-inch Die, either 2⅜ or 2½ x ¾ thick, which we hereby agree to take back if not to your satisfaction.

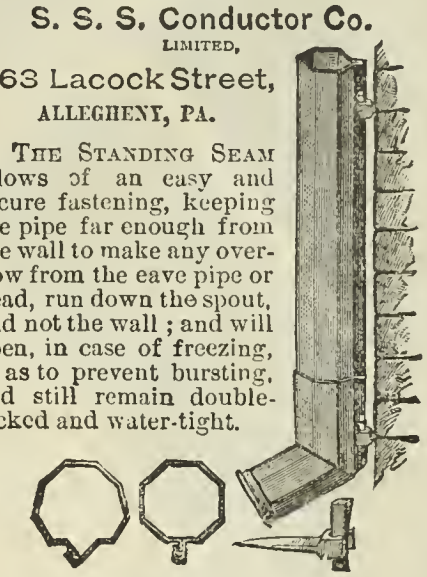
PATENT

EXPANDING WATER CONDUCTOR.



MANUFACTURED BY THE

S. S. S. Conductor Co.

LIMITED,

163 Lacock Street,

ALLEGHENY, PA.

THE STANDING SEAM allows of an easy and secure fastening, keeping the pipe far enough from the wall to make any overflow from the eave pipe or head, run down the spout, and not the wall; and will open, in case of freezing, so as to prevent bursting, and still remain double-locked and water-tight.

Made in 6-foot lengths of a single sheet of SOFT STEEL.

GALVANIZED, KALAMEINED or LEADED.

The Irwin & Reber Expanding Water Conductor Pipe has been extensively used through the United States and Canada for the past ten years and has proved itself to be the best in the market. Send for Price-List.

523 Seneca St., Cleveland, O.

— NEW TACTICS.—At the session of the school for non-commissioned officers of one of the companies stationed at Fort Wayne, the following question was asked of Sergeant —— :

"What is strategy? Give me an instance of it."

After studying for a moment or two the sergeant gave the reply:

"When in battle and you are out of ammunition and don't want the enemy to know it, it is good strategy to keep right on firing."—*Exchange.*

— CAUGHT IN THE CURRENT.—"You know the fish hook is the cause of many sinful, awful yarns?"

"Yes; it's a nuisance—something to a-bait."—*Atlanta Journal.*

Standard Books
—ON—
FOUNDRY PRACTICE.

The Encyclopedia of Founding and Dictionary of Foundry Terms,

used in the practice of molding. Together with a description of the tools, mechanical appliances, materials, and methods employed to produce castings in all the useful metals and their alloys, including brass, bronze, steel, bell, iron and type founding, with many original mixtures of recognized value in the mechanic arts. Also aluminum, plating, gilding, silvering, dipping, lacquering, staining, bronzing, tinning, galvanizing, britannia-ware, German silver, nickel, soldering, brazing, ores, smelting, refining, assaying, etc. By SIMPSON BOLLAND, Author of "The Iron Founder," "The Iron Founder" Supplement. 12mo.: cloth.....**$3.00**

The Pattern Maker's Assistant

Embracing lathe work, branch work, core work, sweep work and practical gear constructions, the preparation and use of tools, together with a large collection of useful and valuable tables. Sixth edition. By JOSHUA ROSE, M. E.; illustrated with 250 engravings; 324 pages: cloth.....**$2.50**

Modern Molding and Pattern Making.

A practical treatise upon pattern shop and foundry work. By JOSEPH P. MULLIN, M.E.: 257 pages; cloth; illustrated. **$2.50**

Iron and Steel Founding.

Illustrated with 39 diagrams. By C. WYLIE. Second edition, revised and enlarged; 324 pages; 8vo; cloth... .....**$2**

The Practical Brass and Iron Founder's Guide.

A treatise on brass founding, molding, the metals and their alloys, etc. By JAMES LARKIN, late conductor of the brass foundry department in the Penn Works, Philadelphia. A new revised and greatly enlarged edition. Contents: Among the most important and entirely new sections of this edition of this valuable and popular book are the following: Behavior of Metals and Alloys in Melting and Congealing; Malleable Iron Castings; Wrought Iron or Mitls Castings; Manufacture of Steel Castings; Casting of Brass; Casting of Bronze; Bell Founding; Chill Casting; Casting without Core; Casting on to Other Metals; Casting Iron and Other Metals Upon Lace, Embroideries, Fern Leaves and Other Combustible Materials; Some Modern Bronzes. In one volume; 12mo; 400 pages.....**$2.50**

American Foundry Practice.

Treating of loam, dry sand and green sand molding, and containing a practical treatise upon the management of cupolas and the melting of iron. By THOMAS D. WEST, practical iron molder and foundry foreman. Fully illustrated. Eighth edition, revised. 408 pages; cloth.....**$2 50**

The Iron Founder.

A comprehensive treatise on the art of molding, including chapters on core-making, loam, dry sand and green sand molding, also crystallization, shrinkage and contraction of cast iron and a full explanation of the science of pressures in molds, added to which are formulas for mixtures of iron, tables, rules and miscellaneous information. By SIMPSON BOLLAND. Illustrated with over 300 engravings. 12mo, cloth....**$2.50**

The Iron Founder Supplement.

A complete illustrated exposition of the art of casting in iron, comprising the erection and management of cupolas, reverberatory furnaces, blowers, dams, ladles, etc., mixing cast iron, founding of chilled car wheels, malleable iron castings, foundry equipments and appliances, gear molding machines, molding machines, burning, chilling, softening, annealing, pouring and feeding, foundry materials, advanced molding, measurement of castings, wrought iron, steel, etc. Also the founding of statues, the art of taking casts, pattern modeling, useful formulas and tables. By SIMPSON BOLLAND. Illustrated with over 200 engravings: 400 pages; 12mo: cloth..... ...**$2.50**

Art of Coppersmithing.

A Practical Treatise on Working Sheet Copper in all Forms.

By JOHN FULLER, Sr.

327 Pages, 474 Illustrations, 7 x 10 inches, Cloth. Price, $3.00.

This work, prepared at great labor and expense, is reproduced from *The Metal Worker*, and forms an exhaustive treatise on the Coppersmiths' Art, being the only volume on that subject that has been published. It is beautifully illustrated with 474 pen and ink drawings, and is bound and printed in the best manner.

Hicks' Guide

FOR

Builders,

Comprising an easy, practical system of Estimating Materials and Labor for Carpenters, Contractors and Builders.

A comprehensive guide to those engaged in the various branches of the building trades.

By I. P. HICKS.

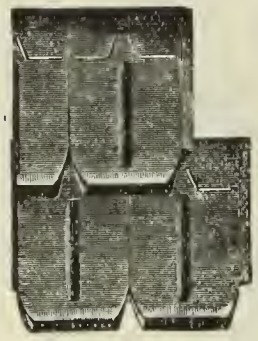
160 Pages, - 114 Illustrations.

Bound in Cloth, Price, - $1.00

This book presents to the trade, first, an easy, practical system of estimating materials, in concise form for reference. In the next place is given the average day's work of all kinds, and the average rates on which to figure in almost every detail of building construction.

Material and Labor, including Lumber, Carpentry Work Masonry, Plastering, Hardware, Painting, etc., are among the principal divisions. These in turn are illustrated and ably treated under numerous sub-divisions, showing step by step the entire work of estimating, contracting and building, together with the best and most practical methods of doing the work.

This is followed by a section given to the Geometrical Measurements of Roof Surfaces, with numerous illustrations and examples. It embraces a new and simple system of framing curved roofs, also the simplest methods of roof framing of every description, with practical examples thoroughly illustrating nearly every conceivable form of roof and showing many points never before presented.



The volume also contains a chapter on Mitering Planceers, Moldings, etc., illustrating and describing how to make, in an easy, practical manner, many joints which are the source of no little trouble and annoyance on the part of the workman.

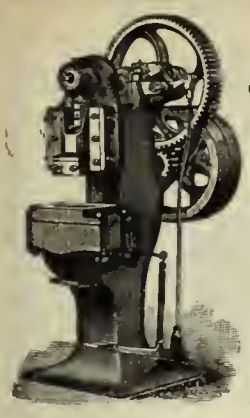
POCOCK'S ECCENTRIC

FORMING MACHINE.



We invite your attention to this new Former for Tinners' and Sheet-Metal Workers' Rolls, on which we claim rapidity of operation, superior construction and durability. The back roll is moved by eccentrics instead of screws, and can be changed instantly from the smallest circle to the passing of a straight sheet. It will flare metal easier and better than any other machine in use. You can get closer to front roll, therefore bend a smaller circle. For sale by all leading jobbers. Send for circular to

Tired Listener: "If it hadn't the man could have been rescued."—*Exchange.*

—HAUTEUR.—"Are you used to serving roast beef rare?" said the lady who was endeavoring to learn whether she suited the new cook.

"No, ma'am," was the loftily spoken reply. "Up to me prisent employment, Oi've been used to serving it frequent."—*Washington Star.*

— HYGIENIC DIETING.—The Old Housekeeper: "Why do you make some of your dumplings large and others small?"

The Young Housekeeper: "Because the doctor advises a variety in our diet."—*Exchange.*

— ONE of the regulations of the West Boston Bridge Company reads: "And the said proprietors shall meet annually on the first Tuesday of June, provided the same does not fall on a Sunday."—*Exchange.*

THE METAL WORKER

PATTERN BOOK.

SEVENTH EDITION.

This is a handsome volume of 242 pages, printed on heavy paper, and substantially bound in cloth. It is illustrated by upward of 520 line engravings.

The work is comprised in five general divisions or chapters, bearing the following titles: (1) Definitions and Technicalities; (2) Drawing Tools and Materials; (3) Geometrical Problems; (4) The Art and Science of Pattern Cutting, and (5) Pattern Problems. These titles sufficiently indicate the subject matter of the several parts.

The List of Problems

demonstrated is very extensive, and embraces almost everything of common occurence in the sheet-metal trades, with enough of the exceptional to show methods adapted to special requirements. This chapter, in short, is a ready reference book for all who have pattern cutting to do. Each demonstration is complete in itself. A carefully prepared index facilitates reference. The work has been prepared for sheet-metal workers in general, and not for any one class in particular. The tinner will find in it what he requires, without the necessity of studying the cornice problems. The cornice maker will find in it everything from a simple miter to the most complex problems, so arranged as to meet his requirements, without the necessity of going through portions in which he is not interested. The general student will find the entire subject presented in such a manner as will facilitate systematic study. The rapidity with which each edition has been exhausted, and the universally favorable comments it has called forth, prove that it fully meets the want it was intended to supply

PRICE, POST OR EXPRESS PAID, $5.

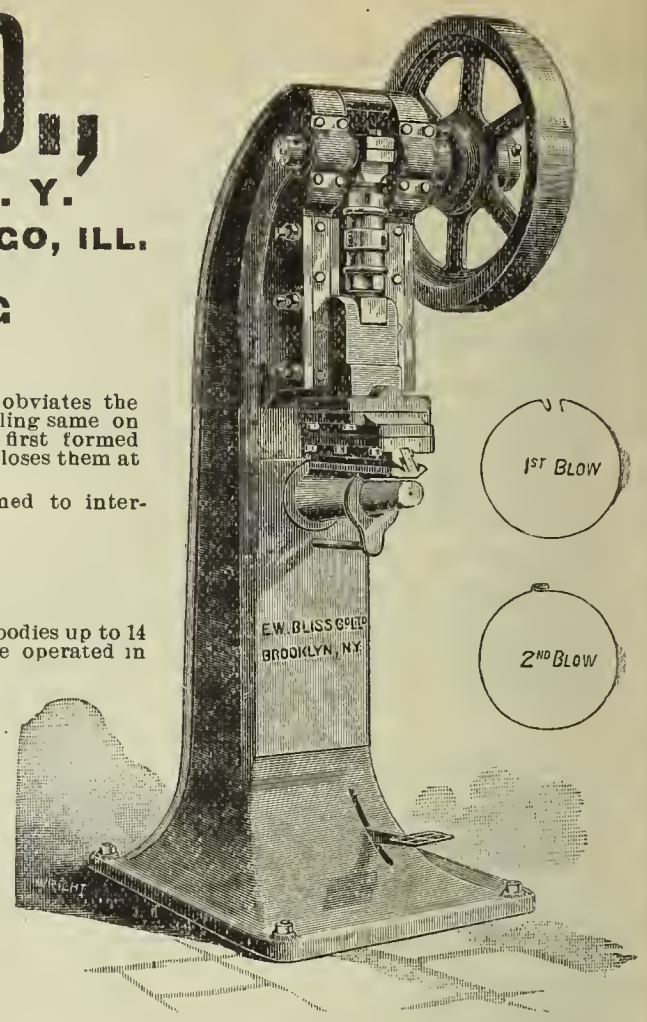
DUPLEX FOLDING AND SEAMING MACHINE.

THIS machine is designed to facilitate the manufacture of lock-seamed tinware. It obviates the necessity of using a bar-folder for forming the hooks on the body blank before rolling same on the forming machine. Its operation is exceedingly simple and reliable. The blank is first formed in the rolls, then placed in the machine, which forms the two hooks at one stroke and closes them at a second operation. The advantages obtained are:



First—That the blank is rolled in the flat, not having any hooks previously formed to interfere with the operation.

Second—That both edges are hooked at one blow

Third—That the hook forming and closing are done in one handling.

Fourth—That the seam is more uniform than if started in the bar-folder.

The horn can be arranged to throw the seam inside or outside. All sizes of bodies up to 14 inches long can be done on the one horn. These horns and forces are not adapted to be operated in presses having more than ½ inch throw.

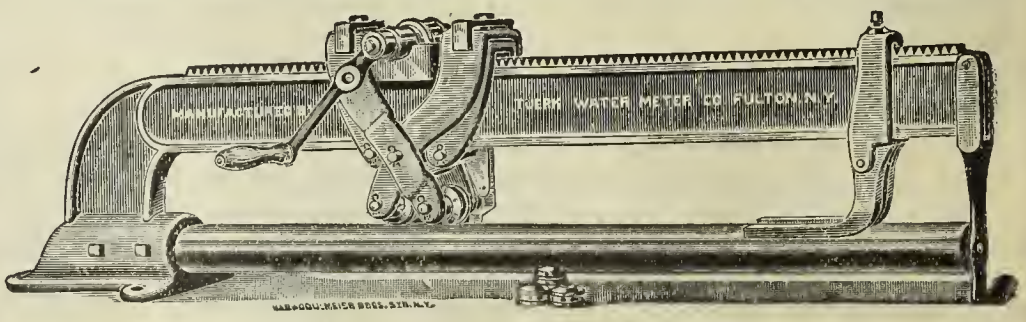
GEO. A. OHL & CO.,

Successors to the Calvin Carr Cornice Machine Co.,

157, 159, 161 Oraton St., Newark, N. J.,



Are manufacturing three different kinds of brakes—the well-known Automatic Brake, the improved Double Cam Brake and a Hand Lever Brake. This meets the demand of the trade in every respect, and on account of low prices is in reach of every cornice maker.

PATENTED AUTOMATIC BRAKE.

We also manufacture Circular Machines, Squaring Shears, Slip Rolls, Drop Presses, Shears and Punches, Scroll Shears, Brace and Wire Benders, and all machinery used by sheet-metal workers. Special attention called to our improved Hammering Machines, patented December 27th, 1892 Send for our illustrated catalogue.

TUERK WATER METER CO.'S GROOVER.

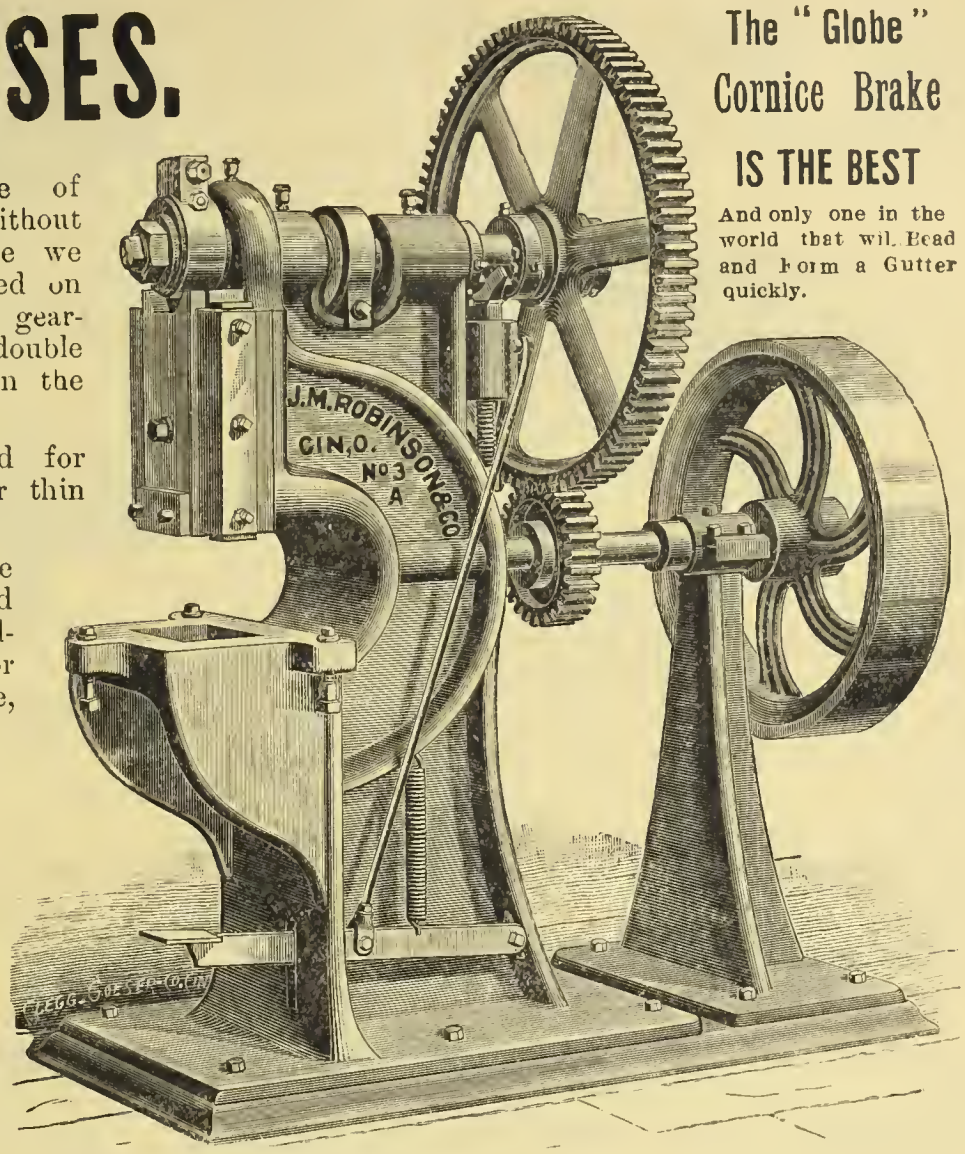
Manufactured by TUERK WATER METER CO., Fulton, N. Y.

POWER PRESSES.

We are manufacturing a full line of Power Presses, as illustrated, with or without gearing, single or double (when double we place two presses back to back secured on same bed plate, operated with one set of gearing and one fly wheel, serves as a double press, punch on one end and shear on the other at the one and the same time)



These presses are especially adapted for cutting, punching and shearing thick or thin metal and a host of other purposes.

Especial features of construction are embodied in our presses to be found in no others, which are of material advantage in getting out your work. For full description, write for catalogue, please

Apollo Best Bloom

ıere is great difference in galvanized iron.
)u can always get flat sheets and workable iron, if you of a first-rate jobber. No jobber that has any careful e could hold it without the Apollo brand.
ıere are three reasons for selling common iron: (1) it s less by the ton, and generally is sold for the same in l quantities; so the profit on it is greater; (2) it is enough for some uses; (3) and many metal-workers t know the difference.
ıe difference is: the Apollo is flat (no buckling) and (no breaking when bent) and true to gauge—(no loss ıying by weight and selling by measure.).

IMPORTANT ANNOUNCEMENT.

To Our Patrons and the Trade Generally:

Our new Catalogue for 1895 will be ready for distribution within a few weeks. We take this means of announcing in advance of its publication that we have very carefully studied the requirements of the trade in every particular, and that our lines will be complete. We will place on the market specialties in entirely new goods that will commend themselves both by reason of popular prices and their many attractive and desirable features. In addition to our very popular Oilgas Cook Stoves, containing our improved 1895 Burners that are giving such perfect satisfaction, we have something entirely new in the line of special Lamp Stoves at special prices; also Sheet Steel Circular Burner Oil Cook Stoves. Write for further information and prices.

DEALERS!

All Weak Points About Vapor Stoves

are not called to your attention by unscrupulous manufacturers or their salesmen. They often palm off imperfect and faulty stoves as perfect, and jolly you into the belief that you have struck a bargain.

But when summer comes and truth comes to light, as it invariably does in the vapor stove business, vexation and disappointment come with it. Vexation, because you have been duped, disappointment, on account of the loss of a season's profit.

Better handle a *good line* at a fair profit than a *poor* line at a *bargain* profit. There is no such thing as a "bargain," especially in the vapor stove business. *Proof*—Review the past???

Better buy from a responsible manufacturer or his legitimate jobber, especially of one whose integrity is unquestioned, and one whose knowledge of the vapor stove business secures you an honest deal and prevents the imposition of fakes or shoddy goods. *There are a few of us left.*

Better buy a good line to be successful. A *bad* stove is a very poor purchase at *any* price.

Better look for Protection.

Protection in order to be of service to you must begin at home. See that this point is not overlooked when casting about for a line for 1895.

Better think this over.

The old adage reads, "Make Haste *Slowly*." This is a weighty proverb. The more so when you consider that the best versed manufacturers in the vapor stove industry are not offering any new inventions or innovations for the coming season.

Yours respectfully,

THE SCHNEIDER & TRENKAMP CO.,

Hear 'em Holler!
Oh, my! ain't it Funny?
The "combine" at last see their Waterloo.
The beginning of the end of the Vapor Stove Association.

No wonder they holler, for they know not "where they are at." The L. & H. Process did it.

Dear people, don't be alarmed when you hear their noise. It is the old story of great cry and little wool. Have you read their bluff? Of course you have. Ain't it sublime? Oh, my! what a lot of advertising for us. A regular snap.

Just as soon as the dealer reads their warning he gets on his fighting clothes and at once looks into the merits of the L. & H. Process. We are deluged with orders, and are all smiles, for the trade stands by us and will not be intimidated by the "combine." We know who our friends are, and therefore congratulate ourselves. When the dealers see our L. & H. Process stove they will have no other. The "combine" know this; hence all the commotion, and all they can do is to rush into print in their efforts to stem the return of their boomerang, but it does not work and in their agony they ask themselves "how can it was?"

Buy nothing but the L. & H. Process. **We are with you. Your interests** are ours. **We are here to stay.** The **L. & H.** mark shines **brighter than ever,** for **"It's a good thing, push it along."** Hurry up and write for catalogue so you will not be left.

A. J. LINDEMANN & HOVERSON CO., Milwaukee, Wis.

Announcement of

An Important Meeting to take place at Offices of

The Ferrosteel Company,

Wade Building, Cleveland, Ohio,

Monday, February 4th, 1895—And following days.

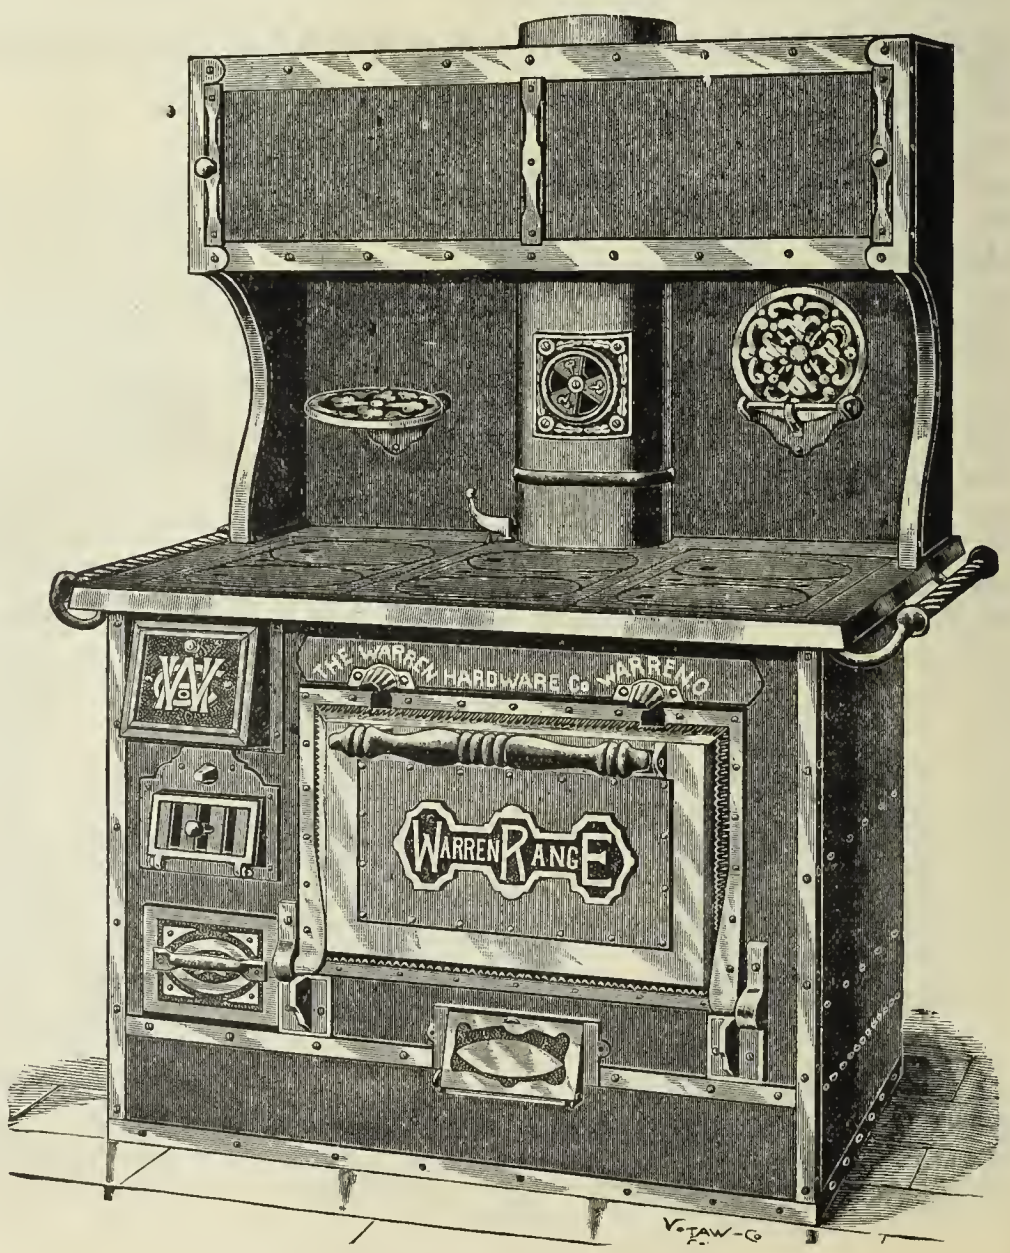
This meeting is one of orders and inquiries for Ferrosteel Ranges that will be received. Also applications for agencies. Orders from traveling representatives, too. Will your order, inquiry or agency application be received with others? It's the style now to handle Ranges made of Ferrosteel. New sizes for 1895 Spring trade.

THE

Warren Steel Range.

IMPORTANT ANNOUNCEMENT.

To Jobbers and Retailers of Steel Ranges:



Don't fail before placing your order for Steel Ranges to get catalogue and prices on our new line of Warren Ranges for 1895. New and original and the finest line of Ranges on the market. With Duplex Grate to draw out front of range without disturbing fire linings. Full size opening of oven 18 x 20 x 14, 20 x 22 x 14 and 22 x 23 x 14. Lined throughout with asbestos. Write for prices and catalogue.

MANUFACTURED BY

THE WARREN HARDWARE CO.

7 Market Street,

WARREN, OHIO.

Merchants can now buy their entire stove line from
The Michigan Stove Company.

It has been said that in America TWO CLASSES of Stoves and Ranges are sold, viz.:

"GARLANDS" AND OTHERS.

At the very head and front of the "Others" stands our new line of

"MICHIGAN" Stoves and Ranges,

Which are unquestionably the latest, handsomest and most artistically-designed Stoves and Ranges to be found upon the market at anything like the price at which they are sold.

They are made under our own supervision; by same workmen and out of the same material from which "Garlands" are made, and this fact of itself should be sufficient to cause them to be preferred by discriminating merchants and consumers, as against all other brands, excepting the invincible line of "Garlands."

Acorn Ranges.

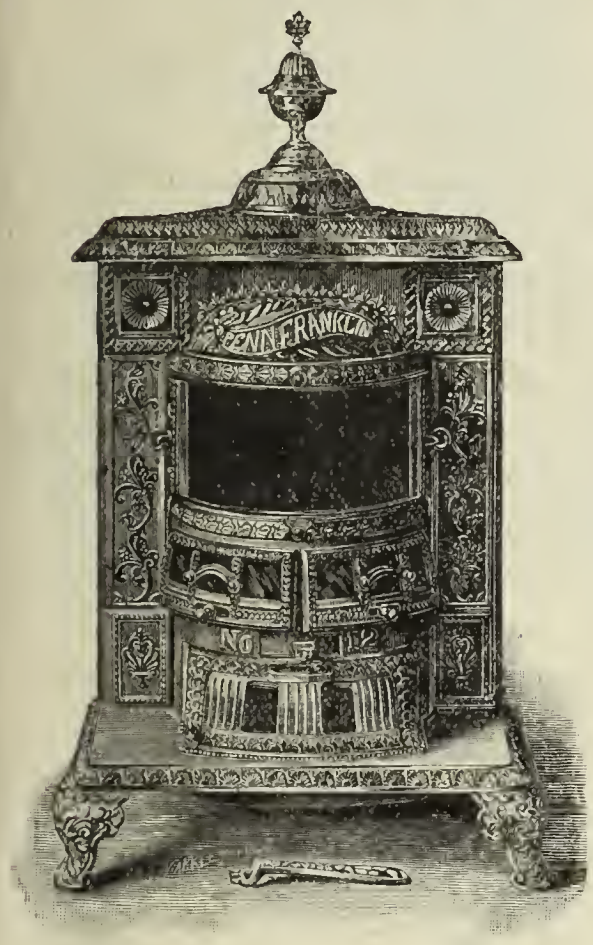
The pushing, energetic stove dealer who does not sell **Acorn Ranges** is making a great mistake. The same effort expended to sell **one** range of other makes will sell **two** or **more** Acorns. After an **Acorn Range** is sold it stays; what is better, it is **a** constant advertisement, **and** will sell more.

Every stove dealer who is anxious to **increase his business,** who wishes to make **more money,** and to do it easily and quickly, should at once write us for circulars and prices of **Acorn Stoves** and **Ranges.** They are made to use any kind of fuel, and for every section of country. They will change a poor business into a good one. Your competitors can do the complaining about "hard times" if you sell **Acorn Ranges.**

RATHBONE, SARD & CO.,

Albany, N. Y. **Chicago, Ills.**

Detroit, Mich. **New York City.**



FOUNDRIES:

Mt. Penn Stove Works,

READING, PA.

A FEW WORDS

TO THE PROGRESSIVE DEALER.

THE CINDERELLA KITCHENERS

Are an entirely new series of

ALL CAST IRON RANGES,

Adapted for burning

HARD OR SOFT COAL OR WOOD.

The Reservoir is Planished Copper, and holds fifteen gallons.

They have embodied in their construction many new and desirable features that are thoroughly practical and will meet the approval of the "up to date" dealers. The Cinderella Kitcheners are also made with feet and skirting in lieu of the Low Closet. A full complement of High Shelves and High Closets accompany the same. Every appointment is the latest, and for excellence of construction and beauty of design they cannot be excelled.

Made in the following sizes:

No 716,.....	Oven 16 x 16, 10½	inches high.
718,.....	18 x 18, 11½	"
818,.....	18 x 18, 11½	"
719,.....	18 x 20, 12½	"
819, ...	18 x 20, 12½	"
821,.....	20 x 22, 13½	"
921,.....	20 x 22, 13½	"

IF YOU ARE INTERESTED WRITE FOR PRICES.

We are makers of a complete line of Stoves and Ranges under the trade-mark of

"CINDERELLA."

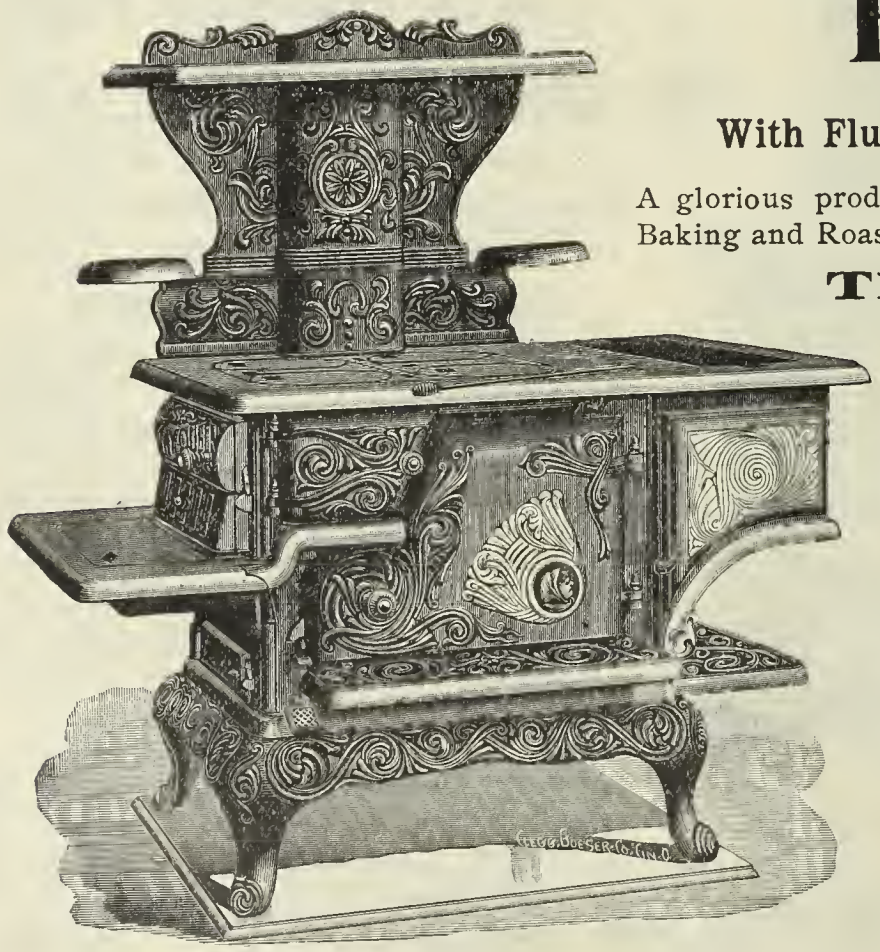
We Would be pleased to send our catalogue upon application.

DeHAVEN & CO., Limited, - - Pittsburgh, Pa.

Taplin, Rice & Company,

——Manufacturers.——

DICTATED BY P. **Akron, Ohio,** January 29, 1895.



BY THIS we beg to call the attention of the trade to the fact that during the current year we will be on the market with several new patterns of Steel Ranges and Heating Stoves, of superior construction, ornamentation and attractive form, the patterns of which are well under way and will soon be ready for the sand. The Climax Steel Range, which will be made in all the various conventional forms and styles, will be both as to construction and appearance second to none on the market. We will also have ready for the trade in due time a "Climax Air Blast" and "Climax Air Tight" heating stove in different sizes, the constructive features of which will be a radical departure from any pattern of stove ever offered, and we feel well assured they will wherever introduced take a leading position in the line of special heaters. Cuts and prices of these Ranges and Stoves will be mailed on application at an early date, and we are confident you will feel justified in deferring your order for supplies until samples or cuts of stoves named may reach you.

With grateful appreciation of former courteous favors shown us by the trade, we remain,

Very respectfully,

TAPLIN, RICE & CO.

MY QUEEN RANGE.

With Flush Reservoir, for Wood Only.

A glorious production, heavy, well proportioned, perfect in Baking and Roasting Qualities, and above all a fuel saver.

11TH SEASON.

Putnam Foundry and Machine Corporation,

PUTNAM, CONN.

— CRUELLY SURPRISED. — When the gentleman at the desk had attended to the cases of various applicants he turned to a pleasant-faced, well dressed man who was patiently awaiting his chance to get in.

"Well," he said to him with a smile, "what can I do for you to day?'

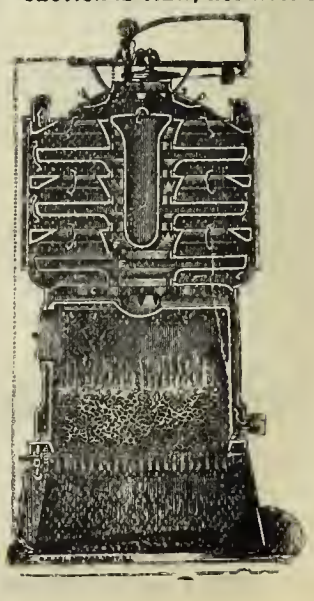
"Nothing," was the quiet response.

"Ah, that's pleasant; everybody seems to want some sort of a favor. Come in and sit down; you are a relief."

The pleasant-faced man bowed and accepted the invitation. "On the other hand," he said, when he was comfortably fixed, "I want to give you something."

"That's nicer than ever," smiled the host. "I've heard that it was better to give than to receive, but I've never had much chance to try both."

The visitor took a book out of his pocket.



"I want to give you," he said, bowing again, "an opportunity to put your name down for the finest work ever sent out by any publishing firm in— " but he never finished the sentence.—*Exchange.*

SECOND EDITION.

KITCHEN BOILER CONNECTIONS.

A SELECTION OF

Practical Letters and Articles Relating to Water Backs and Range Boilers.

Compiled from THE METAL WORKER.

71 Illustrations, 8vo, 140 Pages, Cloth, Price, $1.00

The book is well got up and the information well given. Those interested in works of this character will do well in buying it.—*The Plumber and Decorator.*

The Metal Worker produces in this volume a number of queries, with answers thereto, which have appeared in that paper. It will be seen that *any plumber who is troubled to make boilers work satisfactorily will here find his troubles alleviated. It contains numerous illustrations and throughout is highly practical from the standpoint of the plumber.* It contains a table of contents and an index.—*Scientific American.*

The publisher of this work is well known for his former successful efforts in the publication of useful and thoroughly practical books for metal workers and steam fitters The book before us is a model of its kind in judicious compilation, practical instruction, neat illustrations and general typographical appearance.—*The Master Steam Fitter.*

Can be considered an authority on the subject to which it relates.—*American Engineering.*

The book is a practical helper to every member of the plumbing trade, who, being alive to his own interests, should embrace this opportunity to obtain the valuable instruction in which the work abounds.—*New England Stove, Hardware and House Furnisher.*

A well bound, well printed, well illustrated and well edited book. . . The special field of this work is very thoroughly covered. . . Abounding in rare technical information of a practical character. *American Artisan.*

Nearly every problem is illustrated fully and this interesting question of water back connections will be found to be quite fully treated in the volume.—*Domestic Engineering.*

Both interesting and instructive to our trade. It shows how mistakes are apt to arise and how they may be overcome —*Plumbers' Trade Journal.*

Sent, post-paid, on receipt of price by

DAVID WILLIAMS, Publisher,

96-102 Reade Street, NEW YORK

THE METAL WORKER ESSAYS

—ON—

HOUSE HEATING

—BY—

STEAM, HOT WATER AND HOT AIR

With Introduction and Tabular Comparisons.

Second edition, revised. To which has been added a selection from the Letters of Criticism on the Essays as originally published in THE METAL WORKER and a chapter on Proportioning Radiating Surfaces.

"The various subjects treated on are indicated by marginal sub-headings for reference purposes, and the illustrations, computations, &c., are plain and easy of understanding. The book may truthfully be said to be a careful compilation of the best ideas of those best qualified to speak on the subjects treated of, and to form as a whole the very latest and most valuable literature on a topic which is becoming more and more recognized as being of the first importance in the building and furnishing of healthful homes."—*The Building Trades Journal.*

"It constitutes one of the most valuable works on the subject of house heating hitherto published. It is a terse compendium of practical knowledge of all that is most useful on the subject, wholly ignoring an enormous amount of useless speculation upon the subject comprised in numerous volumes and the current literature of the day—written by persons who adopt theories and vainly search for facts to sustain them—not worth the reading. *Per contra*, the work before us is alike commendable to major-domos who would be well informed on the subject, and to engineers of heating and ventilation, who cannot afford to do without it."—*The Sanatarian.*

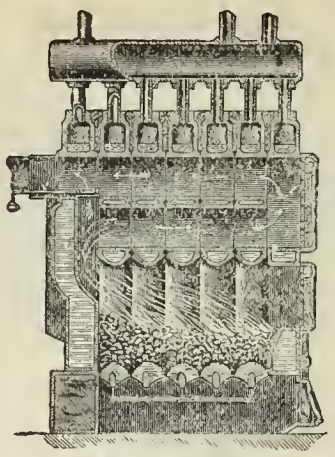
"There are fifteen essays in all, and every one of them is well worth the careful consideration of those interested in this most important subject. . . . The work is undoubtedly one of the most practical and highly valuable ever given to the public on the subject of house heating, and so thoroughly contrasts the different systems considered as to leave the subject almost, if not completely, exhausted. We commend it to the kindly consideration of all of our readers who desire the most practical views on the subject of which it treats."—*The Age of Steel.*

"Practical men have contributed of their knowledge in such a way and in such a form as to make the subject interesting as well as highly instructive, and with copious tables and diagrams showing the various methods of piping, etc., the work is unlike any book published. The book treats the subject in a common-sense method and goes directly to the point without any theorizing. It is a valued work and worth the money it costs many times over. It should be read by all devotees of the systems advocated in its pages, as it deals with a subject that is becoming more and more important every year and one that demands the best thought and the highest skill of every workman."—*Register and Bulletin.*

"It is a practical book. It does not contain rules that depend for their integrity upon one set of conditions, and which may not suit any other condition. The book is for the student, and when studied it will be found surprising how much information it contains that may not appear by a superficial glance or hasty examination."—*Boston Journal of Commerce.*

The work is handsomely presented in a volume of 288 pages in the form of a handy reference book, with many illustrations, showing the several ideas and methods of heating, ventilation and economical arrangement of pipes and radiators, &c. The very complete specifications of materials which accompany several of the essays give a value to the work that will be understood and appreciated by the architect and builder who aim for excellence in this branch of house building."—*The National Builder.*

JAMES SQUIRE, *Youngstown, Ohio.*—"If we had only had the information contained in this volume in earlier life, we could now have dollars where we only have buttons."



407 pages, 7 x 9½ inches. Handsomely bound in cloth. One volume.

PRICE, $3.00.

Sent post-paid on receipt of price by

IS THE BEST.

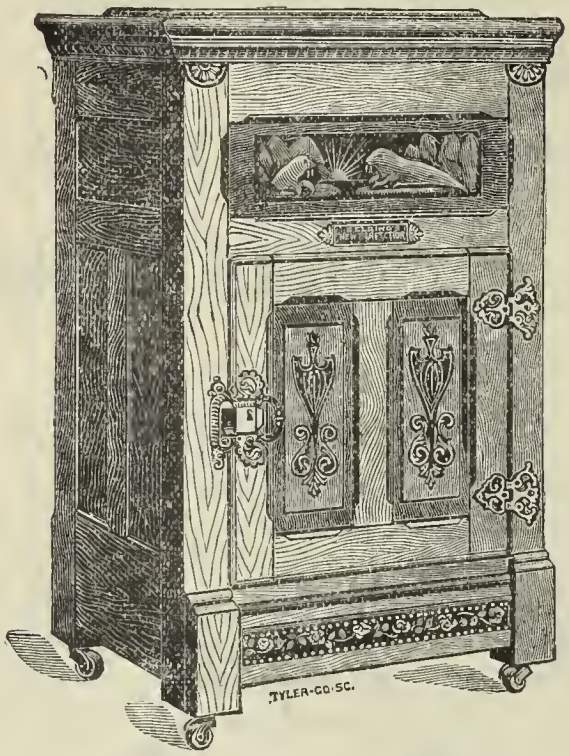
The F. E. BELDEN MICA MINING CO.,

12 Broad St., Boston, Mass.

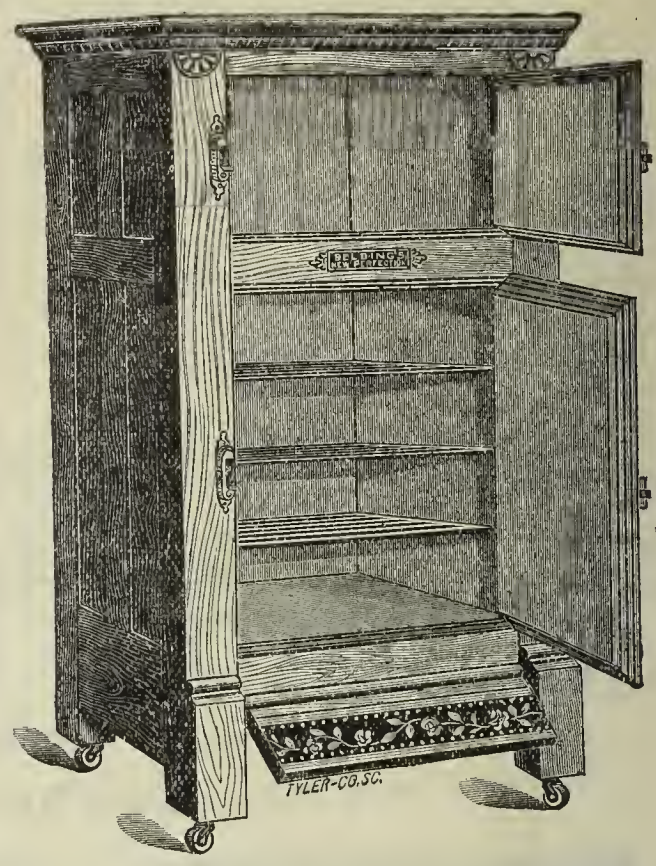
Quartz Fibers.

The finest fibers said to have been ever made have been spun, says an exchange, by Professor Boys, out of quartz. This highly refractory substance, which requires to melt it a temperature greater than that developed in any furnace, when softened by the intense heat of the oxyhydrogen blow pipe, may be drawn out into threads of incredible fineness. Professor Boys manipulates it by using a cross-bow arrangement, by which a straw, used as an arrow, carrying a small bit of quartz rod, is joined to another rod of quartz by melting the point of contact. When the straw arrow is fired from the cross bow it draws out the quartz into a thread, which may be made of almost any desired thickness, of any uniform diameter, and remarkably strong, considering the fineness. Fibers 1 15,000 inch in diameter have been made, 100 of which only equal in size the thickness of a single silkworm's thread, and the ends as they are drawn out become so fine that they cannot be seen, even with the aid of the most powerful microscope, and are not thicker than 1-1,000,000 inch. A single cubic inch of quartz would supply sufficient thread to go around the world no fewer than 658 times—in other words, the length would be 16,450,000 miles.

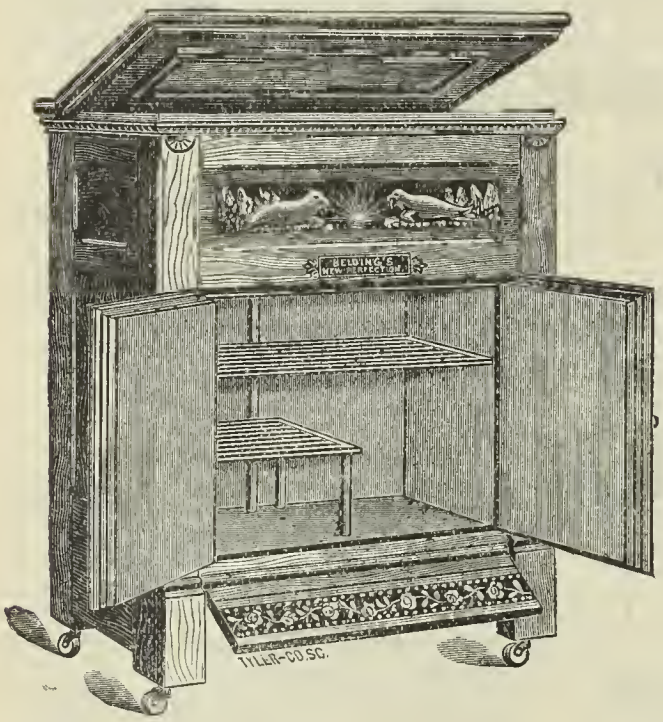
— A Difficult Task.—"So you are a mind reader, are you?" said a very smart young man to an adept at that species of mystery.



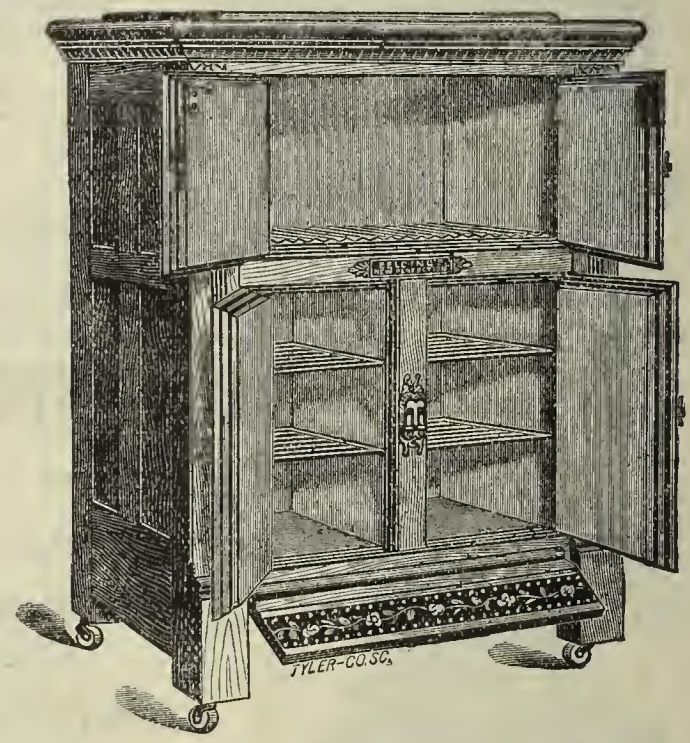
"Yes."



"Indeed! Then read mine."

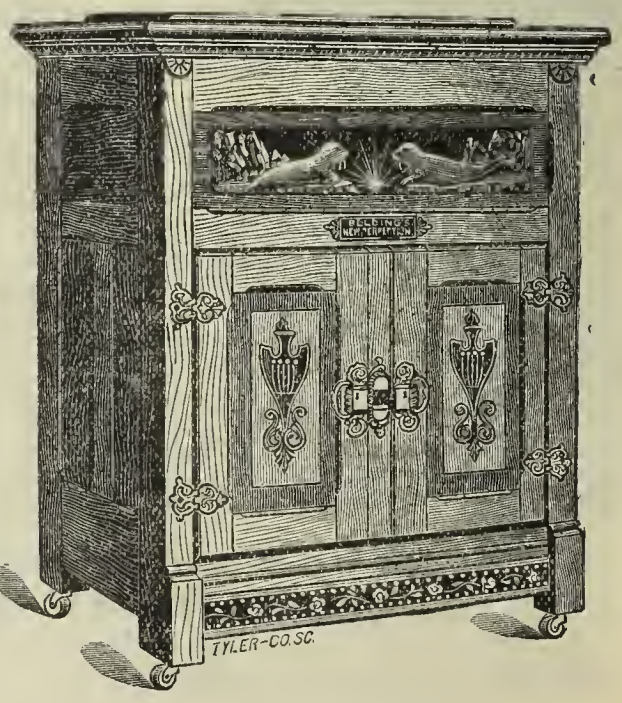


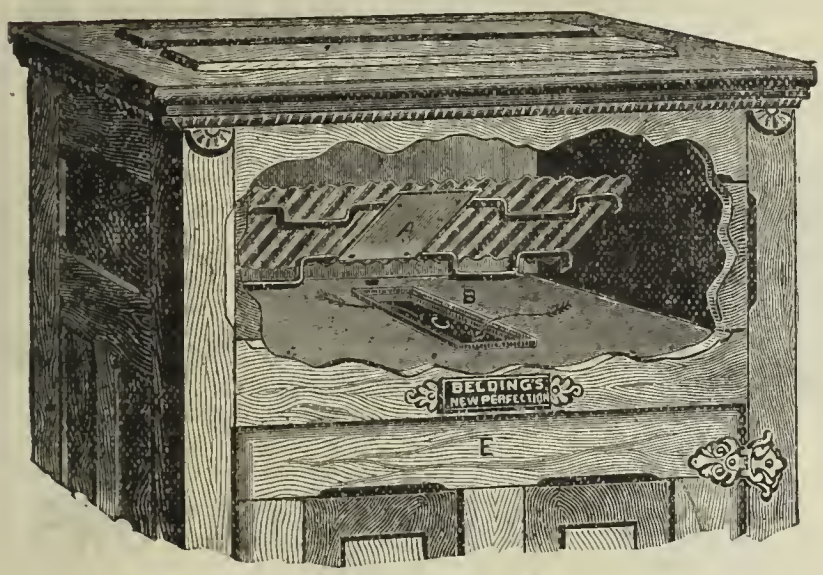
"Why didn't you bring it with you?"

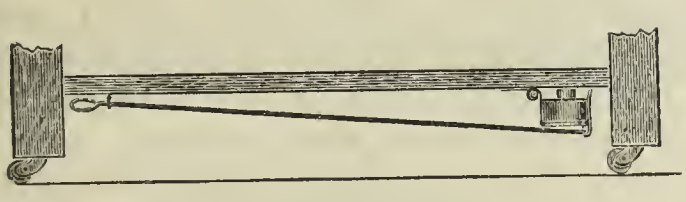


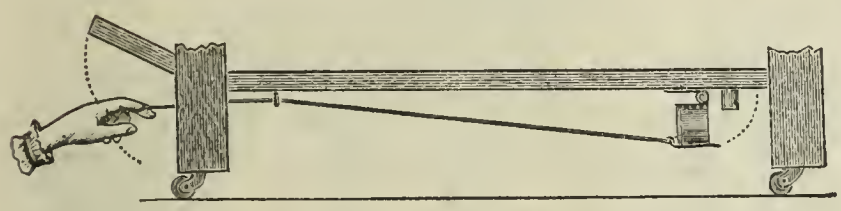
—*Exchange.*

BELDING'S REFRIGERATORS.





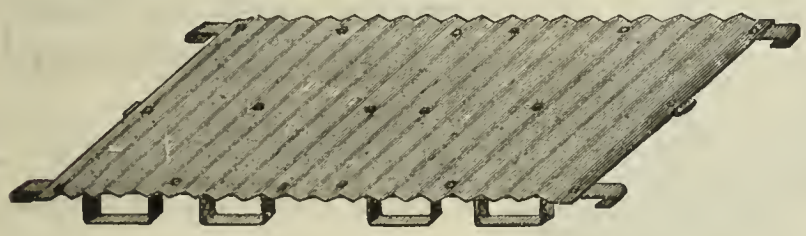




See Points of Excellence Over Others.

Patent Applied For.

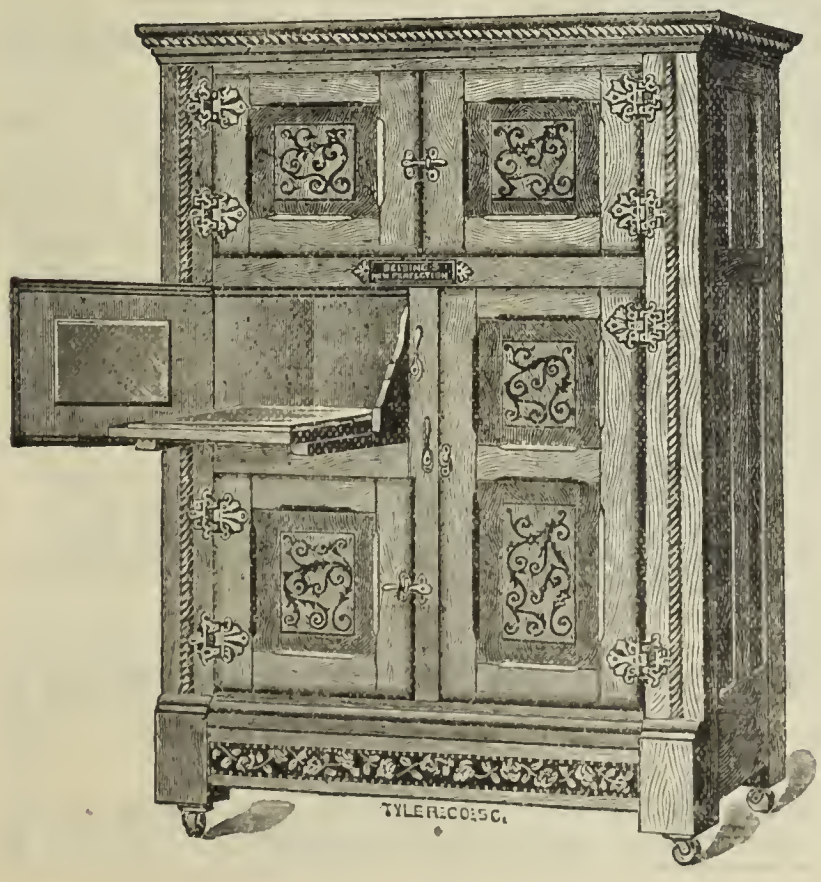
OUR NEW AUTOMATIC COLD AIR DAMPER ATTACHMENTS.



This cut shows a section of our Refrigerator with the New Automatic Cold Air Damper closed.

A—Represents Metal Ice Rack.
B—Bottom of Ice Compartment.
D—The **New Automatic Cold Air Damper.**
E—Door of Provision Chamber.

When the door of the Provision Chamber is opened the Cold Air Damper *immediately* closes the opening through which the cold air drops, thereby *instantly stopping the circulation* in the Refrigerator. Then, as the cold air in the Ice Compartment *cannot escape*, it is impossible for warm air to enter it through the flues in the sides of the Refrigerator; therefore, while the door of the Provision Chamber is open *no ice is wasted, no cold air escapes* and *no warm air enters* the Ice Compartment or *comes in contact with the ice.*



Thus it is clearly shown that this improvement is a *practical* one and makes our Refrigerators *consume less ice* than any that are now on the market.

OUR NEW DRIP CUP ATTACHMENT.

SOLID METAL ICE RACK.

No wood cleats to get water soaked and tainted.

All refrigerators **hardwood, antique finish.** We carry large stocks at all of the following places:

Hobbies.

There are hobbies and hobbies, hobbies useless and hobbies profitable, hobbies which are futile and trsnsient and hobbies which are of perennlal interest. But the value of a rational hobby to a busy man can hardly be overestlmated. To have some pursuit to care about and follow up, distinct from the particular business which constitutes the main work of his days, has a decided tendency for good on the well being not only of the young, but of the old. It fills up the spare moments of the boy or young man, keeps him from temptations out of doors and gives him something to thlnk and occupy himself about indoors. It keeps his mind from preying on itself and tends to broaden his character and his sympathies.

Their Good Influence.

The adoption of a hobby in early life, be it artistic, mechanical, llterary, sclentific, social or merely commonplace, leads more than often to pleasant intercourse and the companionship of kindred spirits to which the young man might not otherwise be able to attain. Possibly lt may afford an avenue to influencc or fame in after life, or, still better, it may open the door of opportunlty to minister profit or pleasure to others, making the man a blessing to his fellows, even to old age. Hobbies have helped many an old man to enjoy life snd keep his interest and intelligence keen to the end of his days. The man who has no special interest outside his daily business tasks is, as a rule, laying up for himself a miserable old age. It is pitiable to see how some men become completely absorbed in the business of money getting. Gradually their business absorbs more and more of their thoughts until at last they can think of or care for nothing else. Their minds narrow down to one groove, out of which they cannot escape. Then, when sickness or other cause cuts them off from active participation therein, they are bankrupt of interests, are lncapable of adopting new pursuits, and become a misery to themselves and all around them. Much of this mlght be avoided by the cultivation of a profitable hobby in early life.

News and Notes.

The powerful Britlsh battle ship "Msjestic" was launched at Portsmouth, England, on January 31. The "Majestic" is a twin ship with the "Magnificent," which was launched at Chatham on December 19. They are described as first-class barbette battle ships of 14,900 tons displacement; and are the largest British war vessels afloat. The "Majestic" was launched in the short space of 14 months from the date her keel was laid.

The difference between a practical man in an executive municipal office and the series of mere politicians who have preceded him is exemplified in the case of Colonel Waring, the well-known sanitary engineer, who has recently assumed the post of Street Cleaning Commissioner of New York City. Since his advent the city streets have been kept clean despite extremely trying conditions of weather, the snow being removed promptly instead of being suffered to lie untouched for days, as has been previously the case.

It has been found necessary to place additional steel girders in various portions of the new Public Buildings of Philadelphia in order to strengthen them.

The federation of all the Australian colonies was approved at a special conference of colonial government representatives held last week at Hobart Town, Tasmania.

Work has been commenced on the foundation of the new plate bending shop at the Brooklyn Navy Yard. The building, for which Congress appropriated $70,000, will be 200 feet long by 85 feet in width and will be constructed of steel.

The United States Minister at Madrid has cabled the State Department that the bill embodying the *modus vivendi* for restoring the former rates on United States exports to Cuba and Porto Rico has passed the Spanish Senate. The *modus vivendi* will operate until a definitive treaty on the subject is executed between the two countries.

A new locomotive apparatus for the purpose of liquefying snow and ice was tried with apparent success in New York City a few days ago. The machine is self propelling and weighs 8500 pounds. It converts the snow into water, which is immediately turned, after the manner of a sprinkling machine, into the gutters wlth sufficient force to carry it into the sewer openings.

A committee of nine prominent citizens has been nominated by Mayor McKenna of Pittsburgh to investigate the improvements most needed in that city, and it is proposed to issue $5,000,000 worth of bonds to carry out these improvements.

The plate glass manufacturers of the United States are said to be about to form a new combination, avoiding anything in the nature of a trust. The capital stock will be about $10,000,000.

The statement of mill construction in the United States for 1894, given by the *Textile World*, indicates a material falling off in this field of industry. Along with a serious decrease in cotton mill building, however, there is stated to have been considerable enlargement of existing plants. The new spinning mills projected for this year are, moreover, decidedly more numerous than those planned at the beginning of 1894. On the other hand, of textile mill constructlon in general, the impression is conveyed that an increase in new construction is not expected for the coming year. The statement of new textile mills constructed and spindles added in each of the last three years is as follows:

	1894.	1893.	1892.
Cotton.....	23	52	73
Woolen.....	17	33	49
Knitting.....	40	53	49
Silk.....	11	15	21
Miscellaneous.....	23	19	36
New spindles added..	422,000	600,000	1,100,000

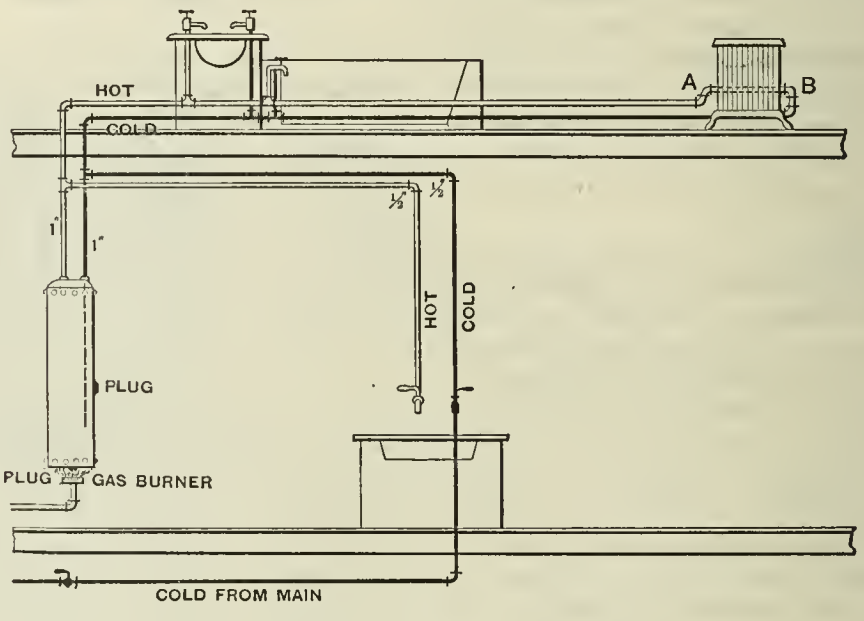
The January Treasury statement shows a phenomenal loss of $41,500,000 in the Government gold reserve during the first month of the year. At this rate the reserve would be obliterated by the beginning of March.

The presldent of the Amalgamated Iron and Steel Workers' Association of Pittsburgh has reported to the Treasury Department that he has reason to believe that tin workers from Wales and elsewhere are preparing to come to this country under contract to take the place of American workmen who are reslsting a proposed reduction in their wages.

Arrangements have been completed this week for the starting of a line of steamers to run from Portland, Ore., to China and Japan, in connection with the Oregon Railway & Navigation Company. The Great Northern is said to have a share in the scheme.

The State Gas Inspector of Indiana, whose office the Legislature has decided to abolish, has made public the statement that Indiana's natural gas supply, at its present rate of consumption, will be exhausted in four years.

THE LETTER BOX.



Driven Wells.

From F. R , *Ohio.*—Please advise me whether drive wells are used in Canada and England to any extent. Also about how far it is to water, as a rule, and to what soils the wells are adapted ?

Answer. — Drive wells are used in Canada and England to a large extent. Since its first introduction for private water supply following its invention and use for military water supply by Colonel Green of the Seventy-sixth New York Regiment during the Civil War in 1861, the system of driven wells has spread almost into universal use. It was adopted as a military resource by the British army in its expedition to Abyssinia (1867), and was named in England "The Abyssinian pump," and was also carried into Algiers by the French army of occupation. As an adjunct to a moving army in an enemy's country the system at once became a permanent safeguard for the supply of pure and wholesome water, free from the perils of pollution by an enemy, and, in fact, is no less a safeguard for every one dependent upon an open well as against accidental or intentional pollution. From its military publicity its use spread to a large extent in England and her dependencies, to the Continent and we may say throughout the civilized world, to India and even now to the wilds of Ashantee, as a part of the French army commissary. In fact there is scarcely a recognized nation among whom this system of obtaining water is not known. It is estimated that the number of driven wells furnishing fresh and wholesome water in the United States has reached the 1,000,000 mark. Any soil that a pointed pipe can be driven into and that contains a water stratum within 30 feet from the surface is suitable for driving a well tube for a common pump connection. Where the water stratum is at a greater depth, up to, say, 40 feet, a well pit to allow of placing the pump chamber and bucket down to the water drawing distance is in order. For greater depths the deep driven well system of the American Well Works, Aurora, Ill., and the Cook Well Company of Chicago and St. Louis, are types of the best method for economical water supply from deep driven wells. The only difficulty in driving well tubes is found in the boulder drift, where large boulders sometimes obstruct the way, which should only cause a loss of time in drawing the tube and driving again in a nearby place. In some instances this has been done several times with, possibly, the loss of a tube before a successful well is obtained. Not only is the drive well used for a new water supply, but it may be used to great advantage for the reinforcement of old wells that lose their water in dry seasons, as described and illustrated in *The Metal Worker* of July 21, 1894. The gang system of driven wells, consisting of a number of pipes driven in lines at distances of from 25 to 50 feet apart, and all connected to a suction line pipe and to a pump, has become one of the leading features of the present water supply for cities and villages in the United States and other countries.

A Faulty Arrangement of Piping.

From J. H. D., *Richmond, Ind.*—I would be pleased to have *The Metal Worker* give me some assistance in a matter which is causing me considerable trouble. I have a plumbing job which at times runs warm water from both the hot and cold faucets. I have had another plumber look the job over who points out several defects, and I have been advised by him to consult *The Metal Worker* for a remedy. The sketch shown herewith indicates the arrangement. Both of the faucets at the washstand give hot water at the same time, although sometimes one is hot and one cold, and the faucets at the bathtub act in the same way. The radiator has no valve to shut off the circulation through it, yet it never gets more than lukewarm. There are only two pipes going to the bathroom and they both leave the top of the boiler in the kitchen. No means have been provided for emptying the boiler, a plug being placed in both the bottom and side connection, as the boiler is heated by a natural gas burner placed beneath it. The water in the boiler seems to get thoroughly hot.

A Faulty Arrangement of Piping.

Note.—Some of our readers may have suggestions to offer for changing the piping of this job. It is a simple matter to provide means for emptying the boiler. The plug can be taken out from the bottom of the boiler and a pipe run from it to the trap under the sink, having a stop cock placed near the boiler to prevent the water wasting. The trouble at the faucets is caused by what ordinarily would be a cold water service pipe being used as a return pipe from the radiator. The hot water that flows from the cold water faucets is forced to do so by the cold water stopping the circulation in the heating system and driving all the hot water out of the faucet when opened—that is, in the pipe between where the supply pipe connects with the return and the faucet. This can be overcome by using a separate return pipe from the radiator and carrying it down and connecting it at the side of the boiler where the plug has been placed. This will make the cold water service entirely independent of the hot water to the faucet and the heating system. The failure of the radiator to heat may be due to the size of the pipe leading to it. This pipe should be continued 1 inch in size all the way to the radiator, and the return pipe should be 1 inch all the way back to the boiler.

Size of a Gallon.

From J. E. K., *New York.*—Please inform me through *The Metal Worker* what is the size of a gallon of water, and what it weighs per cubic foot? I have had an argument with a friend and told him there are about 7½ gallons of water in a cubic foot and that the

weight was about 56 pounds. He said there were 6¼ gallons and the weight was 62 pounds. Please tell me which was right.

Answer.—Our correspondent will be surprised if we tell him that both of the statements are right—that is, the United States gallon contains 231 cubic inches, and accordingly there are 7½ or, exactly speaking, $7\frac{1}{2}\frac{1}{3}\frac{1}{1}$ gallons to the cubic foot. The imperial gallon, which is the old standard and the one used in Great Britain, contains 277.274 cubic inches, and, therefore, a cubic foot is equal to 6.23 imperial gallons. We do not quite understand our correspondent's reference to weights. The weight of a cubic foot of water is about 62⅜ pounds—that is, it varies from 62.417 pounds at 32° F. to 59.7 pounds at 212° F. A gallon according to this would weigh a little over 8 pounds.

Rusting of Gutter Outlets.

From E. F. B., *Greenville, Pa.*—I would like to be informed through the columns of *The Metal Worker* why the tubes soldered on hanging gutters rust out before the conductor. Is there any remedy?

Answer.—The outlet tube, which is soldered to the under side of a hanging gutter, is usually made tapering, so as to slide into the connecting elbow or pipe some distance. As the tube is tapering, it may be possible for water to be held by capillary attraction between the two, and thus cause the tube, and perhaps the connecting part of the elbow, to rust. If this be the cause, the use of well coated heavy tin for the outlet and connecting joint would be an advantage. If any of our readers have encountered this difficulty they are requested to give their opinions on the subject.

Insufficient Air Supply.

From G. & W., *Elkhart, Ind.*—Noticing the letter of "A.H." of Milwaukee in *The Metal Worker* of December 15, on an insufficient air supply, I was much interested, as I have a similar problem. One furnace among a half dozen which we have set just like the one reported, with a single exception, acts in a similar way. The furnace is of ample size, two 8 inch pipes connecting with 3½ x 10 inch stacks leading to the second floor. One 8 inch and four 9 inch pipes lead to registers in the floors for heating the first floor. The furnace sets over a pit, with a cold air trench 12 x 24 inches in size leading to it. My carpenter, in connecting the wooden box from the window to the trench, incressed the size at the lower end so that it is 12 x 30 inches. I do not know whether this is the csuse of the furnace becoming excessively hot or not. The cold air window opens to the north and the furnace faces to the south, and the pit beneath the furnace is 30 inches in diameter. The furnace does not furnish enough heat upstairs for the amount of coal consumed. I have a 9-inch return pipe from the first floor to the base of the furnace, taken in through the casing. The hot air pipes, with one exception, lead to the southwest, east and northeast, one 8-inch pipe only running to the northwest. If you can give me any information on this subject it will be esteemed a favor. It seems to me that in the case of "A. H." his 10 x 12 inch pipes are larger than necessary, and surely the 5 x 13 inch stacks are too large for the cellar connections to them.

Answer.—In figuring up the area of the hot air outlets we find that they amount to 402 square inches, while the area of the cold air supply amounts to 268 inches, which is less than it should be. It is a common practice, as winter draws nigh, to see that all windows and doors are tightly closed, which prevents the escape of air which is already in the room, and prevents the entrance of the hot air which must come in to heat the rooms comfortably. If the doors all through the house were open, the 9-inch return pipe might be of some assistance in heating the house, but the trouble seems to be that the cold air tube is too small to properly supply the pipes, and there is not sufficient outlet for the air that is already in the house to escape and make room for the warm air to enter to heat the building.

Estimating Labor in Pipe Fitting Contracts.

From E. S., *Cincinnati, Ohio.*—Will *The Metal Worker* please inform me how time or labor on a steam or hot water heating plant is estimated? The principal information I want is the number of feet of pipe a man is supposed to lay in a day of ten hours.

Note.—This is a question that we would be pleased to have the readers of *The Metal Worker* discuss at some length. Some of the old rules that applied to laying gas pipe were adapted to piping heating plants in the early days of the business, and some rules existed in reference to the running of cast iron pipes when all the joints were made by rusting. But these are not applicable to the work as now done. A common rule is to estimate the time required by the number of radiators used. On small heating plants, where there are from six to eight radiators used in connection with the boiler, it has been usual to calculate from one and a half to two days' work for a pipe fitter and helper for each radiator in hot water work. Steam work is done sometimes on the one-pipe system, sometimes on the two-pipe system, and the labor required ranges from one to one and a half days to a radiator connection. On larger jobs, where 20 or more radiators are used, the time is materially shortened, so that hot water work may be reduced to one and a half days and steam work to one day, or even less. This method of calculation does not consider the possibilities of having to make special runs around obstructing girders or other constructive peculiarities of the building or cutting through walls.

Chimney Sweats.

From F. W. H., *Lafayette, Ind.*—Will *The Metal Worker* please describe a remedy for a chimney that sweats so badly that the condensation runs down the wall and looks like tar on the ceiling of the room? On the outside the chimney is wet and fairly steams. The chimney is in a two-story brick house, having a furnace which is connected to it by means of a smoke pipe and uses natural gas as a fuel. The chimney is in the north wall of the building. I have cut a hole in the wall of the chimney near the top of the second story with no beneficial results.

Note.—As the dimensions of the chimney are not given it is difficult to state what causes the trouble. It is certain, however, that cutting a hole in the chimney was a step in the wrong direction, and if the chimney steams on the outside it is fair to suppose that the chimney is not air tight, which it must be to be satisfactory in operation. Gas apparatus does not require so large a chimney, as a rule, as coal apparatus, and it is fair to suppose that the products of combustion condense before escaping from the chimney and cause the trouble reported. It is more than likely that the chimney has been used for other fuel in the past, and the condensation is colored by the refuse from the previous fuels. It is quite probable that better success can be secured with the apparatus and the trouble avoided by running a pipe inside the chimney clear to the top, and if the pipe is put together in the reverse of the usual way condensation will run down inside of the pipe to the bottom.

Barker's Chimney Top Ventilator.

From H. W. M., *Wadsworth, Ohio.*—Please inform me if there is a patent on the chimney top made like the sketch inclosed? The top is described as a sure cure for low smoky chimneys.

Answer.—The sketch in our correspondent's letter shows Barker's chimney top ventilator, which was patented October 27, 1879. G. E. Barker, St. Lawrence, S. Dak., and H. W. Barker, 7820 Wallace street, Chicago, issue licenses to manufacture under royalty.

The water supply of the city of Brooklyn has of late been of such poor quality that the citizens were not surprised when Health Commissioner Emery issued a formal notice to the householders that the water, as it enters their houses, is unfit for potable purposes, and must be thoroughly boiled before use. Analysis of the water showed it to be largely impregnated with vegetable matter and mud sediment. It is believed that the recent storms have affected the supply, the melting snow carrying deleterious substances with it into the ponds from which the supply is drawn. In many cases the pipes have become clogged, and an eel was found a day or two ago in a water pipe in the Twenty-third ward of the city.

The city government of Camden, N. J., have contracted with the Dixon Crematory Company of Findlay, Ohio, for the erection of a garbage crematory at a cost of $10,000.

ROOFING AND CORNICE.

The Evolution of an Old Building.

The adaptability of sheet metal for architectural purposes has been demonstrated during the past 15 years by the extent of its adoption. Numbers of new buildings in all parts of the country have exteriors composed entirely of sheet metal. Old and dilapidated structures of wood or brick, too, may be modernized and improved by the use of sheet metal applied in the form of plates, and in this direction a practically unlimited field is open to the metal worker. The manufacture of sheet metal plates in iron steel and copper for architectural purposes has already become an important industry, and manufacturers have brought their productions to such a state of perfection that material of all kinds is now so closely imitated in metal as to make actual examination necessary to discover the substitution. The endurance of the plates has been severely tested, and has proved to be such as to warrant their use in any and all climates, and they have been adopted in many cases in preference to stone or brick as successfully withstanding climatic and atmospheric influences.

To give an idea of their usefulness in the renovation of old buildings, we present a series of illustrations showing the different stages in the evolution of an old building to one embodying modern ideas of architecture. Fig. 1 is a view of an old three-story brick building recently purchased by Gara, McGinley & Co., Philadelphia, and known as 23 South Seventeenth street, in that city. The firm mentioned have been identified with the growth of the architectural branch of the sheet metal industry for many years, and they conceived the idea of transforming the old building into one of modern appearance in order to practically demonstrate their abilities in this direction. Fig. 2 shows the windows removed and the side doors bricked up. The window openings are not enlarged, and beyond the bricking up of the doors no change in the appearance of the building is noticeable. In Fig. 3 it will be seen that the third story was obtained by squaring the peak of the house. The work was rough, no pointing or finishing being required, and the bricks were taken from an old wall at the rear of the house. Fig. 4 shows the method of putting on the metal plates. The bricks are first plugged, that is, wooden plugs are driven into the mortar for use as supports or nailing surfaces for the wooden strips to which the plates are attached. The window arches are formed on the wide strips seen above the old windows. The upper story has been treated with a coating of red lead preparatory to painting. Fig. 5 shows the finished building. The walls

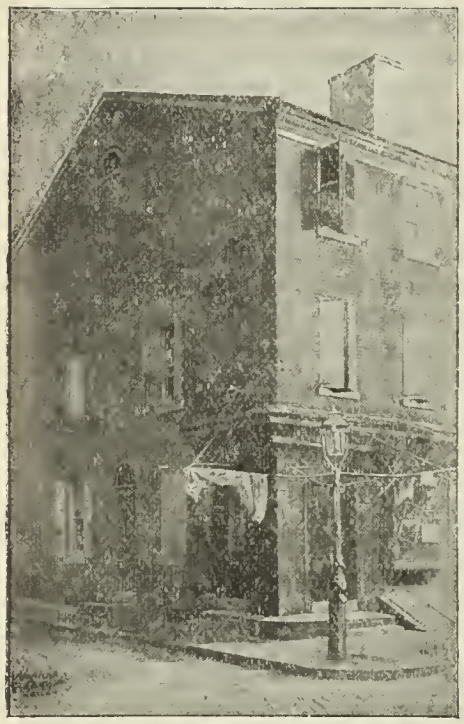


Fig. 1.—View of Old Building.

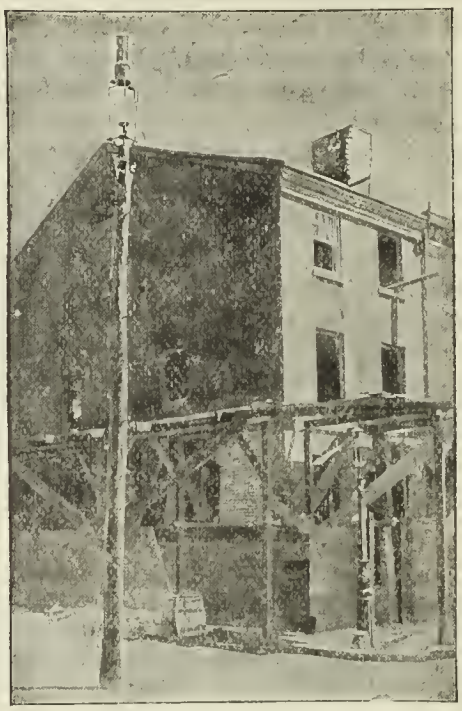

Fig. 2.—Windows Removed and Doors Bricked Up.

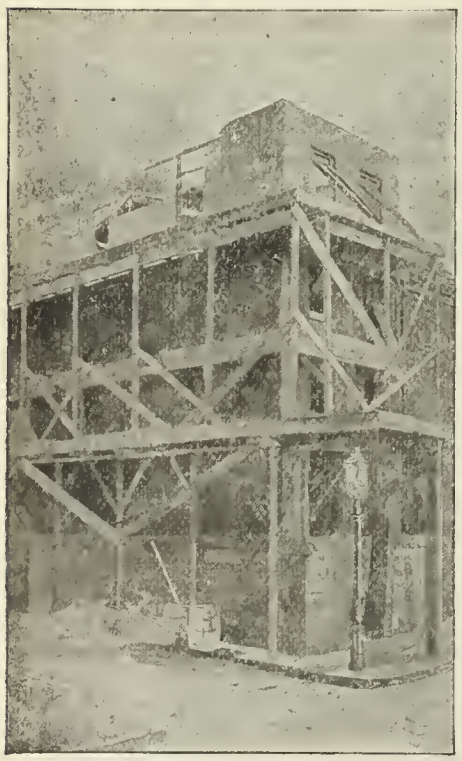

Fig. 3.—Completing the Third Story.

Fig. 4.—Putting on the Metal Plates.

Fig. 5.—Finished Building.

of the two upper stories are covered with rock faced siding plates; those of the second story from the top to the lower part of the arches with tiling plates, and the remainder with pick faced plates. The upper story is painted to represent Indiana limestone, and the lower stories represent red sandstone.

FLASHINGS.

"GALVANIZED IRON CUSHION" is the curious but unexplained title of a little pamphlet that reaches us from the Apollo Iron & Steel Company, Pittsburgh, Pa. It is a remarkably neat little publication, with merely the three words mentioned on the front cover. On looking within it is discovered what the phrase refers to. It is a cushion which is placed between the sharp end of the band and the sheet of galvanized iron, acting as a washer and preventing the top sheet from being injured. Illustrations of the cushion are shown, and the pamphlet further goes on to tell of the advantages of the Apollo iron.

GEO. A. OHL & Co , Newark, N. J., have recently completed and shipped to the Kinnear & Gager Company, Columbus, Ohio, a new machine for decorating sheet metal by indentation. By varying the pressure widely different effects can be gained in the appearance. The machine will work sheet metal up to 36 inches wide, and the process of decoration is completed in one operation instead of several, as formerly.

G. MOSER & SONS have moved into their new offices on the fourth floor at 225 West Second street, Cincinnati, Ohio, their increase of business having compelled them to enlarge their press rooms, which now take in all of the fifth floor of the building. Among extensive contracts that the company have recently completed was one for $1000 worth of dies for the Metallic Cabinet Company of 92 Elm street, Cincinnati, for the manufacture of metallic furniture. Messrs. Moser & Sons do a large export trade, having within the past few weeks received three direct orders from Australia for tin tags, and have secured a contract from a large firm in St. Louis for supplying their entire requirements for 1895, which will amount to about 150,000,000 tags.

THE LUFKIN RULE COMPANY, Saginaw, Mich., have announced a considerable reduction in the price of their Magic pattern rule. a device patented five years ago, and which has had a very extensive sale. The rule consists of a bar marked in circumference inches on the front, and in inches and eighths on the back, and two slides, with set screws, into which trammel points are fastened. For laying out elbow patterns the left hand slide is fastened to the end of the bar by the set screw, and the right hand slide is set according to the diameter of the elbow desired. A flexible steel ribbon on the top of the bar is then raised to the required hight, according to the angle of elbow wanted, this hight being read from a chart furnished by the Lufkin Rule Company. The chart is 19 x 23 inches in size, mounted on linen, and contains besides the elbow diagram, rules for cutting all kinds of flaring, oval, cylindrical, cone shaped vessels, &c., with the aid of the Magic pattern rule. The rule can also be used for a straightedge, circumference rule and trammel.

THE FIRM of Welteroth & Brand, Williamsport, Pa., have been dissolved, the business to be continued hereafter by Joseph Welteroth.

HEATING AND PLUMBING.

NEW WORK AND CONTRACTS.

H. A. R. DIETRICH, Bethlehem, Pa., the steam heating and hot water contractor, has completed the steam heating plant in the Municipal Building. The second boiler was put in recently.

J. J. HOGAN, New Haven, Conn., is overhauling the plumbing in Thos. Kelly's building, putting in new fixtures.

THE SCHOOL BOARD of Springfield, Ohio, is advertising for bids for heating the Lagonda Building.

AT A MEETING of the Board of School Government last week B. G. Carpenter & Co., Wilkes-Barre, Pa., were awarded the contract for heating the new Grant Street School Building for $2750.

HULETT & HAY of Racine, Wis., have been awarded the contract for putting the steam heating plant in the Racine Court House at $1788.

A NEW HEATING APPARATUS is being put in the Union School Building, at Cooperstown, N. Y. J. Yates of Schenectady is supervising the work.

E. W. BECK & Co., Derby, Conn., have the contract for heating the Congregational Church at Shelton.

THE New Haven *Record* says : J. A. Campbell & Co., New Haven, Conn., have the contract for the plumbing for a two-family house for T. Coyle.

THE COMMISSIONERS OF PUBLIC WORKS, Milwaukee, Wis , are advertising for plans for a $12,000 school building that is to have a plumbing, lighting and heating system.

THE THOMPSON MFG. COMPANY of Lancaster, N. H., are putting in a steam heating plant for Pattee & Clark.

M. J. KIBBE, New Britain, Conn., has the contract to do the plumbing and gas fitting in the new house of W. H. Cadwell.

THE ATTAWANGAN HOUSE at Danielsonville, Conn., is to be remodeled and to have a steam heating plant.

AN APPROPRIATION of $2000 has been made for heating and making some other improvements in the County Children's Home at Norwalk, Conn.

THE ARNOLD COMPANY, New Haven, Conn., are plumbing the new Borges flats on State street, each flat having bath tub, lavatory and water closet, Peck Bros. & Co.'s fixtures being used.

THE FOSKETT & BISHOP COMPANY, New Haven, Conn., have been awarded the contract for plumbing the new Winchester Building on Orange street. The Durham system will be used, with Meyer-Sniffen fixtures. There will be 22 water closets, 29 basins and 11 urinals, the contract price being between $7000 and $8000.

THE EXETER MACHINE WORKS, Boston, Mass., are furnishing one 24-section Exeter boiler and a carload of Exeter radiators for the Armsby Block, Worcester, Codding & Taft, Worcester, being the contractors. Among other orders is one for a 16 section Exeter boiler and a carload of Exeter radiators for the E. W. Miles Block, Brookline, Mass., where Kenrick Brothers are doing the work. They are likewise furnishing a 12-section boiler with radiators for the George P. Staples & Co. Block, Washington street, Boston.

THE POWERS REGULATOR COMPANY, 36 Dearborn street, Chicago, are to place their automatic heat regulators in four of the city school buildings.

THE L H. PRENTICE COMPANY, 203–205 Van Buren street, Chicago, are to furnish the Reliance Building, State and Washington streets, with the Paul system of circulating exhaust steam without back pressure.

THE J. L. MOTT IRON WORKS, 311–313 Wabash avenue, Chicago, are to furnish 14 No. 4 and 1 No. 5 Sunray hot water boilers for the stations of the Metropolitan Elevated Railroad. This order, in connection with one previously received, makes 31 Sunray heaters that are to be used in the stations.

THE FULLER & WARREN COMPANY, 147–149 Lake street, Chicago, have contracts for warm air heating in the following residences ; Frank Wessman, 171 Baxter street ; F. G. Maher, 5112 Union avenue, two furnaces; E. Garrison, Rogers Park; M. L. Greely, Winnetka.

DONNELLY & BURKE, 187 Columbus avenue, New York, are doing the plumbing in three flat houses for Edward Kilpatrick.

HARDWICKE & Co., Niagara Falls, N. Y., have just closed a contract with the State authorities for the heating of the new armory of the Hornellsville Separate Company.

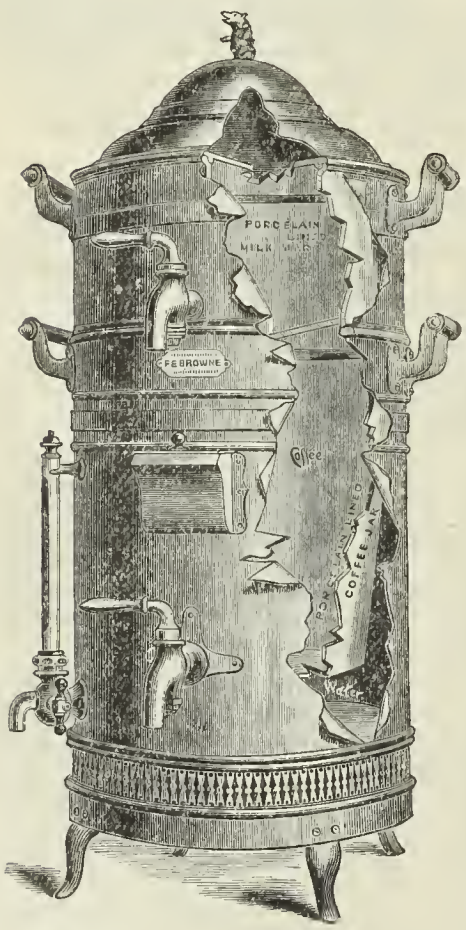
GLINES & KEELER, Hudson, Mass., have received from the William H. Page Boiler Company three sectional boilers, which they are to put into the blocks of C. L. Woodbury Sons, E. P. Lawrence and C. W. Holden of Hudson.

HILLS & FOX, Hartford, Conn., have the contract for the plumbing and gas fitting in one of the new fire engine houses at Hartford, Conn. The contract for the same work in the other house has not yet been let.

GEO. L. ROOD, 79 Lake street, Chicago, is to place a Prince Royal warm air furnace in the residence of E. F. Wilbur, Winnetka, Ill.

D. S. RICHARDSON, representing the New York Central Iron Works, Geneva, N. Y., presented the delegates to the plumbers' convention, at Waterbury, Conn., with a pocket comb and case bearing the suggestion, "Get this through your hair." "There are 20,000 Dunning boilers in use."

ZIEGLER BROS., plumbers and steam fitters, Elgin, Ill., have completed a large steam job in Ackemann Bros.' block, and have under contract a water works job at Carpentersville for Mrs. G. P. Lord. The job consists of two power pumps of 5000 gallons per minute each.



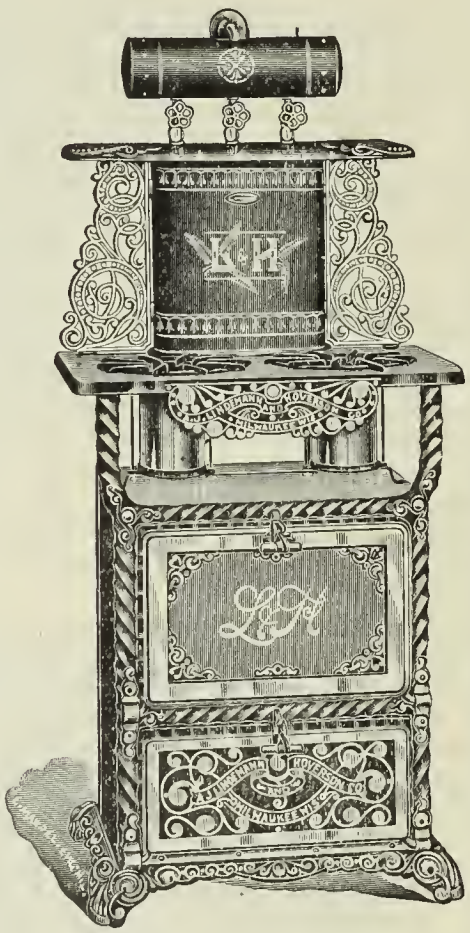
THE MCCORMACK STEAM HEATING COMPANY, Wallingford, Conn., have been awarded the contract for heating the new Gay flats on Chapel street, New Haven.

J. C. Walsh of Chicago, known to many of our readers as a manufacturer of gasoline torches, was killed last week by an explosion of gas at the Gaynor Hotel. A few years since he was severely injured by an explosion of gasoline.

THE RETAIL STORE.

Browne's Tea and Coffee Urn.

A tea and coffee urn combining a number of interesting features of construction has lately been introduced to the trade by F. E. Browne of 314–316 South Spring street, Los Angeles, Cal. The urn is intended for use in hotels, restaurants, coffee houses, &c., and reference is made by the manufacturer to its elegance and economy. The construction is such that there is no metal in contact with the milk or coffee, as the jars of the urn are made of cast iron lined outside and inside with porcelain, and the bottom is so arranged as to completely drain the jar. The urn is provided with a flat cast iron porcelained cover which fits both jars and is designed to be used on either. In the engraving presented herewith the cover is shown provided with a copper or nickel plated dome or ornamental top to prevent the radiation of heat. Portions of the sides of the urn and jars are broken away for the purpose of showing the interior arrangement. Each jar is incased in a highly polished heavy copper or nickel plated casing, that of the coffee jar being water tight and forming a water reservoir and



Browne's Tea and Coffee Urn.

steam chamber around it. The coffee or tea is heated through the medium of water and steam and is brought nearly, but not quite, to the boiling point, so that the contents of the jar will retain its aroma and flavor for a number of hours. The urns are so constructed that worn faucets can be quickly and easily replaced at small expense. The coffee jars have a capacity of 5 gallons and the milk jar of 2½ gallons.

The L. & H. Process Stove.

The A. J. Lindemann & Hoverson Company, 223 Reed street, Milwaukee, Wis., have brought out a new process stove, of which the cabinet style is illustrated in Fig. 1 of the cuts. It has a large, high shelf, a large oven and is neatly trimmed and richly decorated throughout. Among other special features the oven shelf is peculiarly worthy

The L. & H. Process Stove.—Fig. 1.—Front View of Cabinet Style.

of notice. This shelf is made on an original plan, of wrought iron, so that it is not only very light and strong but will not break if it should fall. A single strip of metal is used, which is bent into the necessary shape of an oven shelf and riveted at the sides so as to form a rigid piece of work. This cabinet stove is made with two top cooking holes two top holes and step, and three top holes and step. The company also manufacture process stoves with open frames in all sizes.

The burner used by this company is of original design, covered by their own patents, a sectional view of it being given in Fig. 2. The subflame is in a heavy bell shaped casting, surrounded by a chamber, in which air is heated and forced up to the carburetter. On the admission of gasoline into the carburetter it drops on a number of vertical corrugated strips of metal, where it becomes volatilized and commingles with the heated air. No asbestos is used to absorb the gasoline and no material is introduced for the purpose of saturation. The manufacturers state that by this means all smell is avoided when the valves are closed and the burners extinguished. They also claim that the direct supply of heated air forced to the carburetters

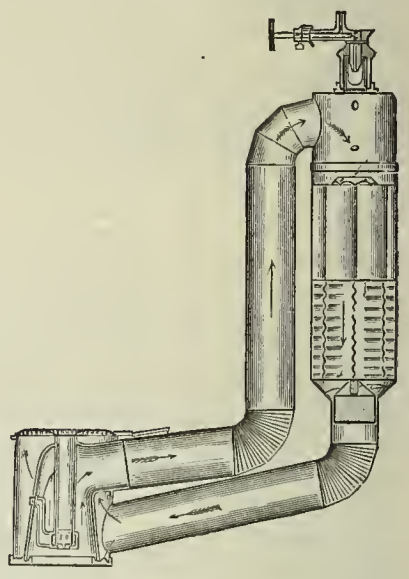


Fig. 2.—Sectional View of Burner.

greatly increases the calorific properties of the volatilized gasoline.

MEMORANDA.

The Niles Mfg Company of Niles, Ohio, are meeting with a gratifying demand for what is known as the Crusty Bread Pan. Those who have handled it speak in high terms of its merits, and the manufacturers are looking for an extensive trade in it. The pan is made of cold rolled steel, with a smooth finish, and measures inside 4x14 inches. The bottom of the pan is curved, and the corrugated ends are flared sufficiently to allow the pans to be nested for shipping. The curved bottom is claimed to have the merit of retaining the moisture, so that the bread is much more satisfactory than would otherwise be the case. The makers state the shape and size of the pan is such that the loaf is thoroughly and perfectly baked to its center, while producing a sweet, crisp crust over the entire surface.

W. P. Phillips & Co. and Webb, Stevenson & Co., Nashville, Tenn., have consolidated their stove and tinware businesses under the style of Webb, Stevenson & Phillips.

Royal & Slusses, dealers in stoves and tinware, Hawknisville, Ga., have gone out of business. They are succeeded by W. E. Greyson.

The Torrance Iron Company, Troy, N. Y., are putting on the market a new mop wringer which they claim "wrings the mop without a slop."

The John Tobin Mfg. Company, Newark, N. J., are issuing a circular of their Best Coffee Pot, claiming that it makes coffee that is as clear as wine, in

a minute. It is made of planished tin and provided with a patented device for straining. The pot is said to be quite popular and having a run wherever introduced.

WILLIAM GILMORE has purchased the interest of William Randall in the Randall & Ward stove truck concern at Le Roy, N. Y. Hereafter the firm name will be Ward & Gilmore. The retiring partner, Mr. Randall, will give his entire attention to the manufacture of wire fence.

THE PARTNERSHIP existing under the firm name of C. C. Smith's Sons Company, 301-303 Wabash avenue, Terre Haute, Ind., was dissolved by mutual consent on Monday, January 28, Edwin F. Spottswood retiring from the concern. The business will be continued by A. N. and H. S. Smith, who assume all indebtedness of the company and to whom all accounts and notes due are payable. The company are extensive dealers in stoves, ranges, furnaces, mantels and grates, hardware, agricultural implements, &c.

PRICE & POLK, Jackson, Tenn, dealers in stoves and tinware, have dissolved partnership. Thomas M. Polk will continue the business.

H. F. LIVERMORE & Co., 34 Oliver street, Boston, Mass., will look after the New England States business of the National Wringer & Mfg. Company, Canton, Ohio.

The Art of Display.

BY FOSSIL.

The desire for "showing off" is inherent in human nature, being as old as original sin. We may imagine that the primitive Edenites, when the matter of their first clothing was considered, had some regard to the color and fit of their fig leaf garments; also conclude that the universal interrogation: "How do I look?" arises from our common heredity. The motives for attracting favorable attention are various, but perhaps that which leads to "pear in' out" and "walkin' pride" is the earliest acquired. In maturity we transfer a portion of the inbred personal pride to a pride of pocket, and study how we can best fill the same through inducements to the purchasing public. From this arises "advertising," which is an important business motor and recognized in its many forms as a necessary factor in desired success.

It is the purpose of this paper to refer to that form of advertising which consists of showing the thing rather than telling about it. It has been said that "figures don't lie," but it is generally considered that this reputation for veracity does not extend to oral or written statements; also skeptical people say that the proverb only applies to lay figures; therefore, as "seeing is believing," it is pertinent to the subject to offer an opinion as to the way of making our display magnetic, or in common phrase to draw trade. He who calls attention to his place of business by an attraction which is entirely foreign to his trade, may succeed in enlisting the interest of curiosity, which may be desirable if it leads to anything better, but often it is like a bare polished hook which fishes may possibly admire but do not bite at. That showing which excites curiosity, but does not satisfy it, is to be preferred, because it invites to a further investigation and perhaps contact with the offered temptation, which is more likely to change the possible into a probable customer. A passing traveler once saw the tail of a calf protruding through a hole in a door. Having his curiosity awakened, he came to the conclusion which the evidence seemed to justify and applied at the door for further proof.

"Where is the calf?" he inquired of the occupant "I was wondering how it got through so small a hole."

"That is my sign." said the other, "and this is the office of my tannery. I can show you some good leather, &c"

The story does not tell if a sale was made or not, but the unique sign caused two movements toward it. It is doubtful if any display can long retain the attraction of its initiative, for we are not favorable to anything stale either to see or to eat. The adage, "A thing of beauty is a joy forever," will not apply to those stereotyped window dressings which the passerby gets as familiar with as with his own old clothes. For this reason there are few illustrative signs that do not become monotonous after a contined acquaintance, and liable to another proverb, "Familiarity breeds contempt."

The three balls of the pawnbroker and the wooden effigy of the tobacconist are recognized as legitimate trade-marks, but there is nothing inviting about them, and they only give us the pointer we are looking for. In front of a store in incognita there may have been seen for years back, and perhaps now, if it has survived exposure, a counterfeit small boy that was supposed to hint at clothing for sale. This inanimate youth always wore the same faded suit and ancient covering because his owner saw no use in exposing anything new to the street dust. The boy marked a place to trade, but did not invite it. Of course the average dealer does not display after that fashion, but not a few incline toward it. Perhaps the successful artist of display should be born, not made, but he who can engage a curiosity that stops to see, an interest that leads to investigation and a desire to possess, is likely to have a satisfactory result.

Reading Stove Dealers' Association.

The Stove Dealers' Association of Reading, Pa, recently held their fourth annual banquet in the new annex of the Café Bissenger, in the city named. The association was formed for the mutual benefit of those engaged in the retail stove and hardware trades, and for the purpose of maintaining uniform prices on the goods handled. At the banquet in question representatives of both the Reading Stove Works and the Mount Penn Stove Works were invited guests, the toastmaster being Charles A. Prizer of the former concern. At 8 o'clock the members and their guests sat down to a bountiful spread, which was excellently prepared and splendidly served. The decorations were entirely unique in their way and consisted of a display of tinware and stove supplies, which, according to a local paper, "would have stocked a small shop." In the front the center of attraction was a tin man, the hat being a tin kettle, the head a tea kettle, the body a lard can, the legs stove pipes and the arms pint measures, funnels and scoops. It was made by Lewis Dauth and William T. Hain and was the subject of no little comment on the part of those present.

The members and guests found at each plate a miniature article of tinware attached to baby ribbon, which they tied in the lappel of their coats. By a singular coincidence, though it might have been a joke, says a local paper, Charles S. Prizer found a miniature tin cup at his plate and he was dubbed the original tincupper of the Eighth ward.

President Bitting occupied the place at the head of the table, and on either side sat ex-presidents Milton H. Schnader and Wm. T. Hain. When the covers were removed Charles S. Prizer was introduced as the toastmaster, and in a few pleasing remarks he introduced the new president, Wm. H. Bitting.

Toastmaster Prizer called upon the following members, who responded: Lewis Dauth, an honorary member, who has a voice of good range; M. H. Schnader made a grate speech; Walter S. Prutzman spoke on poker, iron and otherwise; Wm. S. Rapp, Wm. T. Hain, Grant Nagle and Harry E. Richards also fired up the members with good speeches. The toastmaster, at the conclusion of the speeches, tendered the thanks of the association to Mr. Bissinger, to which the latter fittingly responded.

Those present were: W. T. Hain, Lewis Dauth, Harry E. Richards, John P. Dauth, William Bridegam, U. J. Mast, Milton H. Schnader, Grant Nagle, Charles Nagle, Willis Bridegam, Arnold Dauth, William B. Yeager, Jacob Otto, Walter B. Prutzman, F. Wagenhorst, Wm. H. Bitting, T. G. Hill, N. Lewis, J. L. Fett, N. Homan, Wm. T. Crosby, Chas. Fredericks, R. A. Rankin, J B. Ganter, James Hafer, J. Luigard, R. W. Poff, John Bewley, A. DeWitt, Birdesboro; H. C. Geissler, Harry Geissler, Samuel Geissler, Geo. Ritter, Geo. Hassinger, Wm. S. Rapp, Chas. B. Prizer, Charles Williamson, Robert Shick, E. Painter, John Hentzell, Chas. P. Hoffman, Adam Kolb, Henry Speice, Christian Geissler.

The committee consisted of Wm. T. Hain, Lewis Dauth and Harry E. Richards.

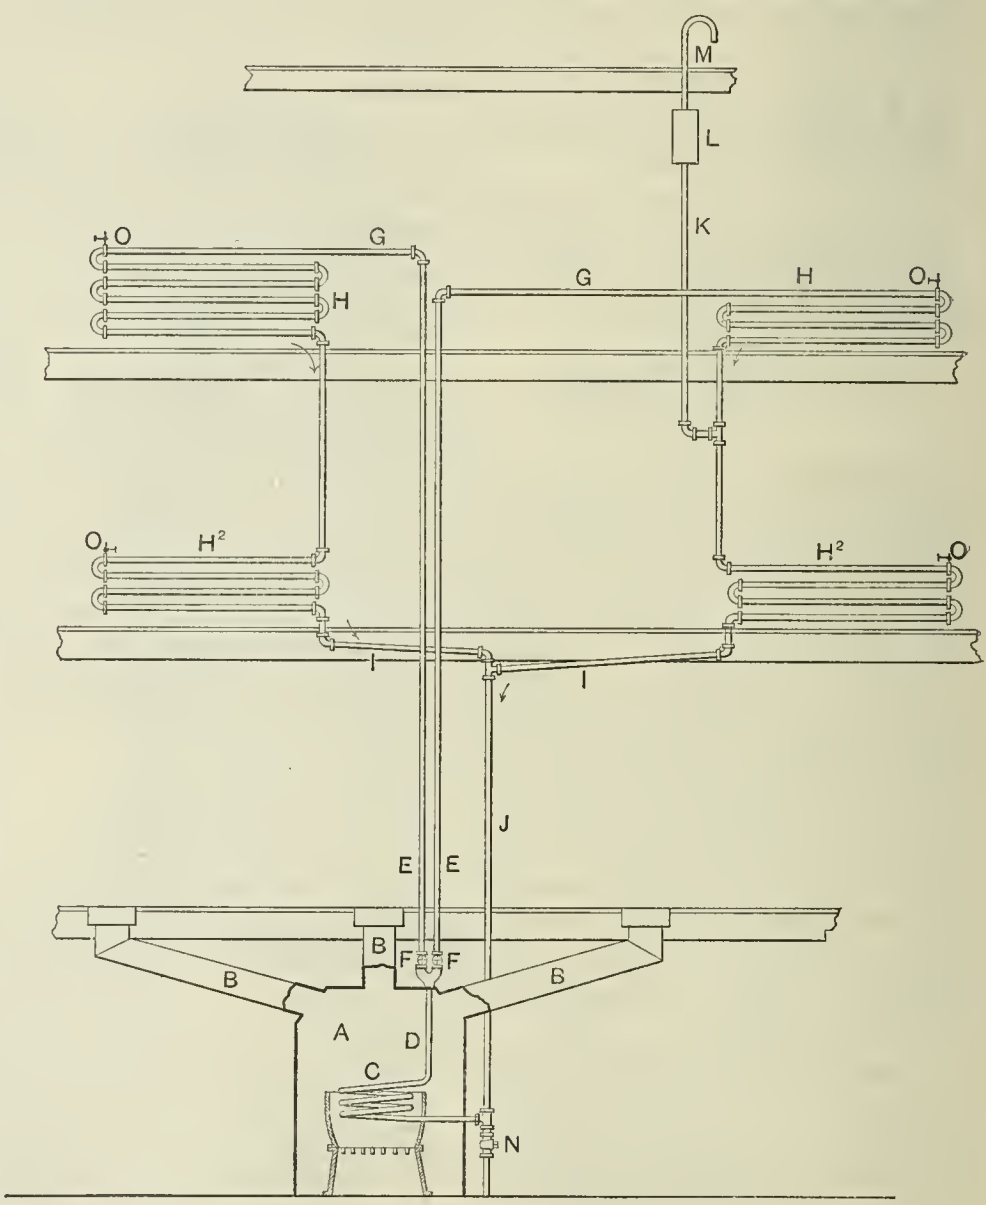
The officers of the Association for the ensuing year are: William H. Bitting, president; Charles Markley, vice-president; Harry E. Richards, secretary, and William T. Hain, treasurer.

United States Consul Lathrop, at Bristol, England, in a report to the Secretary of Agriculture gives some interesting information relating to the corn importing countries of Europe, from which it appears that eight countries imported during the fiscal year ended June 30, 1894, over 134,000,000 bushels of corn. Of this amount the United Kingdom took over 70,000,000, and Germany nearly 33,000,000 bushels; France took 10,500,000, and Holland and Austria Hungary each took 6,500,000; Belgium took nearly 5,000,000, and Denmark and Switzerland 1,750,000 bushels each. The bulk of the corn imports of Great Britain comes from the United States and Roumania, Russia, Canada and Turkey being drawn upon to make up about one-fourth of the supply. Nearly half the corn imported into Germany comes from the United States.

It is announced that the naval programme approved by the British Cabinet involves the construction, within the ensuing financial year, of four first-class, four second-class and two third-class cruisers, 20 torpedo boats and 20 torpedo boat destroyers. The cost of these vessels will aggregate about $32,500,000.

STEAM AND HOT WATER.

Heating from a Coil.



From C. A. W., *Chicago, Ill.*—I would like to learn through *The Metal Worker* how to pipe a room for heating it with hot water to secure the best results. The room is located over a store in which there is a large heating stove. I shall use the room, which is 18 x 22 feet with a 10½-foot ceiling, for a workshop, which will have a work bench extending all across the back end, which has a Western exposure. The proprietor wants to heat the shop from the coal stove, and thinks that a pipe can be run from a coil in the stove above the smoke pipe; then through the floor and up to the ceiling of the shop, so as to avoid a door which is in the shop. In returning to the stove it will connect with a pipe coil, as he does not wish to use a radiator, but he does not know what size pipe or how much of it to use. I have my doubts about it keeping the room warm, as it is in the west end of the building and the work benches have to be at the west end on an outside wall. The building is of brick and a stove pipe runs up to a chimney which stops at the ceiling of the shop.

Answer.—If the stove in question has sufficient heating capacity to heat the store in which it is and the water that would be necessary to heat the shop, it seems as if there would be no difficulty in piping the job so as to give good results. Using the cubic rule in determining the amount of heating surface that would be required in the room, we find that about 140 square feet of radiating surface would be required. This is allowing 1 square foot of radiating surface to every 30 cubic feet of space. Owing to the large size of the radiator, it is probable that 1¼-inch would be better in this case than 1-inch pipe, and in order to expose 138 square feet of surface 322 lineal feet of 1¼ inch pipe would be necessary. The placing of this pipe might be either in a return bend coil or in a manifold coil, and in order to get this amount of pipe in a room it is probable that it would be necessary to have the coil extend across one end of the room and a few feet along each side. It is quite a common practice to place the radiating coil under the work bench, and no objection is made to it by the workmen. A heating coil placed in the stove has a superior heating surface and will take care of more square feet of radiation than is generally rated for a regular hot water heating apparatus, provided that the fire chamber is of ample size and a good fire is carried. Calculating on such conditions, 1 square foot of surface would be required in the heating coil in the stove for every 30 feet of radiation in the pipe coil in the shop, or about 5 square feet of surface. This would amount to about 11⅓ lineal feet of 1¼-inch pipe in the coil in the stove. This coil is preferably located just above the fire, so that it has the radiant heat of the fire and also the heat of the products of combustion. In piping the job the flow pipe from the coil in the stove should run with a positive ascent, so as to avoid air traps, to a point near the ceiling of the shop. Here should be placed an expansion tank, and when connected with the flow main at the highest point it will also serve as an air vent. The pipe from the flow main to the expansion tank need not be over ½ inch in size. From this point the flow main should drop to the radiating coil. In placing the radiating coil care should be taken to so grade it that any air that may be in it may escape up to the expansion tank. The return from the radiating coil may be run back to the stove and connected to the heating coil in the most convenient manner, but always preserving a fall to the stove. Water in being heated expands one-twenty-third of its bulk, demanding more space, and in order to prevent the expansion tank overflowing it should be of ample size.

Combination Heating.—III.

BY J. W. HUGHES.

The question of furnace and the best form of coil or heater adapted to it being decided, the fitter has next to consider the general plan or layout for the mains and branches to suit the different coils and radiators. As the buildings to be warmed differ in plan, so will the placing of the different pipes vary, and as long as the general principles controlling the circulation of water under the effects of heat are not violated the apparatus will work. But there is no doubt but that certain plans on a given job will work better than others. The main object to be kept in view is to so arrange the pipes as to allow of the greatest freedom of circulation. To this end undue friction must be avoided

Combination Heating.—Fig. 11.—*Piping of a Successful Job.*

by not having the pipes too small, and by avoiding too many and too sharp turns, and above all, the pipes must be so arranged as to allow of their being easily filled "solid"—that is, that there be no air pockets, a bubble of air in the mains or coils acting the same as a cut in a rope.

I have for a long time looked upon the circulation of water in pipes as being similar in principle to the pulling on a rope. There is no, or very little, push possible; it is nearly all pull, the pulling force being the difference in weight of the two columns. The weight in the return being greater than that in the flow pipe, on account of the expansion of water through the application of heat in the flow pipe or column, and the consequent greater density, or weight, in the return, causes the water in the return to fall or gravitate toward the point where the disturbance of the equilibrium is taking place—viz., in the heater. As the water in the heater becomes hot it expands and becomes lighter than the unheated water, and by the agency of the law of gravitation ascends to the top by the rising main or flow pipe, the colder (denser, not heavier) water flowing in by the return. As long as the motive power (heat) is applied this goes on continuously; but as the difference in the weight of the two columns of water—viz., that in the flow and return mains—is very little, it takes very little to stop it. It can be compared to a rope over a wheel. As long as the rope is intact and power is applied to pull it the rope continues to revolve as a whole; but cut the rope, or, in other words, break the continuity, and the motion is lost. You may pull part of it or push part of it, but the steady, even motion (circulation) is gone. A bubble of air in the pipes separates the water, and acts in the same manner as cutting the rope. In part of the system circulation may be maintained, being the same as working part of the severed rope, or the heat imparted to the coil may cause motion, but that is due to another powerful agency, steam, and it is no longer a quiet, continuous hot water circulation. Neither is it a regular working steam system, the presence of water in the return pipes preventing them working as proper steam returns. In making the foregoing statements I am aware that in some respects I differ from scientific writers on the subject of hot water circulation, but from a practical point of view it seems to act as described. Perhaps, scientifically, it should not; practically, to all appearances, it does. The lesson to be learned from this is to avoid everything that will prevent the pipes and coils from being solidly filled with water, and that will prevent the water from flowing freely in the direction in which it should go—that is, up from the heater when warmed, and back and down to it when cooled, or deprived of the heat that has been imparted to the air of the apartment to be heated.

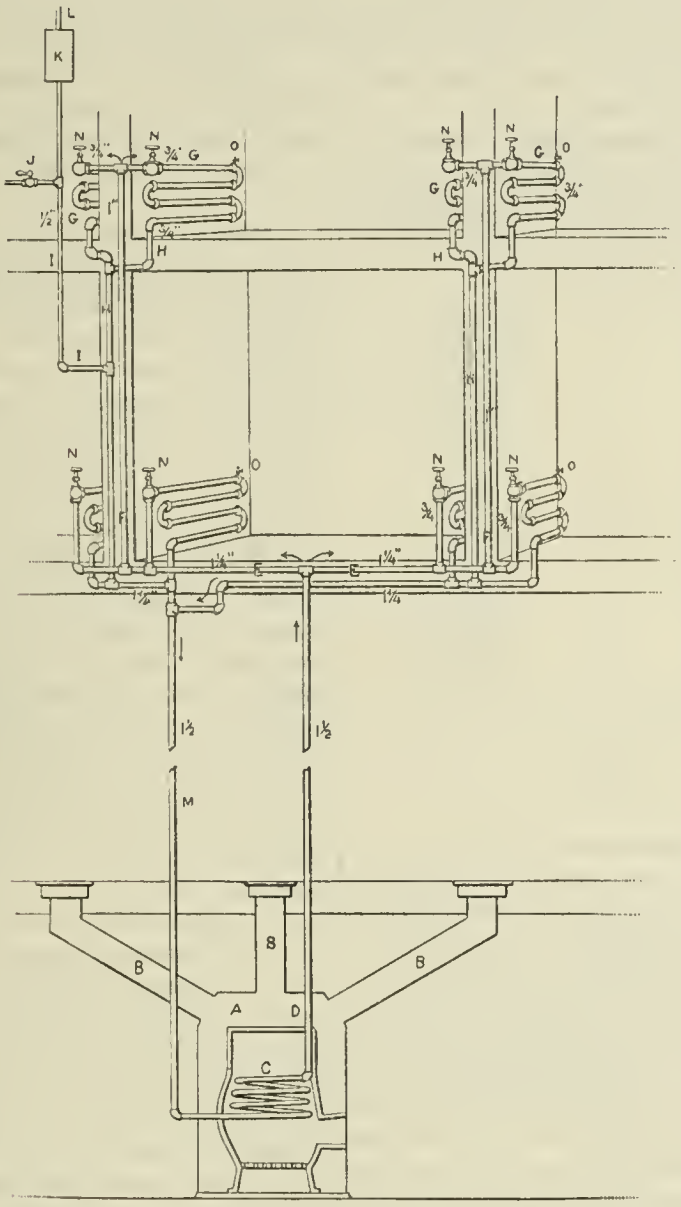


Fig. 12.—Pipes Arranged as in a Straight Hot Water Job.

In fitting the ordinary hot water apparatus it is possible to vary the sizes of the mains, both flow and return, and so proportion them to their work. The combination system is of necessity restricted in a greater or less degree by the size and make of the hot air furnace, and the possibility of fitting a given sized coil or heater in it. The fact must not be lost sight of that in a building warmed with a combination apparatus, air from the furnace is the principal factor, the heat from the hot water circulation combined with it being a useful adjunct or assistant for warming certain portions of the building to which the hot air cannot gain access, or to increase the heat where the hot air would only be partially sufficient. For this reason the apparatus must, as far as possible, be designed to work as a harmonious whole, and valves on the coils should be avoided. If the house becomes too warm, the heat can easily be controlled by the agency of the different keys and check drafts with which all good furnaces are equipped. But to shut off a coil on a general circulation makes an immediate and serious disturbance that is apt to throw the circulation out of gear and cause the formation of steam, with the accompanying noise. And when the checking of the fire causes the condensation of the steam the pipes will no longer be solidly filled with water, and, as a result, there will be a poor circulation or none at all, and the whole work of exhausting the air will have to be gone over again.

The following proportions of heaters or coils in furnaces to the amount of heating coils or circulation in rooms are from actual jobs that worked well, and form part of a record kept in the effort to establish a proper ratio between the heating coil and the work it would do in a satisfactory manner. While no actual rule covering the whole question was ever made as a result of the record kept, yet the fact was established that there were limits above or below which it was not safe to go. Difference in strength of chimney draft, kind of fuel, construction of building, &c., were all important factors, constantly varying, that prevented anything like mathematical exactness in laying down a rule. There is one rule that is positive, and that is to provide for a perfectly free circulation. This will neutralize in nearly every case defects in proportioning the size of heater to coils, and while it will not make up for a shortage of heating surface intended to warm a given area, it will even help out wonderfully on that point:

Thirty feet of 1¼ inch spiral coil in dome of furnace with 1¼ inch flow and return and 1 inch and ¾ inch branches heated 1300 feet of 1 inch circulation coils; 11 feet 1¼ inch heater pipe did the same for 380 feet of ¾-inch coils; 11 feet 1¼ inch coil with 1¼-inch flow and return and 1 inch branches took care of 260 feet of 1 inch circulation coils; 9 feet 6 inches of 1¼ inch heater coil with 1¼ inch flow and return mains and 1-inch branches to coils carried 240 feet of 1-inch circulation; 13 feet 7 inches of 1-inch coil with 1-inch flow and return branched off to 1-inch and ¾ inch supplied 550 feet of 1 inch coils; 12 feet 7 inches of same sizes to 325 feet was a success again; 12 feet of 1-inch to 320 feet of coils worked well; 11 feet 10 inches of 1-inch with same sizes for distribution carried 439 feet of coils; 14 feet 6 inches of 1 inch to 400 feet same sizes, and 13 feet 2 inches of 1¼ inch with 1¼ inch flow and return, 1-inch and ¾ inch distributing branches, to 490 feet of 1-inch coils gave good results.

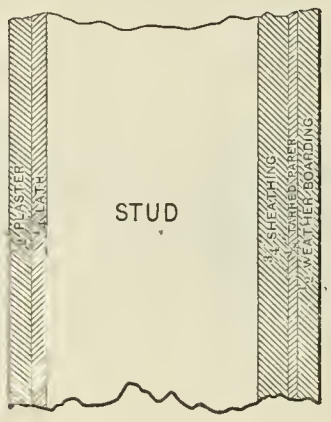
Fig. 11 shows a method of piping that worked very successfully. A, hot air furnace; B B B, hot air pipes; C, heater coils; D, 1¼-inch flow pipe divided by a

Y-pipe into two 1-inch flows, E E; F F, stop valves on flows E and E, not to shut off but to control and separate flow through the 1-inch flows E and E in case the water had a tendency to circulate more to one side than the other. These valves when once set were seldom afterward touched. G G, branches to top coils H H, through circulation coils H H and H^2 H^2, in the direction of the arrows, made the coils as far as circulation was concerned practically one; I I, 1-inch returns branched into main 1¼-inch return J to furnace; K, ½ inch expansion pipe to tank L; M, open overflow pipe; N, water feed cock; O O O O, air cocks.

Fig. 12 shows another arrangement permitting of valves being fitted on the coils, and the piping more nearly approaches the methods used in a straight hot water job than Fig. 11. It shows furnace A with hot air pipes B, heater coil C, 1½ inch rising main or flow D, which is branched at first floor into two 1¼-inch pipes, E and E, from which are taken ¾ inch branches to supply the coil on first floor. These mains E E are again branched from for the 1-inch risers F F, which are carried up in partition to supply coils on top floor, where they are branched ¾ inch for the coil supplies, returning through the pipes H into the main return M. N shows the valves on the different coils; O, the air cocks; I, the ½-inch expansion pipe; J, feed cock supplied from some adjacent water pipe; K, tank; L, overflow. The method of dividing the flow and bringing back the return is clearly shown, the arrows giving the direction of movement of the water. The coils generally used were circulation coils, as shown, and were secured to the wall by straps and back plates, the coils being made with close straight bends—that is, without pitch—the object being to make them more compact. They were generally fitted above the baseboard, and sometimes box coils were used similar in construction to the ordinary box coil made for steam heating.

Loss of Heat and Radiation.

From H. T. G.—Please answer the following questions in *The Metal Worker*:



1. What number of heat units are lost per square foot per hour for a difference of one degree between the external and internal air by the external wall, a section of which is shown in the accompanying sketch?

2. What number of heat units are emitted per square foot per hour by both direct and indirect radiators with the water and steam in the radiators at the following temperatures: 120, 140, 150, 160, 170, 180, 190, 200, 210, for water and 220, 230, 240, 250, 260, 270, 280, 290, 300 degrees for steam?

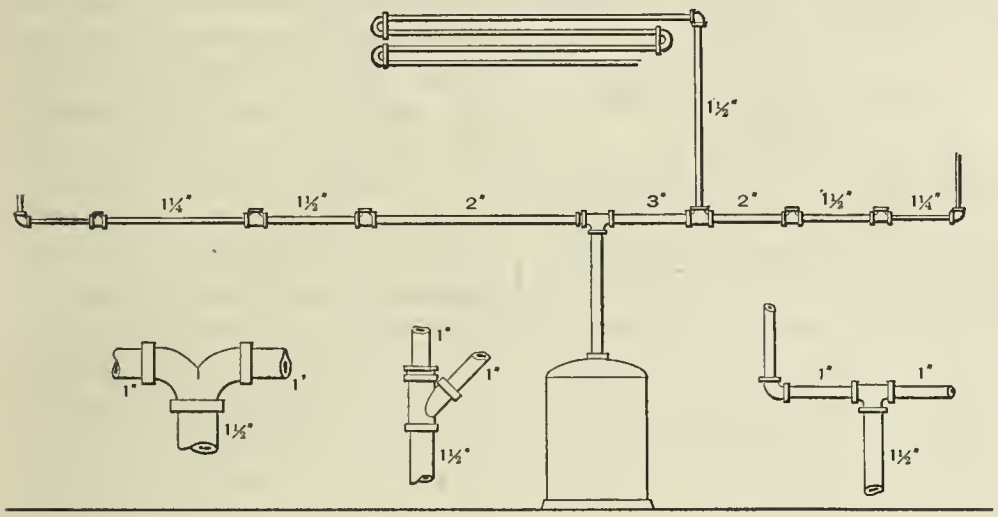
3. Would the same amount of heating surface be required to raise the temperature in a room on the third floor of a building to 70°, external air zero, as in the same size room and under exactly the same conditions on the ground floor, all the building being heated?

Answer.—On pages 38 and 39 of *The Metal Worker* for October 1, 1892, Leicester Allen gave a rule for determining the transmission of heat through walls of buildings, and among examples illustrating the use and value of the rule he cites a case of a wall which may be considered, for all practical purposes, the same as that shown in our correspondent's sketch, and illustrates it in Fig. 2 on page 38 of the issue named, which cut is reproduced herewith. He finds that the loss of heat through such a wall per hour for 1° of difference between inner and outer temperatures is the same for a surface of 2.6381 square feet as it would be through a square foot of glass under like conditions. The loss for a square foot of glass for a difference of 1° being 0.53 heat unit per hour, we find the loss through a square foot of the wall by dividing 0.53 by 2.6381, and the answer is 0.2009 of one heat unit. If the outside temperature were —10° F., and inside 70°, the total loss per square foot per hour would be 0.2009 multiplied by 80, or 16.072 heat units. This in a case where the outer surface radiates freely into space.

2. If the numbers given below for the amount of heat imparted from direct radiators at the temperatures named be divided by two the results will be

Some Questions in Heating.—Section of Wall.

practically near enough for indirect surface as ordinarily used, or where the air to be heated is not driven through them by the use of blowers. It must also be premised that there is a great difference in direct radiators in their power to impart heat. A radiator with three rows of loops or vertical tubes will not impart as much as one with two rows, and the latter will give out less than one having only a single row. There are also differences in heating capacity due to form of loops, and extended surface gives out less per square foot than plane surface. It is obviously too much of an undertaking to give figures at the different temperatures named by our correspondent for every variety of radiators in the market, and, besides, the experimental data for doing this are not obtainable. There are a great many radiators in the market that have not been accurately tested. Some sort of surface must therefore be assumed, and we will therefore figure for what is about the average for direct radiators with two rows of loops or tubes, 36 inches high, for surface, as rated by their manufacturers. Our correspondent gives the temperatures of the radiators, but does not give the temperature to be maintained in the rooms, but we suppose that this is to be 70°. This being the case, the average direct radiator of the kind above named, when set with average skill, will, at 120°, give out about 90 heat units per hour for each square foot of rated surface; at 140°, 126 heat units; at 150°, 144 heat units; at 160°, 162 heat units; at 170°, 180 heat units; at 180°, 198 heat units; at 190°, 216 heat units; at 200°, 234 heat units; at 210°, 252 heat units; at 220°, 270 heat units; at 230°, 288 heat units; at 240°, 320 heat units; at 250°, 340 heat units; at 260°, 364 heat units; at 270°, 384 heat units; at 280°. 406 heat units; at 290°, 424 heat units, and at 300°, 440 heat units. As already said, these figures should be divided by two to get the amount imparted by indirect radiating surface in average practice. The figures are given from records of experiments, not with plain pipe surface, but with direct radiators in actual use.



3. There is quite a diversity in practice as to reduction of radiating surface for rooms of the same size on second, third, fourth and fifth floors. In some cases these rooms feel the effect of heat from rooms below more than in others. In cheaply built buildings, such as are most of our city flats, when all parts are heated the air warmed below rises through halls and floors more than in well constructed buildings with fewer stories; and in well built houses, where a large hall is kept constantly heated, the upper rooms will generally not require as much radiator surface as do heated rooms of the same size situated directly below them. In this, as with many other points in heating buildings, no hard and fast rule can be laid down, and the fitter must be guided by judgment and experience. It is quite common to allow a reduction of one-tenth for each successive upper floor if the rooms are large. Thus, if a square room on first floor requires 80 square feet, the next above, if of the same size, would need 72; the third floor, 64; the fourth, 56, and the fifth, 48 square feet; and in many cases this arrangement would work well, but in most cases, in well built buildings, a reduction of only 5 per cent. would be safer, especially where the superimposed rooms are so small that the one on the lower floor would require not more than 40 square feet.

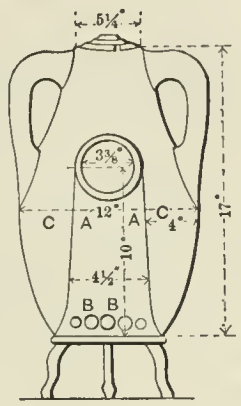
THE CONTRACT for ventilating the new Reichstag buildings at Berlin, Germany, was intrusted to Daniel Grove, an English engineer, whose plans received the first prize in open competition. The amount of fresh air required is estimated at 200,000 cubic meters per hour. This estimate provides for a thorough change of air in the parliament chamber five times every hour during the sittings, and in the other parts of the house at such frequent intervals as is likely to be requisite. A uniform temperature of 68° F. will be maintained throughout the building, partly by hot air and partly by hot water pipes. Mr. Grove has also charge of the kitchen and sanitary arrangements, which are all of the most modern and improved type.

A Pipe Fitting Question.

From C. E., *Worcester, N. Y.*—I should like to have some information as to whether or not it would be practicable to take two pipes from one opening on a main in a hot water job. I give a sketch of the flow pipe, and wish to take a 1¼-inch connection from the main at the point where it is reduced from 3 inches to 2 inches as marked, using a 3 x 2 x 1¼ inch T at this point. I intend to use a 1¼-inch nipple running into a T, which is to be bull headed, a 1-inch pipe running from each side. I intend to take a branch from one side of the T and lead it over to a coil, and from the other side I intend to run the pipe to a radiator. The question is, will such a method of taking off the branches secure good circulation?

Note.—We shall be glad to have some of our practical readers give us their opinions on this subject. The length of the mains leading from each side of a T so placed, the size of the radiators to be fed and the friction due to the method of piping all tend to secure a better circulation from one side than from the other. If, instead of using a T, a twin ell, as shown in the engraving, is used for this purpose, less trouble is likely to result. A still better plan would be to use a Y for the two 1-inch outlets. This would divide the volume and insure a better circulation through both the coil and the regulator.

A Pipe Fitting Question.



A Heating Problem.

From SAMUEL HEINS, *Rondout, N. Y.*—I notice in *The Metal Worker* of December 29 the article of "T. F. C.," with a diagram in which he asks the reason why one line of pipe works satisfactorily, while the other is a failure. It is pretty hard for any one to answer the question, because it is not stated whether steam or hot water is used. From the sketch it looks as if both of the flow pipes come direct from the top of the boiler, and it seems as if the pipe was complicated, so that there is little chance for a reader to discover just where the trouble is. A different character of drawing would have made the pipe plan more readily understood. There are several questions which if answered would render the solution more easy. The distance of the radiators from the boiler; whether the flow pipe runs straight up, and what character of radiator is used. When information is wanted the inquirer should be very particular to give the fullest possible details and make a careful drawing. From the sketch it would seem that the pipe has not been run properly. All straight fittings, such as bullhead tees and elbows, should be avoided. I have never seen a job work properly with such fittings. The character of the boiler and its distance from the center of the building and the exposure of the building are also important. The mains mentioned look large enough to supply from 200 to 500 feet of radiation. A 1¼ inch pipe will supply 125 square feet of steam radiation. The minimum size of main and return pipe for hot water heating is as follows: A 2 inch pipe will supply from 175 to 300 square feet of direct radiation, while a 1¼-inch pipe will supply 100 square feet of direct radiation. This shows that the flow mains are plenty large enough to do the work. There are a great many men who undertake to do steam and hot water heating who have very little experience, and when they get in a tight place with a job that does not work they ask for help. I have worked on a number of jobs this year that had to be overhauled by an expert to make them give satisfaction. In the past four years I have answered a great many questions and am of the opinion that inexperienced men would save money if they would study out the result that would follow their work before installing it.

A Pompeilan Boiler.

Frederick J. Smith, writing from Naples to *Engineering*, describes the boiler here illustrated:

The water tube boiler in which the fire is applied externally is sometimes spoken of as a modern invention, and the internal fire box is considered by some to belong to the time of Watt. The boiler I am about to describe shows us that the principle of internal firing was known about 2000 years ago. Among other objects found at Pompeii was a boiler of sheet metal, probably copper, as shown below. Its form is similar externally to several vases of silver found at Pompeii, but internally it is furnished with a cylindrical fire box, A A, surrounded by a water space, C C. The fire box is curved at its upper end and terminated in the side of the vase. The lower end of the fire box is furnished with five fire bars, B, B; each bar consists of a tube in communication with the water space. The internal diameter of each tube is about ¾ inch. The fuel used appears to have been charcoal, as fragments of it are to be seen in other heating vessels found at Pompeii. The joints are of excellent construction, and show, as do also many well made surgical instruments, the high culture and skill of the mechanic of the first century. The boiler is furnished with a closely fitting lid, and the whole is supported on three legs of beautiful bronze figures. I have been led to write this description of this curious tubular boiler of Pompeii, as I believe that the great antiquity of the internal method of firing is not generally known.

A Pompeiian Boiler.

Fire Caused by Radiator.

In a letter to *Fire and Water*, Philippe Douval, chief engineer of the fire department of Quebec, says: "Some few years ago a fire occurred in the Post Office Building in this city, and after investigating the matter very carefully, I came to the conclusion, and gave it as my opinion, that the fire was caused by a lot of canvas mail bags having been carelessly placed on a hot water heating pipe. This opinion was at the time questioned by some persons. Last week a fire developed itself in a house on St. Valier street, and it was found to have been caused by a hot water pipe which passed through the wooden ceiling and a deafening of sawdust. This incident will, I think, go far to establish the opinion I had at the time of the post office fire.

I have much pleasure in inclosing you a letter just received by me from Charles Barllarge, the civil engineer of this city, bearing on this subject.

Mr. Barllarge says as to dangers by fire from steam or hot water pipes, I have to remind you that it is only a few years ago, a fact of which I believe I informed you at the time, that, while I occupied house 54 St. Louis street, now tenanted by Dr. Beaupre, some light cotton children's underclothing laid on the radiators to dry in one of the upper stories was brought to me in astonishment by my wife, and found to be scorched absolutely, as if by an overheated smoothing iron. This was during soft weather, and therefore no cold, nothing to rob the heaters of their superabundant heat, due to a very hot fire at the time. This is a result which most persons are apt to doubt, and even disbelieve; the idea being that the heat of boiling water or ordinary steam—that is, steam produced under ordinary atmospheric pressure—can produce no such effect; and in truth such a temperature cannot do so, though in course of time even this will dry some woods to an extent to almost char them and reduce to the state of lignite, making them porous and of looser grain or fiber, and ready to take fire from the merest spark which under other circumstances would die out ere it had time to produce any

effect. But the fact is that just as at an elevation above sea level, you cannot, owing to the decreased pressure of the atmosphere, get a cup of hot tea unless boiled in a close vessel, in the same way in these hot water plants, the temperature goes far beyond the supposed 212° F., due to the water being confined and under a pressure of more than 14½ pounds to the inch. In fact, in an ordinary one story house and attics with heater in the basement, and where the hight to cistern or reservoir level may be 30 feet, the pressure will be two atmospheres, or 29 pounds, and the corresponding temperature of the water 256°, instead of only 212°. But in a three to four or five story house with attices, and heater in basement, the pressure on the water in the boiler will reach three atmospheres, and even four or more for greater altitudes, and temperatures increase to 274°, 292° and so on. Again, the overflow cistern or pipe leading to it will sometimes get out of order or choked or impeded in such a way that, though the hight may not be greater the pressure may be enhanced to almost any extent, and the temperature rise to 500° or more and become capable of quickly charring the softer and resinous woods, thus robbing them of their oxygen, when on cooling again they take in oxygen so quick as to produce combustion or take fire.

HEATING NOTES.

JOHN MCLEAN, formerly with the American Radiator Company, will travel in the Eastern States it the interest of W. A. Russell, manager of the New York house of the Detroit Lubricator Company, Detroit, Mich. Quick opening steam valves, hot water valves and a line of steam specialties will make his visits of interest to the trade.

OFFICIAL BULLETIN No 6 from the Master Steam and Hot Water Fitters' Association of the United States, issued from their headquarters in the Cable Building, New York, gives information on Association matters, and notes an increase in membership and an improved financial condition.

THE IDEAL BOILER COMPANY, 36 Dearborn street, Chicago, announce that they are now prepared to fill orders for all sizes of steam boilers. Quite a number of these boilers have been put in during the past fall and bear so well the test imposed upon them during the severe weather that has been experienced in the last few weeks that they push emphatically the claim that the Ideal steam boilers have no superior in the market.

THE COLORADO HEAT & FUEL SAVING COMPANY have filed articles of incorporation with the county clerk at Colorado Springs, Colo. The company is capitalized at $10,000 and the incorporators are H. J. Foote, J. F. Terrence, W. B. Boardman and F. E. Van Duzen.

JOHN W. MILLS, 100 Lake street, Chicago, has resigned the second vice-presidency of the United States Heater Company, and will again enter the field as a steam and hot water contractor. A new company will be formed, which will be known as the John W. Mills Company, and will consist of John W. Mills, also J. R. Mills and Frederic Dillzer of the Chicago Heating Company, 40 North Clark street.

C. V. KELLOGG, treasurer and general manager of the American Boiler Company, 84 Lake street, Chicago, has returned from an important business trip to Cincinnati and St. Louis.

THE ILLINOIS HEATING COMPANY, 88 Lake street, Chicago, have sold their right in the Cambridge self-cleaning boiler, which was patented by C. B. Thompson, to the J. H. McLain Company, Canton, Ohio, who will manufacture the boiler, both for steam and hot water.

THE NIAGARA RADIATOR COMPANY of Buffalo, N. Y., recently received orders from Switzerland for radiators.

THE FOWLER RADIATOR & MFG. COMPANY have removed their main office from Philadelphia to their works at Norristown, Pa., the change having been made on February 1. The company have elected a new Board of Managers for the years 1895–1896, as follows: President, A. H. Fowler; vice-president, J. R. Goehring; treasurer, John S. Waters; W. Barnhurst and S. B. Waters. The secretary of the company is C. R. Fowler, son of the president. We understand that business with the Fowler Radiator & Mfg. Company is good for this time of the year, they having some excellent orders. They particularly refer to the trade in their semi-direct radiators.

Manufacturers' Prudential Expenses.

A growing item of expense to manufacturers, says *The Iron Age*, is the apparent necessity of making special contributions to their customers or to interests allied with them. For instance, nearly every trade now has its State and national organizations, holding annual conventions. These conventions almost invariably carry with them some character of entertainment to be provided by the local members, who seek the assistance of manufacturers in bearing the expense. If local manufacturers are not sufficiently numerous or financially capable, no hesitation is felt in appealing to others some distance away. Manufacturers making a varied line of products are liable to be called on for contributions to the expenses of annual conventions in a number of trades. But the expenses do not always end with contributions of this character. In some trades the delegates do not hesitate to ask manufacturers to pay their personal expenses in attending conventions, because the local association is too poor to bear such a burden, but, nevertheless, desires to be represented. Again, a railroad company will resolve upon some character of publication to advertise the road. It may be an illustrated work, descriptive of the beauties of the scenery or setting forth the magnificence of the company's equipment, or it may be a guide book, but, nevertheless, the expense of publication is expected to be saddled largely, if not wholly, on manufacturers of railroad supplies, whose cards are inserted in the form of advertisements. The name of a railroad company has been known to be used in assisting schemes for the publication of huge posters advertising the company, but with the cards of contributing manufactuers occupying a portion of the space to preserve the appearance of rendering a return for the money contributed. It is not strange that members of railroad labor organizations should follow the example thus set and appeal to the same manufacturers to purchase ball tickets or otherwise contribute to the support of railroad unions.

Another heavy item of expense is incurred in connection with catalogues issued by wholesale houses. These catalogues are often exceedingly creditable publications, being printed and bound in the best style of the bookmaker's art. They are profusely illustrated, and generally contain numerous cuts of the specialties of manufacturers in the several lines covered. As large editions of such catalogues are distributed, it is claimed by their compilers that the manufacturers derive great benefit from the illustrations of their goods, and this benefit is capable of being measured in dollars and cents. The contributions received from manufacturers for the service thus rendered are usually sufficient to cover the cost of printing a catalogue, and in some cases it is asserted that a handsome profit has been realized. Some wholesalers have been known to go even further than this, and to authorize enterprising bookmakers to get up books of a popular character for free distribution by the house, the cost of publication being defrayed by the insertion of cards from manufacturers, solicited for the purpose.

These and similar expenses are usually charged by manufacturers to "Advertising Expense." The result is that the advertising account is often swollen to heavy proportions. When balances are struck at the end of the year, and it is deemed advisable, especially in such times as these, to retrench expenses, the large advertising account attracts anxious attention. The fiat goes forth that it must be cut down the coming year. On looking into the matter, the first channel of expenditure in advertising which is thought of is probably and very likely to be the trade paper. Disbursements on that account are ordered curtailed, and a great stroke of economy is thought to be accomplished when trade paper advertising is seriously cut down. Again there are numbers of manufacturers who recognize the value of trade papers as advertising media but who assert as a reason for not patronizing their columns that they are under such heavy expense for other forms of advertising that they cannot do so. Now we submit that it is not good policy to discard facilities for advertising which are acknowledged to be of the best character and carry with them no other consideration whatever than that of reaching the class of people sought. Those items of expense which are not for pure advertising should be placed in a separate account. Inasmuch as such expenses are incurred for prudential reasons, either to retain or secure some or all the trade of the parties to whom the payments are made, they should be charged to "Prudential Expense" or some other distinguishing title, separate and distinct from advertising. We do not impugn the motives of any person, nor do we attack the practice which has grown up in the several trades. Manufacturers have a right to expend their money wherever they think they will be benefited, and their customers have an equal right to secure whatever benefits they can from the commercial connection. But a distinction should be made between advertising for the sole purpose of reaching the largest possible number of people interested and expending money to influence the trade of one or at most a limited number of purchasers. Should such a distinction be made, we feel sure that the comparatively small amount paid out for actual advertising would be properly appreciated.

TIN PLATES.

The Tin Plate Settlement.

In less than five months from now the compromise tin plate scale adopted at Pittsburgh last month will have expired. Predictions are freely made that unless the tin plate manufacturers are granted further reductions in wages when the scale again comes up for settlement another conflict will take place. It is admitted that with the present low prices of billets those concerns who roll their own black plates and have modern equipped plants can realize a fair profit in the manufacture of tin plate and pay the compromise scale recently adopted. It is somewhat doubtful, however, whether billets will always be obtainable at $15 and less, and it is claimed that if they advance $1 per ton profits in the manufacture of tin plate will be wiped out. There is also another point to consider. The already large production of tin plates in this country, together with the tonnage that will be turned out in the near future by the many plants now under erection, makes it reasonably certain that before a great while we will be able to supply the home demand and considerably more. In this event the ruinous competition that has so long prevailed in other branches of the iron industry will extend to tin plate and wages will necessarily suffer. A Western manufacturer who has a well equipped plant and who is now operating under the compromise scale, states that with the present selling price of tin plate his profit is but 8 cents a box. He further states that a slight decline in selling prices or a moderate advance in billets will wipe out this small margin altogether.

When the situation has been carefully considered from all points of view, it would seem that wages in tin plate mills can be held at the present standard only for a time and must give way to some extent when the conditions now confronting the industry have arrived.

SCRAP.

The Monongahela Tin Plate Company, Pittsburgh, Pa., started some of their mills on Monday. The present equipment of the works, which are located in the Oliver Iron & Steel Company's old steel mill, is nine tin mills, employing about 500 skilled workmen. It is stated that the company are intending to add eight more mills, making 17 in all, which will make their plant one of the most important in the United States.

The Atlanta Steel & Tin Plate Company, Atlanta, Ind., are about to light their plant with electricity. The company at present use natural gas for lighting purposes, which costs them nothing, being obtained from their own territory; but they think the electric light is so much better as an illuminant that it will be economy to adopt it. They have also under consideration a proposition from a number of business people of Atlanta to contract for electric lights if the company will put in a plant of sufficient capacity to light a portion of the town.

As mentioned last week, the American Tin Plate Company, Elwood, Ind., started up with the four new mills which have been recently completed. This addition provides work for about 200 more men. They have at present nine tin mills in operation, with about 750 men, and are turning out about 7500 boxes of finished tin plates weekly. A tenth mill is in course of construction, which will be in operation in a few weeks' time.

The Cumberland Steel & Tin Plate Company, Cumberland, Md., have resumed operations, with a good volume of orders for black plates.

It is reported that the Blairsville Rolling Mill & Tin Plate Company, Blairsville, Pa., have made a proposition to the Amalgamated Association to pay the compromise scale rate, but without signing the scale.

We are advised by the Britton Rolling Mill Company, Cleveland. Ohio, that their black plate mills are in successful operation and that the new tinning house will be running by March 1.

The Licking Rolling Mill Company, Covington, Ky., are reported to have signed the tin plate scale of the Amalgamated Association.

The Lloyd - Booth Company, Youngstown, Ohio, have received an order for finishing machinery from the Beaver Tin Plate Company, New Lisbon, Ohio.

A proposal to raise the price of tin plates by a combination of the Welsh manufacturers, which was recently put forth by Mr. Daniel of the Cromfelin Works, seems to have fallen flat. It is generally recognized on the other side that, with the growing capacity for production of tin plates on this side of the water, any such policy would be suicidal.

The situation in the Welsh tin plate trade appears to be getting desperate. A London cable dispatch of the 6th inst. informs us that no less than 180 mills are idle, but that the Tin Platers' Union prefers complete stoppage to any further reduction in wages. The latest issue of the London *Iron and Steel Trades Journal* to hand reports the position of affairs in South Wales as serious. At present prices it is a matter of indifference to the makers whether they work or play. Orders are scarce and those received are not sufficiently attractive to induce the manufacturers to make special efforts to meet them. The prospects of the striking workmen are not, therefore, by any means bright for re employment in the near future.

The tin mills of the Ætna Standard Iron & Steel Company, Bridgeport, Ohio, which have been closed since October of last year, were put in operation this week on the compromise scale agreed upon between certain tin plate manufacturers and the Amalgamated Association. This firm decided last year to change four of their sheet mills to tin mills, but on account of labor complications the work was not pushed. Recently, however, good progress has been made toward fitting these mills for rolling black plates, and the firm expect to have them in operation early in March.

The Illinois Steel Company of Chicago emphatically deny the report, emanating from Pittsburgh, that they intend to build a large tin plate plant. The report stated that the company would erect a huge establishment, comprising no less than 30 black plate mills.

A member of one of the largest tin plate and metal houses in New York City, who is an acute and accurate observer, has just returned from an extended business tour, which embraced a number of the Western, Middle and Southern States, and has brought back with him the conviction that the country in general was never in a more favorable condition for a solid revival of business than it is at the present moment. Stocks are everywhere at the lowest possible ebb. Prices are at the bottom figure. There is much money waiting investment: and there is, moreover, a growing sentiment among consumers that the time is ripe to replenish their depleted stocks. Only one thing hinders, and that is the currency uncertainty. If the legislators at Washington would settle this matter, he is confident that an extraordinary impetus would be given to business in general and to the tin plate and metal trades in particular. As it is the general public is waiting from day to day to see what their representatives at the national capital are going to do to get the Treasury out of its hole, and until confidence is restored in this matter the wheels of the chariot of prosperity will still tarry. The individual above quoted describes the sentiment of business men throughout the country at the backing and filling methods of the law makers at Washington as one of exasperation.

Phelps, Dodge & Co., 11 Cliff street, New York City, announce that they have been appointed sole selling agents for the products of the New Castle Steel & Tin Plate Company, New Castle, Pa. The latter concern are about to largely increase their capacity for the production of tin and terne and black plates.

From the point of view of the workmen, president Garland of the Amalgamated Association expresses to the Pittsburgh *Dispatch* his satisfaction at the present situation in the American tin plate industry. Only three mills in the country, he says, are now running non-union, namely, the United States Tin Plate Company, Demmler, Pa.; the St. Louis Stamping Company, St. Louis, Mo., and Wallace, Banfield & Co., Irondale, Ohio.

The Southern canning industry begins to show signs of a revival of activity. Ten of the leading canning factories in Baltimore, which have been idle since October 1, started into operation again on Monday, and others are likely to follow suit.

PLUMBING and GAS FITTING.

Day Classes at the New York Trade School.

The class in plumbing at the New York Trade School this year is making rapid progress, some of the members having already passed on all of the work in the regular course. The superintendent, John Delehanty, has added some work to the course that was never required of the pupils until this year, which makes the progress all the more remarkable.

The lead burning class, which is made up of pupils from the plumbing class, contains over 50 members, the largest in the history of the school. This class has been divided into sections, and some sections have already received their final instructions and have examples of very fine work on exhibition. The instructor, T. B. Walmsley, has added a new method to the course this year, which is the use of a compound blow pipe with illuminating gas. This system is easily mastered after the regular system with a machine has been learned and is of wide practical use, as the plumber can always get gas, and with the blow pipe traps can be lengthened and waste pipes joined quickly and neatly.

The steam and hot water fitting class can show some fine pipe work, and under the instruction of Chas. Coolidge are rapidly becoming fitters whose work will bear critical inspection. An examination of their technical progress was recently held, and resulted satisfactorily to Thomas E. McNeill, who lectures on Tuesday and Friday of each week on a special set of questions which he has prepared. The practical and scientific instruction given in this course is calculated to make it one of the most valuable of the trades taught at the school.

Next year an effort will be made to secure a sufficient number to start the class in tin roofing, cornice and sheet metal work, and the course of instruction laid out for the class which failed to fill this year is being further perfected.

Willimantic Master Plumbers.

The master plumbers of Willimantic, Conn., have formed an association with the following members: William Vanderman, C. L. Clark, H. H. Lyman, Moriarty & Rafferty; J. J. Fay and Chamberlain's Plumbing Company. The objects of the association, in addition to becoming members of the State Association of Master Plumbers, will be a mutual effort to improve methods connected with the business. The organization will use its influence to have a plumbers' ordinance passed. There were present at the meeting James Ahern of Hartford, F. C. Weiant of New Britain and John S. Craig of Hartford. The local association elected the following officers:

President, William Vanderman.
Vice-President, Charles L. Clark.
Secretary, Frank P. Rafferty.
Treasurer, Hollis H. Lyman.

Chicago Master Plumbers.

The members of the Chicago Master Plumbers' Association and a goodly number of their friends from neighboring towns and cities spent a most enjoyable evening on the 30th ult. The occasion was the annual reception and ball of the association. It was held in the banquet hall of the Auditorium, and was a decided success in every way. The new president, P. M. Murphy, opened the exercises with a neat speech of welcome, in which pleasant sentiments were gracefully expressed, finishing his address by presenting Paul Redieske, the late president, with a handsome jewel as a token of the esteem in which he is held by his colleagues of the association. An appropriate response was made by Mr. Redieske. George Herbert then favored the assemblage with a song, after which ex-president Robert Griffith made an able address, taking the place of Health Commissioner Reynolds, who was unavoidably absent. The Latona Club, an orchestral organization, partly composed of plumbers, then rendered a fine selection, after which Scotch dances were given by Miss Maud Gordon, a piano and violin solo by Miss Lily and Master Mandable, children of M. L. Mandable, and a character song by W. W. Murray, who also read an original poem. Dancing then followed, the grand march being led by Mr. and Mrs. P. M. Murphy and Mr. and Mrs. M. L. Mandable. The arragements were of the most satisfactory character and nothing was overlooked that could contribute to the pleasure of those present.

A Live Wire and Plumbing.

In Philadelphia last week, according to newspaper report, a live wire from the trolley system broke and came in contact with an awning post and distributed the current in different directions. One current melted the lead service pipe to the building to which the awning post was attached and a flooded cellar resulted. The tin conductor on the next house was so melted at the joints that it fell on the pavement. The current then skipped past two houses, and a woman drawing water in the bathroom of the third was surprised to see a blue blaze issue from the pipes. She threw water on the flame and that, making a conductor, she received a severe shock, while the faucets were melted from the lead pipe. The employees of the trolley company were summoned and dammed the current while a plumber was employed to dam the flood. It is not known whether the morality of the damaged was sufficient to dam their wrath.

Municipal Cleansing and Public Health.

The February number of *The Engineering Magazine* contains a valuable article by Geo. E. Waring, Jr.. from which we quote the introductory portion:

It is not yet known exactly how the accumulation of filth in a town favors epidemics of disease, nor is it necessary to discuss this here; for, while there are numerous examples of long continued immunity from disease amid most filthy surroundings, there are records of a great many fatal outbreaks by which communities so situated have been suddenly devastated.

There is an almost unbroken record of the final disappearance of oft recurring epidemics and a steady improvement of the public health following the draining and cleansing of filthy towns and the supply of good water.

It is usual to measure the health of a community by the death rate. The true measure would be the health rate. There may be a vast amount of sickness, and of costly disability, with a very low death rate; but a high health rate is an unfailing index of good sanitary conditions, and it insures a low death rate as a matter of course. It is probably safe always to say that, while man may so far withstand the influence of filth as not to die from its effect, the public health—the vigor, efficiency, comfort and happiness of the people—is likely to be grievously lowered by it.

It is a fundamental principle of municipal economy that what leads to health leads to wealth. Yet there is no other self-evident proposition to which public sentiment is so indifferent. Nothing is easier than to awaken popular interest in a new city hall, a brick pavement, or a new fire engine house, and nothing is more difficult than to raise it to the paying point in favor of good drainage, clean streets and enforced sanitary regulations. It often requires the stimulus of a fatal epidemic—a sharp, quick and repeated stroke of death—to loosen the public purse-strings in the interest of the public health. Sometimes even this is of little avail, and we have to await the influence of a great popular panic of dread, as of cholera or yellow fever. The cholera scare of 1892, when one enthusiastic newspaper doctor said, "The cholera germ is actually thundering at the gates of New York," did more good to the crowded tenement house districts of that filth ridden city in a few weeks than had been accomplished during years of indifference. The first case of yellow fever at Brunswick in 1893 frightened its people to flight, and instituted a heartless "shot gun quarantine" throughout the whole region into which they fled. During the whole season there were fewer than 60 deaths, and most of these were believed by experts to have resulted from perennial "malarial fever," which is always very fatal along that coast. As a result, Brunswick is now being sewered in the most effective way, and sanitary

regulations are being enforced which, with the improved drainage, will save more lives every year than have been lost through yellow fever in any ten years, to say nothing of the reduction of sickness from minor malarial diseases, which have constantly sapped the vigor of the people.

The dread of yellow fever is not unnatural, for its devastations in Boston, New London, New Haven, New York, Philadelphia, and most of the larger Southern cities have been terrific. The improvement of health conditions seems now to have driven it into the southeastern corner of the country. Memphis was reclaimed after its very fatal epidemic of 1878-9. New Orleans was first fenced in by a quarantine which has at least coincided with immunity from yellow fever, and it is now being sewered.

It is safe to say that there are more deaths in the United States every year from distinctly "preventable" diseases, which are always with us, than have been caused by yellow fever and cholera together in all the 30 years since the war. Yet we take these deaths as a matter of course, and we pay no official regard to the 20 cases of disabling and painful illness that each death is estimated to represent.

Let us take, as a concrete example, the case of a town that has only 12 deaths from typhoid fever in a year. This disease can be entirely extinguished. Every death from it is an unnecessary death—as much so as a death from small-pox. The town in question therefore suffers, monthly, the private execution of one of its unoffending citizens, in expiation of a crime that may be partly its own and partly its neighbor's. The people accept this execution as calmly as they would accept a monthly death from old age. They go on electing the usual city officials and voting money liberally for pavements and new fire apparatus; but they leave the care of the public health to agencies that were considered adequate at a time when we still supposed that the question of life and death was in the hands of God and was to be determined largely by prayer. We now know that in this case, as in so many others, "*laborare est orare;*" but, while we may trust less to prayer than we formerly did, we are still slow in effective labor.

While great advances have been made in sanitary knowledge and practice in a few towns and among a limited class of the people, when we come to consider the 12,000,000 inhabitants of towns of more than 1000 and not more than 25,000 population, we find that, as a rule, sanitary improvement hardly exists. With the great majority of these towns the beginning of the sanitary impulse, beyond the occasional influence of a striking epidemic or the fear of an impending epidemic, has hardly yet been felt.

THE J. L. MOTT IRON WORKS, New York, are developing considerable trade in their gas furnace pot for melting metals. This has been found very convenient in printing establishments for melting their stereotype metal. It is made in three sizes capable of melting 250, 500 or 1000 pounds. The burner is arranged in the larger sizes in 11 sections, each section consuming from 15 to 25 feet of gas, as it is regulated. With six sections in operation and replenishing as the material melted, 1500 pounds of metal have been melted in three-quarters of an hour. Manufacturers who use large quantities of molten metal in their work will find this apparatus very convenient, particularly where it is not desired to run furnace continuously.

Connecticut State Plumbers.

The fifth annual convention of the Connecticut State Association of Master Plumbers was called to order at Waterbury, Conn., by President James Ahern, at 9.30 a.m. Wednesday, in a handsomely decorated hall. The president introduced Thomas D. Barlow of Waterbury, who made an address of welcome and introduced the Mayor of the city. The Mayor stated that he sympathized with the plumbers in the attempts at humor at their expense, and congratulated them on being always ready to afford prompt relief in times of need. He called attention to the new water supply of the city and extended the courtesy of the city during their stay. President Ahern returned the thanks of the association for the courtesies extended. The Credential Committee was then appointed, and a recess was taken until its report was made. The committee reported favorably on 12 new members.

After appointing the Auditing Committee the roll was called, and among those present were:

J. C. Howland.
James Ahern.
S. E. Dibble.
R. H. Stohart.
J. S. Craig.
A. J. Clerkin.
Wm. Vanderman.
F. A. Curtis.
Geo. Agard.
H. A. Despar, Worcester, Mass.
John Mitchell, President National Association Master Plumbers.
W. E. Crosby, National Executive Clerk.
A. Troland.
Major H. B. Middlebrook.
L. H. Mills.
Geo. E. Schofield.
Thomas Logan.
A. L. Brown.
C. H. Belfield.
C. S. Eames.
F. C. Booth.
J. M. Page.
D. L. Yarrington.
R. B. Chamberlain.
Edward A. Fuller.
James Donovan.
Geo. D. Buck.
F. J. Reynolds.
H. H. Goodale.
Thomas Oakes.
N. B. Bull.
E. B. Smith.
N. R. Bailley.
S. H. Beard.
H. A. Beaton.
Geo. Leckler.
J. D. Eldridge.
G. W. Hazel.
J. Monaher.
A. D. Sykes.
W. H. Marston.
Thomas Barlow.
Geo. W. Minor.
Robert Morgan.
D. A Curtis.
John Mulligan.
J. B. Weiant.
J Murray.
P. J. Tierney.

President Ahern then introduced John Mitchell, president of the National Association of Master Plumbers, who made an interesting address on the success and advantages of organization and the interests of the plumber, which was received with frequent applause. He spoke of the objection to the camp follower at the national convention, whose influence and behavior were discreditable, and stated that a welcome and a warm one would be tendered to the representative honorable business men who came to the convention to partake of its benefits.

A vote of thanks was tendered President Mitchell for honoring the Connecticut State Association by his presence. A letter was read from L. B. Cross regretting that he could not accept the invitation to attend. Letters were also read from John Trainor, Baltimore; D. G. Finnerty, Boston; W. E. Goodman, Milwaukee, and H. J. Pattison, New York, and an invitation was received from Randolph & Clowes to visit their works. The Executive Committee reported that several meetings had been held and the affairs of the association were in good condition, and that a bill had been framed and was now before the State Legislature.

The reports from the other committees were read and accepted.

S. E. Dibble read a paper on apprenticeship, which we print in full elsewhere.

H. A. Despar, Worcester, Mass., was introduced by the president, who stated that Mr. Despar had given excellent assistance to the Legislative Committee by furnishing them specimens of defective plumbing and traps to exhibit before the Legislature to aid in securing the passage of the bill now before it.

The report of the retiring officers was then read, in which the death of Alfred Hopkins was alluded to as a great loss to the association and the trade. Thanks were given to those who had assisted the officers in their work.

R. H. Stohart stated that as Alfred Hopkins had been one of the oldest, ablest and most enthusiastic plumbers, he moved that a committee be appointed to draft resolutions to be submitted to the association and after being passed to be sent to the family of the deceased.

The convention then went into executive session. After adjourning the executive session an election was held, when the following officers were selected for the ensuing year:

President, J. B. Weiant.
First vice-president, C. S. Eames.
Second vice-president, A. J. Clerkin.
Corresponding secretary, George Rapeleye.
Treasurer, John S. Craig.
Financial secretary, R. H. Stohart.
Delegates to national convention, J. B. Weiant, L H. Mills and William Vanderman.
Alternates, F. J. Reynolds and J. Donovan.

A vote of thanks was tendered the master plumbers of Waterbury for their

hospitality, and also to the retiring officers for their excellent service.

Middletown was selected as the place for holding the next convention.

The convention then adjourned to a banquet at the Scovill House. After disposing of an elaborate *menu* speeches were made by Mayor Kilduff, John Mitchell, president of the National Association of Master Plumbers, and J. B. Weiant. Not the least enjoyable feature was a quartet, singing "Love's Old Song" and "Maiden, Wilt Thou Dance?" James Ahern alluded to the Waterbury watch and the Brown boiler as spreading Waterbury's fame. P. J. Tierney of Rhode Island, M. J. Daly, H. A. Despar and Robert Morgan also spoke, after which the plumbers dispersed with pleasant recollections of the hospitality of the Waterbury plumbers and the value of association.

The Trade.

Peck Bros. & Co., New Haven, were represented by Irving B. Hotchkiss, A. J. Purdue and S. D. Baker.

Randolph & Clowes, Waterbury, by F. H. Hoffman, Frank J. Rourke and Thomas M. Hadley.

F. J. Knox, Hartford, by Dwight W. Knox and L. M. Dyer.

Henry McShane Mfg. Company, by R. H. Maguire.

The Momeyer & Story Company, New York, by N. D. Merwin.

E. S. Wheeler & Co., New Haven, by W. E. Morgan and E. W. Hotchkiss.

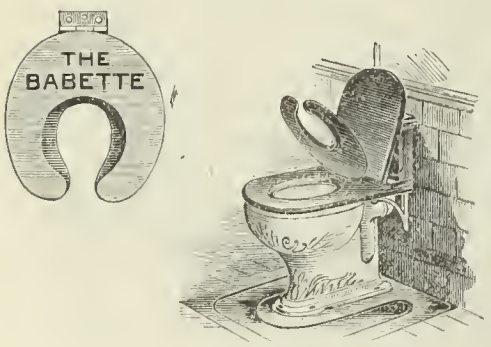
C. S. Mercer & Co., New Haven, by R. S. Woodruff.

Hopson & Chapin Mfg. Company, New London, by W. S. Hopson.

The Stamford Foundry Company, Stamford, by S. H. Plumb.

The Richmond Stove Company, by B. Mallory.

The New York Central Iron Works, by D. G. Richardson.



The Ideal Boiler Company, Boston, by Herbert E. Jones.

Randolph & Clowes, Waterbury, had a fine display of plumbers' goods in the convention hall.

The convention hall decorations were arranged by T. H. Bolger, State vice-president of the Journeymen Plumbers' Association.

Babette Seat.

The Babette Company, Disston Building, Philadelphia, are putting on the market the child's closet seat shown in

The Babette Seat.

the accompanying illustration. It is made of stamped steel, the hinge being of brass, riveted to the plate. Its construction allows of its being easily adjusted to any closet seat, and the fact that there is room for such an article in nearly every household should insure for it a good sale. It is heavily lacquered to represent oak, and is both strong and durable.

Apprenticeship.*

BY S. E. DIBBLE, NEW HAVEN, CONN.

I do not propose to give any history pertaining to this subject, but there are a few matters in connection with it to which I desire to refer. As you all know, this system formerly involved the binding out, by their parents, guardians, or other proper authority, by contract, minor children for a term of years, for the purpose of being instructed in the art or trade they professed. The old English law required a service of seven years to learn a trade, but in Connecticut no time was limited. The result was that in England a much longer time was required than was necessary in many cases, while in this country insufficient time and the lack of proper regulations have oftentimes opened the door to and subjected us to the inconvenience of unskilled mechanics. As a system apprenticeship has passed away, and there seems very little encouragement for its revival. When the master mechanic ceased to work with his apprentices, not only were the boys deprived of the personal care of their masters, but the workshop itself ceased to be a place in which trades could be thoroughly acquired, and the boys were too often kept at work which they can do to the best advantage of their masters, or even to the best advantage of themselves, without, however, learning their trade in all its various branches.

In my own experience, I am frequently requested by fathers to take their sons as apprentices and teach them the trade. Such requests are frequently accompanied with offers of payment, and when so accompanied I have always positively refused to entertain them, on the ground that a boy working without pay lacks a necessary element to ambition; for weekly pay, though small, stimulates him to do better work, and helps, I believe, to make him a better man. There should always be a thorough understanding with the parents of all boys being taught in this way, as well as with the boy himself, upon all the points which may enter into such an arrangement, such as time, services, pay, &c. I think that we do not sufficiently encourage our boys to learn our trades, whatever those trades may be, and this, in my judgment, is a great mistake.

If the master plumber is no longer able to give his apprentice his personal attention, and the benefit of a personal contact with him—his time being more profitably spent either in his office or in some place outside of the workshop—some other system than that which many of us knew in our younger days must be substituted. This substitute seems to be afforded in the trade schools, where trades are taught the youth of our land as the professions are taught in the professional schools. The modern trade school is not altogether an untried venture. The industrial schools of France are not new, and have contributed much to the wealth and prosperity of that people. England spends large amounts of money in establishing and maintaining similar schools, where young men can learn what the workshop does not teach, and what a thorough and successful application of the laws of sanitary science require. The practical man, be he a master mechanic or a journeyman, may say that it is not possible to teach in any school sufficient to equip a man for first-class work. This, to a considerable extent, is true, and is recognized in the professions. Experience in a lawyer's office, for a law student, or in a hospital, for a medical student, are essential accompaniments to the studying, which the schools afford, to make the most successful lawyer or doctor. And so it seems to me it may be in the trades. A boy in a trade school is not expected to completely prepare himself in all details, but it teaches him the laws on which a trade should be based, and by which it is, to a large extent, governed. This feature is, I think, oftentimes in danger of being forgotten, and it seems to me that in these days it is the combination of the trade school and the workshop that will produce the best results; the trade school to teach boys how to work, and the workshop to enable them to perfect, by experienee, what they first have learned.

This matter of regulating and governing our boys is an important one, more important than many of us think. It is the foundation on which the future success of our trade largely depends. This raises the inquiry, Are we doing what we can to make the plumber of the future a master plumber? Are we making him as competent and skillful as we ought to, so that when he comes before the world to care for the interests which will be his he will be able to successfully promote those interests to his own advantage and the advantage of those whom he serves? The workmen of the future should be better workmen than we are. This I say without any disrespect to any member of our association or to any plumber, be he master or journeyman, throughout the land, for it is only by improving each successive generation of workmen in any calling that the welfare of that calling can be promoted. I see no reason why our boys should not be educated, but every reason why they should be educated thoroughly. Suitable boys or young men should be selected in the first place, and then they should be carefully taught the trade in all its thoroughness and detail. Whether it is advantageous to return to the old system of indenture may be a doubtful question, but I think that no boy should be permitted to perform the duties which his trade may thrust upon him until he has served a term of years in the workshop—five, for example—beginning, perhaps, at the age of 16, with a rebate of from one to two years if he is a graduate of a trade school.

I would close by referring in this connection to the apprenticeship system now in vogue in Chicago. Under this system each employer returns to the Master Plumbers' Association a list of those working for him as apprentices, with the date when they began so to work, their ages and their places of residence. All this is recorded by some proper officer, who issues a card to the employer, to be kept so long as the apprentice works for him. When the apprentice ceases to work for him the employer makes an entry of that fact upon the card and returns the same to the association. The apprentice also receives a card from the association which passes as a voucher of his standing, and which, whenever he changes his boss, is properly filled in with the date of such change, &c., until his certificate shows that he has served the proper time. The result is that a complete record is kept of all apprentices, their fitness, residence and such other details as may be of use to employers. The period of time covered by the apprenticeship is five years.

* Read at the Waterbury meeting of the Connecticut State Association of Master Plumbers.

TRAPS AND VENTS.

IT IS REPORTED that on February 1 the Sanitary Potters' Association, which was formed in 1890, was formally dissolved by mutual consent, and the $500 posted as a forfeit by each of the 13 sanitary potteries interested was returned to the depositors. The association comprised the ten sanitary potteries in Trenton and one each in Bordentown, Baltimore and Tifflin.

AUDITOR-GENERAL GREGG, Philadelphia, will appeal from Judge Bregy's recent decision that Plumber John Gormley was exempt as a manufacturer and not a dealer. The question in dispute involves between 700 and 800 persons, and means a loss or gain to the city of between $10,000 and $12,000.

A REPORT to the Board of Health of Philadelphia finds many school buildings in an unsanitary condition.

J. M. BUTLER & SON are a new plumbing firm, in Suffolk, Va.

PLUMBER: "I want to see the tank, mum."

Lady of the Flat (snappishly): "Well, he ain't here; and what's more, I don't expect him before 2 or 3 in the morning."—*Exchange.*

THE L. J. TOWLE COMPANY, Boston, Mass., had a fire in their plumbing supply house last week.

SMITH & WOODHALL, plumbers and tinsmiths, Southbridge, Mass., have dissolved copartnership by mutual consent. Mr. Smith will continue the business.

PATRICK J. OWENS, a well-known plumber of Roxbury, Mass., died at his residence, 65 Palmer street, last Sunday night, after a long illness.

A RESOLUTION was adopted at the Sanitary Convention held at Harrisburg. Pa., last week, recommending the Legislature to pass a bill to offer a prize of $25,000 to the discoverer of the best method for the disposal of sewage by precipitation, filtration or otherwise in a solid mass so that it may be returned as fertilizer to the land.

THE KING MFG. COMPANY, West Troy, N. Y., have been incorporated by the Secretary of State to manufacture and sell the King waste water trap and other plumbing and hardware specialties. The capital is $15,000 and the directors are: Fayette B. Durant, John H. King of West Troy, and Howard A. Lansing of Menands.

A BILL to control and regulate plumbers and plumbing is to be introduced in the Legislature of Rhode Island.

MICHAEL DRISCOLL has associated with him ss a partner in the plumbing and hardware business at Cazenovia, N. Y., Floyd F. Marshall. The new firm will be known as Driscoll & Marshall, and dates back to the dissolution of the firm of Collins & Driscoll, December 15.

A MODERN PLUMBING LAW is before the legislature of Delaware.

THE PLUMBING FIRM of Beck & Keith, Winston, N. C., have been dissolved.

THE PARTNERSHIP heretofore existing between John D. Swinton, Samuel S. Van Etten, David L. Swinton and John D. Swinton, Jr., under the firm name of Swinton, Van Etten & Co., Portchester, N. Y., was dissolved on January 21. The business of general hardware, steam heating, plumbing and stove manufacture is to be continued by the firm of Swinton & Co., comprising John D. Swinton, David L. Swinton and John D. Swinton, Jr.

THE SHUSTER FOUNDRY COMPANY, South Pittsburg, Tenn., will, it is reported, double the capacity of their pipe foundry.

A SANITARY MEASURE which the plumbers throughout the country will approve has been adopted in Chicago. In a school in the thickly settled districts and among the poorer classes a complete bathroom has been fitted up, and the grimy urchins from the district are given a bath by a woman who has been specially hired for this laundry work. It is stated that as many as 30 of the dirty youngsters have been scrubbed in a day, and that beneficial results have attended the work. A proposition to extend the bathroom to other schools in the densely populated districts is now receiving favorable consideration at the hands of the Board of Education.

THE Massachusetts Association of Master Plumbers hold their annual meeting in Boston next Tuesday.

JAMES H. EUSTIS, representing the Walworth Mfg. Company, Boston, was one of the visitors at the Plumbers' Convention at Waterbury, Conn.

AT A RECENT MEETING of the Bridgeport, Conn., Master Plumbers' Association the following officers were elected for the ensuing year: President, Geo. E. Schofield; first vice-president, Msjor H. B. Middlebrook; second vice-president, Theodore Fox; treasurer, L. H. Mills; secretary, C. T. Eames; financial secretary, Thomas Logan.

GEO. H. CLOWES of Randolph & Clowes, Waterbury, Conn., is about combining business with pleasure in making an easy tour through the South and West in the interest of seamless drawn brass and copper tubing and sheet brass and copper.

THE AHRENS & OTT MFG. COMPANY, Louisville, Ky., have issued a circular in a three-color effect devoted to their enameled soil pipe and fittings, which are tested to 50 pounds water pressure. Attention is called to their smoothness, securing a perfect flushing, their non-absorbent and non-corrosive qualities, and to the claim that they can be used in an ordinary house with but a small advance in cost over tarred pipe.

F. B. WOODS, Everett, Mass., has lately purchased the plumbing stock and good will of Geo. W. Plaisted, and is about to open a shop on Chelsea street.

THE NEW BUILDING that is being erected by Disley & Weyand, at Waterbury, Conn., for their plumbing, sheet metal, cornice and skylight business is well advanced. It is to have a sheet metal front, which is already making a fine show. Progress on this building is being delayed by their press of work for their customers.

DR. JAMES CAMPBELL, P. J. Darcey, James Ahern and T. L Dowling, representing the Board of Health, the master plumbers and the journeymen of Hartford, Conn., held a session in the Board of Health rooms on Friday evening of last week, for the examination of journeyman plumbers, applicants for licenses as such. Seven men were examined, as follows: T. M. McCarty, M. J. Brazel, E. C. Kelleher, George Owens, John J. Carney, J. C. Keenan and D. O'Connell. The first five passed a successful examination and will be granted licenses. Keenan and O'Connell have yet to make a practical test to the satisfaction of the board.

PHILO STEWARD, who has officiated for a year or more as bookkeeper in the plumbing firm of N. S. & B. T. Steward, Skowhegan, Me, has purchased the interest of the junior member of the firm. B. T. Steward is soon to establish himself in the same business in Pittsfield, and Geo. Williams, also of Skowhegan, will be associated with him in his new field.

A BUFFALO PLUMBER was up before Mayor Jewett last week for violating the city ordinance in connecting the plumbing in a house without notifying the Water Department. He said one of his assistants neglected to notify the department and that he was out of the city at the time or the thing would not have happened. The Mayor has the power to revoke his license, but it is probable he will let the plumber off with a reprimand.

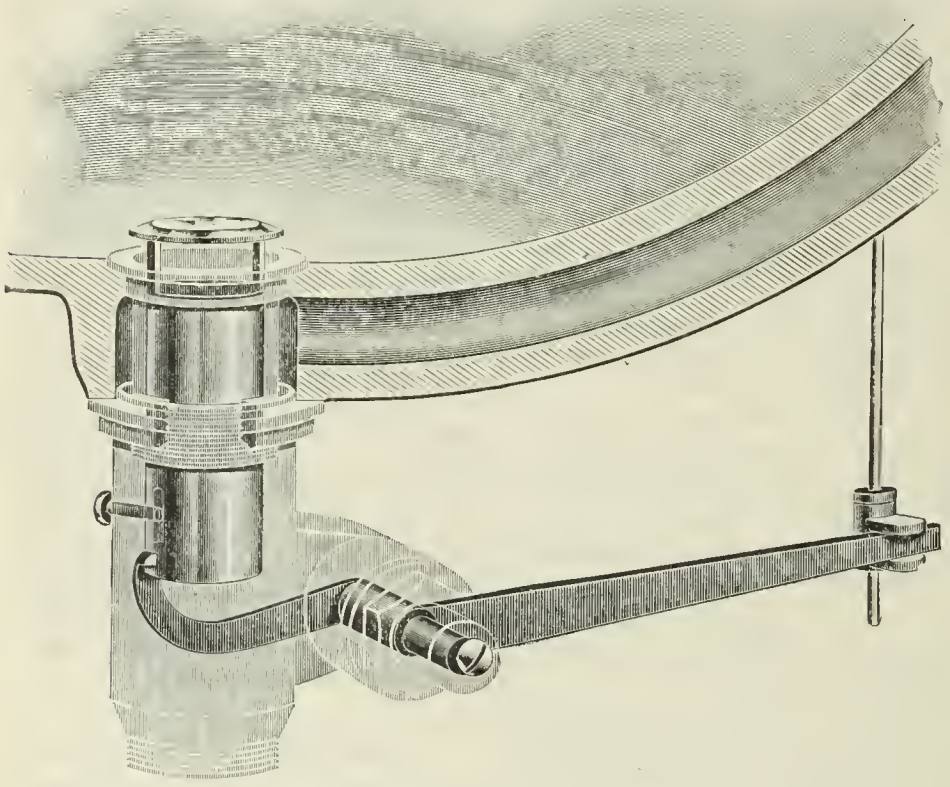
HENRY A. RATH, SR., a well-known master plumber, died a few days ago at his residence, in Elizabeth, N. J. Mr. Rath had recently visited Denver and also made trips to the South in the hope of restoring his health, but without success. He was born in New York 48 years ago, and when a boy enlisted as a drummer in the Eighty-eighth New York Volunteers and was severely wounded at the battle of Manassas. On coming to Elizabeth, Mr. Rath learned his trade as a plumber with John Hilton, before which time he had worked for the Richardson & Boynton Company. Later he entered in partnership with Charles Spittlehouse, with which connection he continued in business for seven years and afterward alone for 14 years. For the last two years the firm have been H. A. Rath & Co., his partner being Henry Kleinhaus. Mr. Rath was well known in Elizabeth and his death will be severely felt by many friends. Mr. Rath died on the twenty-fifth anniversary of his wedding and besides his widow leaves three sons and one daughter.

Chicago Master Plumbers.

The Master Plumbers' Association of Chicago gave its second annual banquet and ball last week at the Auditorium. About 500 persons were present.

Dr. A. R. Reynolds of the Health Department was on the programme for a toast, but was unable to be present. A pleasant feature of the evening was the presentation of a gold badge to the outgoing president, Paul Redieske, by Secretary Breen on behalf of the association.

Among those present were the following and their wives:



C. H. Herbert. D. Rock. J. J. Wade, J. Sanders. W. J. Corboy, Thomas Conway, Robert Griffith, M. L. Mandable, C. C. Breyer, J. B. Breen. T. M. Murphy, A. Murray, W. H. Cummings, A. G. Weber, G. A. Larson, P. M. Murphy, D. Whiteford, T. C. Boyd, J. J. Doyle, James Barret, Robert Lowden, James Meath, T. P. Culloton, Hugh Watt, John Roland, D. M. Quay, J. M. Simpson, W. Dunham, E. Baggot, A. Young. J. H. DeViney, A. H. Watson, J. O'Neil, James Scanlan.

THE NORTHWESTERN MASTER PLUMBERS' ASSOCIATION was disbanded at Oshkosh, Wis., last week, and the State Master Plumbers' Association was or-

ganized. No other business was transacted than to wind up the affairs of the old association and to merge it into the new. The officers elected by the association for the year are: President, Patrick Ryan, Appleton; vice-president, George McCall, Chippewa Falls; secretary, W. S. Patterson, Appleton; treasurer, Charles Hulett, Racine. The plumbers from outside the city who attended the meeting were W. S. Patterson, Appleton; Patrick Ryan, Appleton; Ed. Thomas, Green Bay; Anton Brehme, Fort Howard; John Abearn, Fond du Lac; Michael Murphy, Fond du Lac; Thomas Hamilton, Marinette.

The Hale Basin Waste and Plug.

The accompanying illustration is a sectional view through a basin showing the Hale basin waste and plug offered to the trade by the Dececo Company, 146 High street, Boston, Mass. The particular purpose of this arrangement

Hale Basin Waste and Plug.

is to prevent the spattering of waste water up the overflow and thus fouling its walls and permitting the accumulation of filth, which decomposes and gives off offensive odors in the room. Besides the spattering during the outflow of water the contents of the basin backs up the overflow, thus allowing dirt to accumulate within. This possibility is overcome by the waste and plug shown in the illustration. Referring to the cut it will be seen that the plug part of the device is simply a method of opening and closing the outlet of the basin from the outside. The upright spindle shown at the right of the engraving extends through the marble and terminates in a knob for the hand to raise and lower, the former motion closing the basin plug and the latter motion opening it. Both of the motions are positive, as shown by the illustration. It will be seen that the plug has a cylinder which extends down about 2 inches below the overflow, and is inclosed in a larger cylinder which serves as the waste of the basin. When water passes through the overflow it descends into this larger cylinder through slots in the lock nut. It will be seen that it is quite impossible by this arrangement for the water discharging from the bowl to reach the overflow. The Hale waste is also made for use with a plug and chain, doing away with the plug lifting device illustrated. Either form, however, we understand, can be applied to any of the patent overflow bowls.

Dimensions of a Small Treadle Lathe.

A writer in *Engineering* states that, having had occasion to carry out some experiments of a mechanical nature, somewhat accurate and complex, he needed a treadle lathe to do a fair share of work in iron, brass and wood. It must cut screws in steel up to 40 threads per inch with accuracy, and be back geared for heavy work. The slide rest must be of the compound type, the mandrel hollow, and an index plate must be attached to it. The accessories to be obtained, if possible, from the makers, as time was limited; the tool must be reasonable in price.

The correspondent failed to find a tool meeting all the requirements and of the proper dimensions in stock in either England, Germany or the United States. He therefore advances the following specifications as embracing the main characteristics of a lathe which he thinks would meet a demand already established: Length of bed, 4 feet 6 inches; swing, 9 inches; three-speed cone for 1½-inch belt; mandrel, 1⅞ inches diameter, ¾-inch bore clear through and fitted with spring chucks with draw bar. The back gear would be 6 to 1, and would be placed under the head stock. The tail of the mandrel would extend beyond the back bearing, and have cone and nut for mounting index plates; the mandrel and boxes would be of steel, hardened, ground and lapped. Machine cut gear wheels to cut from 3 to 64 threads per inch, and right and left hand gear in head stock. The compound slide rest would bear for a length of 14 inches on each side of the bed. It would be slotted for T-bolts, and would be fitted with a sliding stay. The width of saddle would not be less than 6 inches. Stop screws would be fitted to each slide. The leading screw, 1 inch in diameter, with V-thread, ten threads per inch, to be attached to slide rest by divided nut 3 inches long. The rod feed would be placed below the leading screw; this would also work the cross feed. The apron would be of the skeleton form in order to observe what is taking place behind it. A machine vise would be fitted to the slide rest, also an angle bracket for placing the compound rest and the vise vertical if desired. A steady rest and T-rests for wood turning would be provided. The tail stock spindle would have a bore of ¾ inch clear through, and its nose screwed similar to the mandrel. The spindle would be arranged for both lever and screw feed, and a small four-hole turret would be made for the same, a similar draw bar to be provided for spindle as in the head stock. There would be a light countershaft provided to drive drilling and grinding attachments to slide rest.

The writer believes that such a lathe could be made to sell for between $150 and $200.

T. Jefferson Coolidge, treasurer of the Amoskeag Mfg. Company, and a leading authority on the New England cotton manufacturing industry, recently gave to a Boston paper his views as to the removal of cotton mills to the South. Labor at the South, he declares, is lower than in the North, the mills are nearer the cotton fields, and there is a large saving in freight charges. Again, Southern railroads take cotton as fifth class freight, while Northern ones take it as second and third class. Then, coal in New England costs $4.50 a ton, while in the South it does not cost more than $1.50. Mr. Coolidge, moreover, was of the opinion that these reasons for the mills moving South were likely to increase rather than otherwise, and he thought, therefore, that the movement Southward, instead of falling off, would grow steadily larger.

A writer in the February *Forum* endeavors to explain the large gold shipments to Europe in addition to the ordinary merchandise balances by showing that the United States owes Europe a large debt which costs us some $350,000,000 a year to liquidate, as follows:

1. For money spent by American travelers abroad, about	$100,000,000
2. For freights carried in foreign ships, about	100,000,000
3. For dividends and interest upon American securities still held abroad, minimum	75,000,000
4. For profits of foreign corporations doing business here, and of non-residents, derived from real estate investments, partnership profits, &c., about	75,000,000
Total	$350,000,000

Last month the H. M. Myers Company, Beaver Falls, Pa., manufacturers of shovels, spades and scoops, turned out the largest product in any one month in the history of the firm, they having made, finished and shipped over 6000 dozen shovels. The firm have all the orders and specifications on hand that they can take care of until May 1, having recently booked a number of large orders for home and export trade.

STOVE TRADE NOTES.

Ohio Stove Trade.

Reports respecting the stove and range industry in this section and adjacent territory are not uniform and may be divided into three classes: those which are unqualifiedly good and encouraging, those which are decidedly dubious, and those which are moderate and temperate in tone, breathing a conservative spirit, reflecting a moderate trade and hope for the future. Of course the experience of one is not the experience of all during a transition period like the present, and the diversity of views is in some respects desirous, exhibiting an individuality which is the life of business success.

Several foundries write that they did not succeed in starting up until near the middle of January after the blowing out due to stock taking and balancing, but that since that time they have been running full. One foundry couples this statement with a comprehensive review of the past month, saying: "Our output for January was 55 per cent. greater than the same month of 1892, and 70 per cent. greater than the same month in 1893 and 1894, between which two years there was a difference in sales of only a few dollars. Our sales of 1894 averaged $100 a month more than they did for 1893." Adding further: "We have more orders on our books now than we ever had at this season. During the last two or three years the trade has opened up a little earlier each year, and the increase in January sales this year may be accounted for, to some extent at least, by this fact, which would naturally make the other spring months drop off a little; so, on the whole, the spring business may average up about as usual."

This view is substantiated by others, even in other States, and while no "boom" is anticipated a steady improvement, based upon fuller employment of the people, results in increased purchasing power and therefore of consumption. Other manufacturers, while noting an evident lack of confidence, are still able to see an improvement and are disposed to gauge business matters by current events at Washington, and the political death of the present Congress on March 4 is awaited with some impatience. Other sections, however, evidently have met with nothing encouraging and can see no improvement in the immediate future. While foundries have been running full time, sales have been 25 per cent. less than in January, 1894, while the number of customers asking for indulgences is increasing and customers are disposed to contract rather than extend purchases. No decided improvement is looked for until fall.

After all is said and done, however, it is evident that there is a general sentiment that there is a gradual return of confidence, and while business may fluctuate the tendency is toward recuperation, and this view is sustained by the larger purchases of pig iron by many foundries and mills.

ODD PLATES.

A MEETING of the creditors of the National Vapor Stove & Mfg. Company of Lorain, Ohio, was recently held in Cleveland for the purpose of reorganizing in the interest of those who purchased the plant at a receiver's sale. A new company was organized with a capital stock of $125,000, the directors being Joseph Collwell. H. B. Hunt, Charles E. Adams, J. B. Sage. Ira B. Bassett, T. A. Reilly and J. A. Reaugh. The Board of Directors elected J. E. Adams president and general manager, H. B. Hunt, vice-president and Joseph Collwell, secretary and treasurer. We understand it is the intention of the company to put the factory at Lorain, Ohio, in operation at once with a full force of men.

IN *The Metal Worker* of January 26 an error was made in stating that Geo. W. Graves was one of the corps of representatives of Eugene Munsell & Co., 128 Water street, New York, their relations having been severed during the latter part of 1894. The house are now preparing to push their line of gas and gasoline stoves. The gas cooking attachment for coal ranges has proven quite popular with the trade. They also have some attractions in mica for stove manufacturers.

ON TUESDAY of this week the plant of the Perry Stove Company, Albany, N. Y., resumed operations with a force of about 75 men.

ONE OF THE HANDSOMEST CALENDARS for the new year that has reached us is that just sent out with the compliments of the Weir Stove Company of Taunton, Mass. Mounted upon very heavy cardboard are two rollers working in metallic journals, one roller being placed near the top of the card and the other an equal distance from the bottom. Upon the rollers is wound a long sheet printed with the different months of the year. Each month is a design in itself, and being printed in colors presents an attractive appearance. The borders of the card upon which the calendar is mounted are embellished with designs of a floral and pictorial character, while across the top is the word "Glenwood," and across the bottom the name and address of the company, with an indication of the line of goods manufactured. Accompanying the calendar is an announcement in the shape of a four-page folder illustrating the Glenwood hot air heater and the Glenwood combination hot air and hot water heater, the latter being made in four sizes and can be furnished with either cast or steel radiator. The company state that they expect to give the trade during the year a number of new and original additions to their already entenslve lines.

THE CHICAGO & ERIE STOVE COMPANY of Erie, Pa., are offering the trade the Rapid Helper six hole range, fitted with their patent oven. The latter is constructed with steel bottom so made as to prevent its buckling. This is accomplished by means of cast iron adjustable braces, so arranged under the bottom oven plate as to prevent it from springing out of shape. By opening the flue door this improvement can be partially examined. The manufacturers state that these patent ovens heat very rapidly and are therefore economical in the use of fuel. Three sizes and many styles of the Rapid Helper are offered, all of which have a special flue strip for soft coal.

AT THE ANNUAL MEETING of the Syracuse Stove Works, Syracuse, N. Y., Francis Kernan was elected president and treasurer; Fred. J. Finck, vice-president; N. E Devereux, secretary and William H. Landers, superintendent.

AT THE ANNUAL MEETING of the stockholders of the Foster Stove Works, Ironton, Ohio, J. D. Foster, C. A. Hutsinpillar, L E. Marting, Charles Alexander, E. Horschel, O. P. Doty and H. A. Marting were elected directors. At a meeting of the board a 5 per cent. dividend was declared and officers for the ensuing year chosen. J. D. Foster was elected president; C. A. Hutsinpillar, vice-president; L. E. Marting, secretary and treasurer, and Charles Alexander, superintendent.

THE 1895 STAFF of traveling salesmen representing the Syracuse Stove Works of Syracuse, N. Y., include the following, who will visit dealers in the territory named: George N. Pickstock in Western New York, Col. R. Daggett in Central New York, C. H. Ingham in Eastern New York, Ed. A. Wilbur in Michigan and Wisconsin, and George M. Eggleston in New York City and the State of New Jersey. The company resumed operations at their works on Wednesday, January 30.

A RECENT VISITOR at the Cincinnati office of *The Metal Worker* was W. E. Anthony of W. E. Anthony & Co., Detroit, Mich., the Michigan and Minnesota representatives of the Portsmouth Stove & Range Company, Portsmouth, Ohio. Mr. Anthony expresses himself as highly gratified with the brilliant reception the Model wrought steel ranges have met with in the territory named.

GEO. W. GRAVES is about to locate at Rochester, N. Y., where he will handle several lines of heating and cooking goods as manufacturer's agent.

THE DIFFERENCES between the Albany, N. Y., molders and the stove manufacturers, which were of a mild character, are reported to have been amicably adjusted. It is probable that all the foundries in the city, which are

busy with annual inventory, will soon be in operation.

THE THATCHER FURNACE COMPANY, 240 Water street, New York, are sending out a blotter calendar for February, so that a reminder of the Thatcher furnaces and ranges and the Champion steam and hot water heaters will be constantly before the trade.

N. H. SQUIRES, Secretary of the Torrance Iron Company, Troy, N. Y., was a recent visitor among the stove trade in New York. The company make a large line of malleable stove trimming and appliances, lifters, shakers, turnbuckles, draft knobs, &c.

FOUNDRIES Nos 1 and 2 of the Reading Stove Works, Reading, Pa., made their first heats since Christmas on January 31. Foundry No. 3, at Orrton, across the river, operated by the same corporation, will also be in operation at an early day. The combined plants of these works give employment to upward of 800 hands.

THE BELLAIRE STOVE WORKS of Bellaire, Ohio are now running half time with a full force, but Manager Johnstown states that the works will be operated on full time about the middle of the month. The outlook is said to be encouraging.

THE WOMEN'S EDITION of the Syracuse *Post* bearing date of February 2, contains various departments covering Finance and Trade, Music, Education, Medicine and Surgery, Religion, Child Life, Physiology, Clubs and Societies, Political Equality, Household Economics and Philanthropy, are all edited by women. The advertisements are of an equally varied character, among the number being that of the J. F. Pease Furnace Company of Syracuse, N. Y. In the space occupied are the opinions from the women of Syracuse concerning the Pease Economy heaters, being, we understand, representative expressions of over 2000 Syracuse women who are using company's heaters and furnaces.

THE MONARCH STOVE COMPANY of Mansfield, Ohio, have issued an exceedingly attractive catalogue of the Monarch stoves and ranges designed for using gas and gasoline as fuels. The publication is known as Catalogue E and consists of 72 pages, profusely illustrated and bound in attractive paper covers with embossed side title, a portion of which is executed in old gold. A feature which tends to give a rich effect to the catalogue is the printing of the pages, the body of each being a delicate brown with white border, while the text appears in black with headlines in blue. The goods shown cover a wide range of gas and gasoline constructions. The opening pages are given up to the Monarch New Method, an artistic creation, fitted with patent vaporizing chambers, Monarch patent sight feed, direct action needle valves made of Tobin bronze, burnished brass burner cylinders with double seamed bottoms and cast heat collars supported by bolting to the top. Following this is the Regal Monarch, a richly treated cabinet range furnished with new high shelf and sub-heating flame; the Monarch range with Russia iron oven and elevated tank; several varieties of the Monarch with burners operated from a single generator; Monarch juniors with single generators and also with individual burners and a varied line of ovens, broilers, burners, &c. Several pages are devoted to repairs and to cuts of the Monarch trade-mark for newspaper and other advertising. The latter portion of the catalogue is given up to Monarch stoves and ranges for gas, these including cabinet and table stoves, hot plates and heaters. Attention is also given to independent connections, burners, rubber tubing, &c.

A NOTABLY HANDSOME PUBLICATION is issued by White, Warner & Co., Taunton, Mass., in the interests of their household ranges. It is a card shaped like a harp, the frame of which carries some dozen gorgeous roses of many varieties. Each blossom has on it the name of the month, and the days of the month are recorded literally *sub rosa*. It is a beautiful piece of coloring and the shading of the different varieties includes all colors between the light tea and the deep red. Those who have been fortunate enough to receive these calendars will see the whole year in rose color, and will begin each month by turning back a lovely blossom.

THE MANY FRIENDS of Secretary Thomas of the National Association of Stove Manufacturers will be glad to learn of a slight improvement in his condition since our last issue went to press. While the change for the better is thus far but slight, there are strong hopes on the part of his physician and family that if the improvement continues through the next few days Mr. Thomas will before long be able to get out.

COL. WILLIAM LOGAN CLARKE, secretary of the Phillips & Buttorff Mfg. Company, Nashville, Tenn., died in that city of typhoid pneumonia on January 19, after a brief illness, at the age of 56 years. He was a business man of exceptional ability and was much respected by his friends and associates. A widow and six children survive him.

H. GILBERT HART of Hart & Crouse, Utica, N. Y., has been spending a few days in Chicago.

THE FOX FURNACE COMPANY of 28 Vincent street, Cleveland, Ohio, state that their business is showing a remarkable increase, giving evidence of the wide popularity of the Fox furnace. The statement is made that the company's business for January, 1895, was three and a half times as great as during the same month in 1894. The company are kept busy, even in February, which is ordinarily a dull month in the furnace business.

RECENT ADVICES from Evansville, Ind., are to the effect that the strike at the works of Kiechle, Brentano & Oberdorfer, has resulted in more or less disturbance. The report states that some non-union molders from Louisville, who were being taken to the foundry, were attacked by the strikers and some of the men badly injured.

THE CARTON FURNACE COMPANY of Utica, N. Y., state that the fire which visited their works on Sunday, February 3, will not in any way interfere with the conduct of their business, as the damage was confined almost altogether to their small foundry. Their duplicate patterns are intact, and with the stock in their storage building the company are in a position to promptly fill orders for any and all sizes and styles of the Carton heaters. Their large foundry, with slight repairs, will be in full operation on Monday, the 11th inst., and the company's new foundry, now under construction, is expected to be ready by March 1. It is interesting to note in this connection that while the fire was in progress on the 3d inst. the company had plans and details for the erection of a new structure, and before the fire was fairly extinguished gangs of men were at work clearing away the *débris*.

The Chicago Drainage Canal.

At a recent meeting of the Board of Trustees the annual reports of the chief clerk and the chief engineer were presented. The financial statement was as follows:

Receipts of the District from organization to December 31, 1893	$5,381,757.78
Receipts for the past year	7,399,367.93
Total Receipts	$12,781,225.71
Expenditures of the District from organization to December 31, 1893	5,186,504.83
Expenditures for the past year	6,292,134.85
Total expenditures	$11,478.639.68
Balance on hand December 31, 1894	$1,302,586.03

The report of the chief engineer reviewed the work from the beginning, and showed the condition of the undertaking at the present time. Since January 1, 1894, nine sections have been equipped and the plant for working them perfected; eight sections have changed hands, and one has been abandoned by the contractors.

On 11 sections only has the work been vigorously prosecuted. In 1895 the work will begin with 28 sections equipped, and much greater progress is predicted, the completing of the work being expected in the fall of 1896. A safe estimate of the value of the machinery used by the contractors is placed at $3,000,000.

The rate of progress of the work reached a maximum in August, when the amount earned by the contractors was $666,481.81, and since then the average has been $568,031.32 per month.

Several plans have been proposed and considered for the controlling works at Lockport, the one combining the greatest advantages and least cost being a combination of lifting gates and a section of bear trap dam. There will be eight of these gates, working between solid masonry piers, the gates being raised vertically by mechanism operated from bridges spanning the space between the piers. Each space will be 30 feet wide and dam 160 feet between bulkheads. The estimated cost is $160,000.

One of the special features noted in the detailed report of sections is the performance of two hydraulic dredges on section B. The two dredges excavated 1,538,387 cubic yards in 882½ working days, or an average of 1731.9 cubic yards per day each. The total removed to January 1, 1895, is 12,608,806 yards of glacial drift and 5,358,968 yards of solid rock, or $48\frac{6}{10}$ per cent. of the glacial drift, $43\frac{57}{100}$ per cent. of the rock and $45\frac{43}{100}$ per cent. of the entire work.

One of the most flourishing cities in the Indiana gas belt is Elwood, which, according to a recent statement, has some 30 large industries, capitalized at $4,350,000 and employing 3270 workers.

The Ohio Falls Car Works have contracted to build 1000 box cars for the Pennsylvania Railroad.

The Manufacture of Tubular Articles.

From United States letters patent issued to C. T. Cayley and R. S. Courtman of London, England, and assigned to the United States Projectile Company of Brooklyn, N. Y., we take the accompanying engravings and present the following description of a method of making tubular vessels or bottles for containing gases under pressure. The vessel is made from a solid block of metal, the various steps in the process of manufacture being illustrated in the drawings, Figs. 1 to 10. Fig. 1 is a view of the solid block, Fig. 2 shows the block after it has been pressed to the shape of the bottom of the mold. Fig. 3 is a sectional view of the block after it has been cupped by the action of a punch. In Fig. 4 the cup has been drawn by one or more operations, while heated, nearly to the length, diameter and thickness of the finished article. In Fig. 5 the cup has been swaged down and closed at one end to enable it to be drawn through a die and over a mandrel as shown. Fig. 6 shows the completed blank, formed from the partly completed blank seen in Fig. 4, by subjecting the latter to a process of cold drawing. Fig. 7 shows a bottle completely formed from the finished blank, Fig. 6. Fig. 8 shows the method of closing the end and Figs. 9 and 10 show the dies used successively in this process.

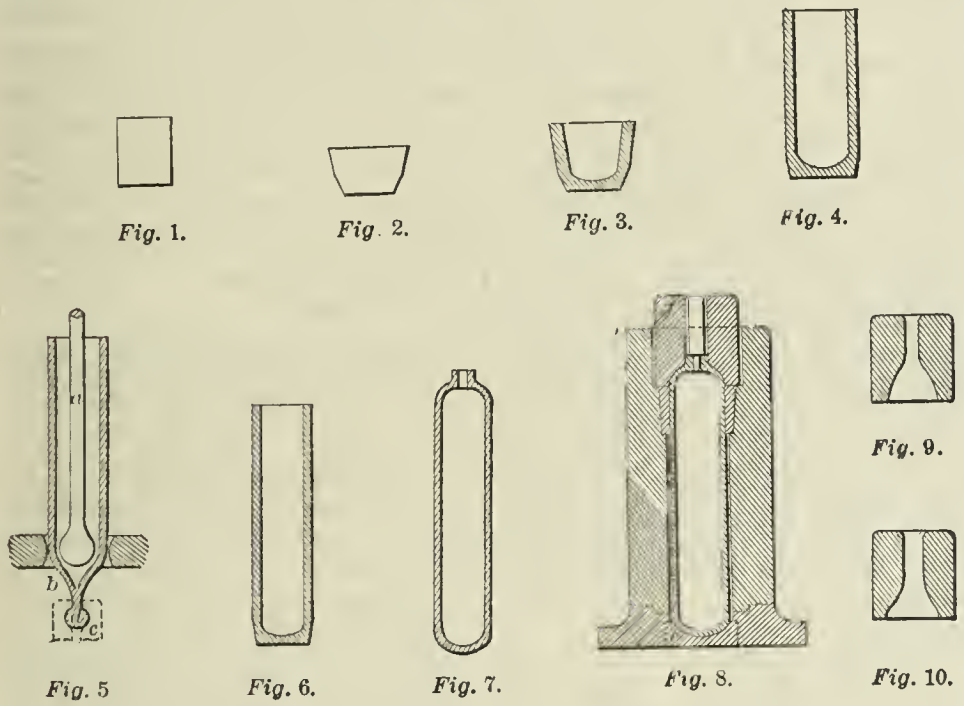


Fig. 1. Fig. 2. Fig. 3. Fig. 4. Fig. 5 Fig. 6. Fig. 7. Fig. 8. Fig. 9. Fig. 10.

METHOD OF MAKING TUBULAR ARTICLES.

The block is first placed in a mold and pressed to the shape shown in Fig. 2, after which, and at the same heat, it is placed in a second mold and by means of a punch is worked into the form of a hollow cup, Fig. 3. The initial tubulation of the metal being thus effected, the cup is placed upon a mandrel and submitted to a process of hot drawing through dies of successively diminishing size, to which the blank is subjected in proper order, being reheated as often as may be necessary. The block has now been brought substantially to the shape shown in Fig. 4. If the blank is to be used in manufacturing a tube about 4 feet or less in length, it may be finished by merely subjecting it to a process of cold drawing by which it is reduced to the proper length and thickness and brought to the exact diameter required, thereby constituting a complete, finished metallic blank, ready for use in the process of manufacture of the complete, finished tubes, bottles, or tubular vessels about to be described.

We take the following description of the process for lengths greater than 4 feet: "If, however, the tube, bottle or tubular vessel is to be of greater length than 4 feet, or thereabout, we can, by known methods, subject the blank described above to the action of rolls, after having punched, cut or otherwise removed its closed end and inserted a mandrel, said rolls having a series of grooves of diminishing size. After reducing it very nearly to the length, diameter and thickness it will have when finished, it is preferably pickled, to remove the oxide, or scale, from its surface, is then subjected to an annealing process and finally finished by cold drawing. By the latter process we are enabled to reduce the metal to any required thickness, however slight, and we impart to it great strength, stiffness and toughness. We may use for this cold drawing process any known method, but we prefer that illustrated in Fig. 5 of the drawings. This method consists, substantially, in closing and swaging or shaping the end *b* of the tube in such manner as to form thereon a strong, prolonged neck, or shank, 4, provided at its extremity with a knob or other suitable holding device, *d*. This device is placed within the grasp of jaws *c*, reciprocated by any suitable means. Within the tube we insert a mandrel, *a*, having upon its end a ball of such size as to impart the proper interior diameter to the tube. The exterior diameter is imparted by means of a circular die, having its edge convex, or rounded, and lying in suitable position with relation to the interior device *a*. The cold drawing may be completed at a single operation, or it may be effected by repeatedly drawing the tube, the diameter of the die and mandrel being slightly diminished at each operation. By this process we produce not only tubular blanks suitable for the manufacture of bottles or tubular vessels capable of holding gases under pressure, but we can also form tubing sections of any suitable or ordinary length, diameter and thickness.

"In the manufacture of blanks for the production of bottles we operate upon a solid block of steel or iron by substantially the same method as that described until it is reduced to the form shown in Fig. 6, the blank being of a length somewhat in excess of that of the bottle when the latter is finished. We then cut off the surplus length from the upper or open end of the tube, and turn or otherwise shape the bottom or closed end, to bring it to the required shape and thickness. The open end of the blank is then heated and placed in a mold, Fig. 8, in which the open end of the blank is to be closed and its neck formed. At the lower end of the mold is a block, *e*, to support the blank against the action of the die *f*, or dies, Figs. 9 and 10. These dies, when more than one are used, operate successively, preferably by hydraulic pressure. The matrix recess in each die is successively approximated to the complete or finished shape, until the last is reached, which imparts the necessary form. The matrix recess in each die opens into a concentric bore having a form adapted to receive and aid in forming the neck of the bottle, this operation being completed by the use of a mandrel having a reduced end, which is passed down through the bore 17 in the die to form the opening in the neck which is to receive the valve."

The United States Projectile Company of Brooklyn are using the process in the manufacture of bicycle tubing, using special Swedish steel billets.

One of the largest pieces of bronze casting ever made in the United States was shown lately in the foundry of A. T. Loome, in New York City. It is a statue of the late Major-General Devens of Massachusetts, the work of Olin L. Warner. The figure, which is 9 feet 6 inches in hight, was cast in one piece, the arms only being separate. It represents the deceased soldier in the uniform of the United States army, and is dignified in treatment, the workmanship of the draperies being particularly excellent. The statue is a commission from the city of Boston, where it is to be erected. The St. Gaudens statue of Peter Cooper, to be placed in front of the Cooper Institute, which was also cast by Mr. Loome, is now completed and will shortly be placed in position. The figure is represented seated and was cast in two pieces, over 6000 pounds of metal being used in its construction.

The whaleback steamer "Pathfinder" and her consort "Sagamore," have broken all records for the number of round trips made by a steamer and consort during the season. Since leaving Chicago on April 5 last the "Pathfinder" and "Sagmore" have made 24 round trips, 22 of these being from Duluth to Ohio ports with iron ore. In all, the two boats have carried about 120,000 gross tons of iron ore, 9000 tons of coal and 500,000 bushels of grain. These two vessels are part of the Minnesota Iron Company's fleet. At average current rates, their gross receipts for the season must have been about $95,000 for ore, $7500 for grain and $1800 for coal.

The New York State Superintendent of Public Works, in his annual report, says that the time is fast approaching when operation of the canals of the State in a practical manner must cease unless the canals are improved so that the business done thereon can be done at a profit to the boatmen.

TRADE REPORT.

The Iron Market.

Pig Iron.—The New York market is without important change. Consumers purchase indifferently and orders are chiefly for moderate quantities to be delivered within a short time. The offering is much the same as it has been for some time past, with competition keen, particularly on the lower grades of Iron. Prices have not varied greatly, but the market is still rather weak. We quote $12 @ $12.50 for No. 1; $11 @ $12 for No. 2, and $10.50 @ $11 for No. 2 Plain, standard brands, tidewater delivery. Southern Iron, same delivery, is selling at $11.25 @ $11.50 for No. 1; $10.25 @ $11 for No. 2; $10 @ $10.50 for No. 3; $10.25 @ $10.75 for No. 2 Soft, and $10.50 @ $10.75 for No. 1 Soft. Foundry No. 4 (Foundry Forge) is $9.50 @ $10.

Taking everything into consideration it may be said, as regards Philadelphia, that the Pig Iron market is better than it was a week ago. There is more business being done, there is more inquiry, and prices, while not quotably dearer, are firmer and in some cases fractionally higher. Consumers are not taking large lots, however, although in the aggregate sales during the past week have been quite heavy. The foundry trade seems to have got fairly to work after several weeks shut down, and as they were all bare of stock buying has been a necessity, and will continue to be so in case orders come in as expected. Sales have been at all sorts of prices, varying according to quantity, point of delivery and grade of Iron required. The lowest for Philadelphia would be at the following inside figures, and from that upward, with 20¢ @ 30¢ less for all grades delivered at Harrisburg, York, Baltimore, &c.:

Standard No. 1 Foundry X	$12.00 to $12.50
Standard No. 2 Foundry X	11.00 to 11.50
No. 2 Plain	10.75 to 11.00
No. 1 Soft	11.50 to 11.75
No. 2 Soft	10.75 to 11.00

Chicago advices indicate that local Iron has been in better demand the past week in that market. One contract of 1000 tons was entered and a good number of small sales were made. Shipments on old orders are increasing, as consumers find that they require much more material than was expected. Foundrymen are carrying no stocks in their yards and are constantly urging more prompt shipment from the furnaces. Sales of about 2000 tons of Southern Iron are reported in various lots, but the only character of Southern Iron in demand is soft grades. Prices appear to be firmly maintained. Lake Superior Charcoal is quiet. Quotations are as follows, for cash:

Lake Superior Charcoal	$13.00 to $14.00
Local Coke Foundry, No. 1	10.25 to 10.50
Local Coke Foundry, No. 2	9.75 to 10.00
Local Coke Foundry, No. 3	9.50 to 9.75
Local Scotch	10.50 to 11.00
Ohio Strong Softeners, No. 1	12.50 to 13.00
Southern Silvery, No. 1	11.50 to 11.75
Southern Silvery, No. 2	11.25 to 11.50
Southern Coke, No. 2	10.00 to 10.50
Southern Coke, No. 3	9.75 to 10.25
Southern, No. 1, Soft	10.25 to 10.50
Southern, No. 2, Soft	9.75 to 10.25
Alabama Car Wheel	17.50 to 18.00
Jackson County Silvery	15.50 to 16.00
Other Ohio Silvery	14.25 to 14.50

In the Pittsburgh district the week has been without special features. There is only a limited demand for Foundry Iron, and prices depend largely upon the size of the order and the conditions surrounding it. We quote as follows, for cash:

No. 1 Foundry	$10.50 to $10.65
No. 2 Foundry	9.75 to 10.00

Several encouraging features have been developed in the Cincinnati Pig Iron situation during the past week and an increased volume of business has been transacted. Between 15,000 and 20,000 tons of Iron have been sold by local factors for distribution to diversified interests, extending over one to four months in delivery. Quite a number of mills as well as foundries of various kinds have been in the market and the freer purchases indicate either more confidence in the Metal market or increased orders for finished product making it necessary to cover contracts. Probably both these facts and opinions have influenced purchases. On the other hand, while furnaces are still taking orders at current quotations, it is evident that they have a firmer feeling and are more encouraged respecting the near future. At the close there are a number of buyers in the market and several important transactions are pending. Quotations are without essential change; transactions, as a rule, are based more upon inside than outside quotations, but the tone of the market is a little harder at the close. Quotations are given as follows:

Southern Coke, No. 1	$9.75 to $10.00
Southern Coke, No. 2	9.00 to 9.25
Southern Coke, No. 3	8.50 to 8.75
Ohio Soft Stoue Coal, No. 1	14.50 to 15.00
Ohio Soft Stone Coal, No. 2	14.00 to 14.50
Lake Superior Coke, No. 1	11.75 to 12.25
Lake Superior Coke, No. 2	10.75 to 11.50
Hanging Rock Charcoal, No. 1	16.00 to 16.50
Hanging Rock Charcoal, No. 2	15.50 to 16.00
Tennessee Charcoal, No. 1	13.00 to 13.50
Tennessee Charcoal, No. 2	12.00 to 12.50
Standard Southern Car Wheel	15.75 to 16.75
Lake Superior Car Wheel and Malleable	14.25 to 14.75

The St. Louis Pig Iron market is if anything less favorable than when last reported. Sales are reported as small, and consumers are all restricting their purchases to limited quantities, with the possible exception of the local Pipe works, who have bought between 5000 and 6000 tons since the first of the year. Prices are weak and appear top heavy. No. 2 Foundry is quoted at $6.75, f.o.b. cars Birmingham, and this price has been shaded in some cases. The general situation is anything but encouraging. We quote as follows for cash, f.o.b. cars St. Louis:

Southern Coke, No. 1 Foundry	$10.00 to $10.25
Southern Coke, No. 2 Foundry	9.50 to 9.75
Southern Coke, No. 3 Foundry	9.00 to 9.25
Southern Car Wheel	16.00 to 16.50

CONTRACTORS in Pipe Fitting will find at the works of the Eastwood Wire Mfg. Company, Belleville, N. J., a full line of Perfection Bronze Fittings such as are used in connection with digesters of paper mills and chemical works. The company are also prepared to furnish Perfection Bronze Castings up to 9000 lb in weight. They are now at work on an order for 5-inch Flange Cocks for use in a chemical plant.

Metal Market.

Pig Tin.—Spot stock has been under close control throughout the week, and prices have been held at a sharp premium over those at which contracts for the current month were sold and more or less freely offered. The premium was due to the fact that the concentration of spot supply in the hands of a few dealers left little available Tin elsewhere for speculative purposes. The market closed quiet but firm. Retail business has been moderate, with prices for small lots of Straits from store unchanged at about 15¢ ℔ lb. for Pig and 16¢ for Bar. The visible supply on the 1st inst. is computed at 24,546 tons, against 24,614 tons on January 1. Of this amount 1594 tons was on the spot here and 3200 tons afloat for this country. London had 10,157 tons spot and 4420 tons afloat. The balance consisted of Continental holdings and stock afloat for that quarter. Compared with a year ago, the visible supply shows an increase of about 7000 tons.

Copper.—Business has been rather slow and prices have weakened slightly under the influence of freer offerings of some brands for both prompt and near future delivery. The severe weather has interfered somewhat with the demand for both Ingot and Manufactured Copper. Small lots of Lake Ingot from store are quoted at 10½¢ ℔ lb.

Pig Lead.—The market has been remarkably steady. No fluctuation to speak of in prices has taken place. Buying interest has not been at all brisk, but the demand increased somewhat the past few days and about 400 tons were sold, chiefly for early delivery. The situation at the primary sources of supply is regarded as strong statistically. No noteworthy improvement has developed in the demand from small consumers, who are buying very indifferently. Retail prices for small parcels of American Pig rule at 3¼ @ 3⅝¢ ℔ lb.

Spelter.—In sympathy with reduced cost at the West the market here has weakened further, and is at present in poor shape. The lower prices have stimulated buying to a very moderate extent only. Prime Western brands in small parcels are quoted at 4¢ @ 4¼¢, with inferior brands at slightly lower prices.

Antimony.—About the usual jobbing business is passing. Prices on small lots remain steady at 9¼¢ @ 9½¢ ℔ lb for Cookson's and 8¢ for Hallett's.

Tin Plate.—Very low prices have served to keep up a fairly live interest in Cokes for future delivery. Otherwise the market has been "flat, stale and unprofitable." Spot business, which is still moderate and of a hand to mouth character, has been seriously contracted by the severe weather prevailing in this section, which has effectually stopped all out of door work. Prices are still more or less weak, with a slight decline quoted in some lines.

Stocks in jobbers' and importers' hands are good and the assortment fair. Production on the other side has been materially reduced through the closing down of about 50 % of the Welsh works. On the other hand the domestic producing capacity is increasing rapidly by the starting up of American plants under the new wage agreement.

A special London cable dispatch of February 6, to *The Iron Age*, reports on the British Tin Plate market as follows: In Tin Plate there has been scarcely anything doing. Buyers decline to operate beyond small orders in hand. There is less American inquiry. Bessemer Cokes have been pressed for sale at as low as 9/ without finding buyers and Siemens are offered at 9/4½. Quotations f.o.b. Wales are given as follows:

Bessemer Cokes, IC 14 x 20.....	9/	@	9/1½
Siemens Cokes, IC 14 x 20.....	....	@	9/4½
Ternes, 20 x 28.....	18/	@	23/
Charcoals, IC 14 x 20.....	10/6	@	13/

Sheet Iron.—The movement in both Black and Galvanized Sheets has been moderate during the week under review. The jobbing demand has been restricted by the severity of the weather. Manufacturers' agents say, however, that a good deal of inquiry is coming in from the larger consumers, who are anxious to close for their spring and early summer requirements, being evidently satisfied that it is a good thing to buy at present prices. Jobbers' quotations for small lots of No. 27 Common Iron from store are about 2.65¢. Galvanized Sheets in small lots rule at 75 and 5 % @ 75 and 10 % off.

Trade Notes.

THE SWARTS METAL COMPANY, of which S. Swarts is president, have opened an office and salesrooms at 120 West Lake street, Chicago. They are manufacturers, jobbers and exporters of Metals, handling high grade Babbitt, Solder, Stereotype and Electrotype Metal, Pig Lead, Pig Tin, Copper, &c. They will shortly issue an illustrated catalogue describing different grades of Metals and Alloys.

THE CONNECTICUT PLATING COMPANY, 217 North Tenth street, Philadelphia, are calling the attention of the trade to their facilities for Electro Plating in gold, silver, nickel and other metals, and state that they are especially equipped for Electro Bronzing heavy castings for architectural and other works.

THE HUGHES-TAYLOR CAN COMPANY, Baltimore, Md., have been incorporated by Charles J. Hughes and Henry C. Winebrenner with $30,000 capital.

THE OLIVER SHEET IRON MILLS, Easton, Pa., which have been idle for several years and which have been recently put in repair, will, it is announced, be put in operation with a large number of hands in a few days.

Gustaf von Leibhaus, a German official, is now in the United States inspecting the sewerage systems of American cities for the purpose of reporting thereon to the Berlin authorities. He regards the Washington system as superior to that of New York, Philadelphia or Baltimore. The sewerage system of Paris, he believes, leads the world.

CONDITION OF THE

Hardware Trade.

IT IS GRATIFYING to hear from many who have made a careful comparison of January, 1895, with that of 1894 that the present year begins with greater promise than did the last. A number of merchants and manufacturers advise us that not only have they sold a greater quantity of goods during the past month than a year ago, but that the value of goods is greater. This is certainly an encouraging feature considering the fact that goods are probably from 20 to 25 per cent. cheaper. Orders are reported to be coming in more freely, and it is evident that trade is gradually improving. The severe weather which has prevailed in many parts of the country has, however, had, and still has, the effect of retarding the demand. Careful buyers are watching the market closely and note with interest the improved tone in Wire Nails, Barb Wire and some other goods that lie near the raw material and on which prices have been exceptionally low. The advances which have taken place have a good effect on the tone of the market, though as yet there has been no general strengthening of prices, which continue on many lines weak and irregular, lower quotations being made than ever before. In this condition of things the trade are naturally reluctant to place orders beyond their requirements, unless it be in a few cases where the buyer is confident the lowest prices have been reached and that it is a safe policy to order. There is, however, comparatively little of this, as prices have for so long a time been tending downward that it is a question with many as to whether or not a turn may be expected in th near future.

Advices from Chicago.—The volume of business in Shelf Hardware is not so large as it was. The extremely cold weather, the worst known in this section for years, has been of such prolonged duration that it interferes seriously with outdoor work and has cut off the demand for important classes of material. Seasonable goods for spring delivery are in fair request, and staple goods are doing well when they can be had at the low prices recently made by the large jobbing houses. A remarkably strong demand is noted for Stamped, Pieced and Japanned Tinware. Jobbers are having much difficulty in keeping up their stock and are buying from each other in order to meet the requirements of their customers. Aluminum Goods are also going remarkably well considering the comparative dullness of this ware. Numerous inquiries for Tinners' Tools and Machines are now coming forward, more than for three years past, showing that people are again starting into business. This is taken as a strong indication that confidence is being restored among the people at large. Heavy Hardware is in fair condition with a healthy movement, although the volume is not as large as jobbers would like to see. Everything taken is going at once into the hands of consumers and any increase in consumption is therefore perceived immediately.

Notes on Prices.

Wire Nails.—The improvement referred to in our last issue still holds, the market being firm with an active demand and the order books of the manufacturers well filled. The tone of the market is decidedly firmer and prices are well maintained. There is an active demand coming in from the larger and the smaller trade, and all indications point to the fact that stocks in the hands of the trade generally are exceptionally light. At the same time it is pointed out by the manufacturers that the production of Nails is considerably less than it was a year ago and in their opinion the demand will easily take care of all the goods which can be manufactured during the current half year.

Advices from Chicago.—Manufacturers maintain the firm position noted last week. Large inquiries are in hand, some for delivery running up to the opening of navigation. Jobbers have not advanced their prices, some continuing to sell at 95 cents, while others ask $1 to $1.05.

Cut Nails.—The Cut Nail market continues without important change. Small lots from store, New York, are quoted at 90 cents. The volume of business is moderate and the tone of the market slightly irregular.

Advices from Chicago.—Manufacturers report only a moderate trade at unchanged prices. Jobbers sell small lots from stock at $1.

Barb Wire.—In our last report we referred to the slightly better feeling in the Barb Wire market, without, however, a quotable advance. During the past week there has been a still further improvement and prices are a little higher. Small lots from store in New York are held at $2.15 to $2.20. There is an increasing demand, and the outlook for the season's business is promising.

Advices from Chicago.—A large trade is in progress, which is particularly heavy to the Southwest. Texas and the Indian Territory appear to be the points now developing the strongest demand. Prices are fairly firm, but it is stated that some concessions are being made to secure as large a share of the Southwestern business as possible. The demand in this immediate vicinity is about as it has been, some jobbers reporting a good run of orders for spring delivery. The general demand for Wire products is steadily increasing and the leading establishments expect to be crowded to their utmost capacity to meet the requirements of their customers in March. Jobbers' quotations range from $1.55 to $1.65 for carloads of Painted and $1.90 to $2 for Galvanized.

Shot.—An advance of 5 cents in the price of Shot is announced under date January 30. The following are the revised prices, terms net 30 days, or 2 per cent. discount for cash in 10 days, a discount of 5 cents per bag (25 pounds), and a special discount of 2½ per cent. being allowed on lots of one ton and upward, bought, invoiced and paid for at one time:

Drop Shot up to B, 25-pound bag.....	$1.15
" " 5 "	.30
Buck Shot, 25-pound bag.....	1.40
" 5 "	.35
Chilled Shot, 25-pound bag.....	1.40
" 5 "	.35
Dust Shot, 25-pound bag.....	1.75
" 5 "	.40

Bright Wire Goods.—The market for Bright Wire Goods has recently been showing evident marks of weakness, and prices are lower. There is, however, a good deal of irregularity in the quotations named by the different manufacturers, some of whom refrain from pressing their goods in view of the still lower prices of their competitors.

Wrought Goods.—The market for Wrought Goods is in an unsatisfactory, unsettled and somewhat demoralized condition, prices generally being low and very low quotations being made by some manufacturers. The lowest prices current are, it is understood, on goods of inferior quality and light weight. It will be worth while for the trade to look carefully into the quality of goods in this line, as well as prices at which their orders are accepted.

Wrought Iron Pipe.—The Wrought Iron Pipe and Tube Manufacturers' Association met at the Monongahela House, Pittsburgh, on Tuesday and Wednesday of last week, this being the first meeting of this organization held for some months. Sixteen firms were represented in person, as follows :

AMERICAN TUBE & IRON COMPANY, Middletown, Pa., and Youngstown, Ohio.
A. M. BYERS & Co., Pittsburgh, Pa.
CONSHOHOCKEN TUBE COMPANY, Conshohocken, Pa.
DUQUESNE TUBE WORKS COMPANY, Pittsburgh, Pa.
SPANG, CHALFANT & Co., Pittsburgh, Pa.
NATIONAL TUBE WORKS COMPANY, McKeesport. Pa.
OIL CITY TUBE COMPANY, Oil City, Pa.
OIL WELL SUPPLY COMPANY, Pittsburgh, Pa.
MORRIS, TASKER & Co., INC., Philadelphia, Pa.
PENNSYLVANIA TUBE WORKS, Pittsburgh, Pa.
THE PITTSBURGH TUBE COMPANY, Pittsburgh, Pa.
RIVERSIDE IRON WORKS, Wheeling, W. Va.
WESTERN TUBE COMPANY, Kewanee, Ill.
COHOES TUBE COMPANY, Cohoes, N. Y.
SYRACUSE TUBE COMPANY, Syracuse, N. Y.

Frank J. Hearne of the Riverside Iron Works, Wheeling, W. Va., was chairman, and Joseph Brown of Pittsburgh secretary. The object of the meeting was to consider the advisability of advancing prices on Pipes and Tubes and to take any other action that would improve the condition of this industry, which has been unsatisfactory for some time. After a thorough discussion it was resolved to rearrange the lists and discounts on Pipes and Tubes and to make slight advances in prices. We give below the new lists and discounts adopted, as follows:

Wrought Iron Pipe, Butt Welded.

Diam. inches.	Black.	Galv'd.	X strong.	XX strong.
⅛	$0.05½	$0.08	$0.11	$0.22
¼	.05½	.07½	.11	.22
⅜	.05½	.07½	.11	.22
½	.07	.09½	.14	.28
¾	.08½	.11½	.17	.34
1	.11¾	.16	.23½	.47
1¼	.15½	.22	.31	.62

From the above list the manufacturers announce a discount of 70 per cent. on Butt Welded Pipe, Black, and 64 per cent. discount on Butt Welded Pipe, Galvanized.

Wrought Iron Pipe, Lap Welded.

Diam. inches.	Black	Galv'd.	X strong.	XX strong.
1½	$0.26	$0.31	$0.52	$1.04
2	.35	.42	.70	1.40
2½	.52	.62	1.04	2.73
3	.68	.80	1.36	3.57
3½	.81	.96	1.62	4.25
4	.95	1.16	1.90	5.00
4½	1.25	1.50	2.50	6.56
5	1.42	1.75	2.84	7.45
6	1.85	2.20	3.70	9.25
7	2.45	3.00	4.90	12.25
8	2.95	3.70	5.90	14.75
9	3.75	....	....	.....
10	4.75	....	....	.....

Referring to the above list the association determined on the following discounts: On Black Lap Welded Pipe, 77 per cent.; on Galvanized Lap Welded Pipe, 68 per cent.

Standard Boiler Tubes.

Size O. D.	Price.	Size O. D.	Price.
1	$0.37	4½	$0.69
1¼	.35	5	.82
1½	.32	6	1.08
1¾	.32	7	1.33
2	.30	8	1.70
2¼	.32	9	2.25
2½	.36	10	2.76
2¾	.39	11	3.30
3	.39	12	3.77
3¼	.45	13	4.43
3½	.48	14	5.04
3¾	.55	15	5.87
4	.60	16	6.50

On sizes of Boiler Tubes from 1-inch to 2¼-inch a discount of 75 per cent. is announced, and on larger sizes from 2½ inch to 16-inch a discount of 77½ per cent.

Lap Welded Casing.

Nom. I. D.	Nom. O. D.	B.W. G.	Price.	Weight.	Threads.
2	2¼	13	$0.24	2.22	14
2¼	2½	12	.26	2.82	14
2½	2¾	12	.27	3.13	14
2¾	3	12	.29	3.45	14
3	3¼	11	.32	4.10	14
3¼	3½	11	.35	4.45	14
3½	3¾	11	.37	4.78	14
3¾	4	10	.43	5.56	14
4	4½	10	.46	6.00	14
4¼	4½	10	.50	6.36	14
4¼	4½	6	.67	9.38	14
4½	4¾	10	.52	6.73	14
4½	4¾	6½	.67	9.39	14
4¾	5	9	.58	7.80	14
5	5¼	9	.61	8.20	14
5	5¼	7	.71	9.86	14
5	5¼	4	.87	12.80	11½
5	5¼	1	1.06	15.88	11½
5 3/16	5½	9	.63	8.62	14
5 3/16	5½	5	.84	12.49	11½
5⅝	6	8	.73	10.46	14
5⅝	6	6½	.83	12.04	11½
5⅝	6	4½	.95	14.20	11½
5⅝	6	2½	1.13	16.70	11½
6¼	6⅝	8	.85	11.58	14
6¼	6⅝	6½	.97	13.52	11½ 14
6¼	6⅝	3½	1.18	17.02	11½
6⅝	7	8	.93	12 34	14
6⅝	7	4	1.27	17.51	11½ 10
7¼	7⅝	8	1.06	13.55	14
7⅝	8	7	1.22	15.41	11½
7⅝	8	4	1.53	20.17	11½
8¼	8⅝	7	1.25	16.07	11½
8¼	8⅝	5	1.56	20.10	11½
8¼	8⅝	2½	1.86	24.38	11½ 8
8⅝	9	7	1.51	17.60	11½
9⅝	10	6	1.80	21.90	11½
10⅝	11	5	2.13	26.72	11½
11⅝	12	4½	2.42	30.35	11½
12½	13	3½	2.95	33.78	11½
13½	14	2½	3.48	42 02	11½
14½	15	2	4.15	47.66	11½
15½	16	2	4.57	51.47	11½

The discounts relating to the above list as announced by the association are as follows:

	Per cent.
Screw and socket joint casing	65
Inserted joint casing	60

In connection with the foregoing it will be understood that additional discounts are allowed by the manufacturers to the large buyers and to the jobbing trade. It is stated by the manufacturers that a determined effort will be made to sustain the advanced prices. Manufacturers present at the meeting reported a considerably larger demand at present than is usual at this season, and the outlook for the future is regarded as very encouraging.

Lawn Mowers.—There are many indications that a large business will be done during the present season in Lawn Mowers. The market is, however, in a somewhat unsatisfactory condition. On the cheaper machines very low prices are being made, while on the better grades the market has a better tone. In view of the unprofitable prices prevailing on goods which are without recognized position some of the manufacturers have withdrawn from the market for the present, but with increased facilities on the part of their competitors and new concerns in the field the supply of machines is ample and competition active.

Philadelphia Lawn Sprinkler.—This Lawn Sprinkler was described in *The Metal Worker*, January 26, as manufactured by the Philladelphia Lawn Mower Company, Philadelphia. The Sprinkler is sold from the following list, which is subject to a discount of 33⅓ per cent., f.o.b. Philadelphia:

	Each.
No. 1	$1.00
No. 2	1.25
No. 3	2.00
No. 4, with turtle back	7.00

Columbian Enameled Steelware.—We are advised by the Bellaire Stamping Company, Harvey, Ill., that they have made a reduction in the price of their Columbian Enameled Steelware for the season of 1895.

Grip Wire Stretcher.— Grip Wire Stretcher, put on the market by W. C. Heller & Co., Montclair, N. J., is priced at $3 per dozen, subject to a discount of 50 per cent.

Glass.—Within the past week or two there has been a decrease in the American Window Glass productive capacity of the country equivalent to about 70 pots. This has been caused by factories going out of blast for repairs, and they are likely to remain idle for two or three weeks. The impression prevails that shut downs, ostensibly for repairs, will become more common, as orders are now pretty well filled and present prices offer little or no inducement for stocking Glass at factories. It is expected that the amount of Glass made will gradually decrease until prices and demand offer additional incentives to production. The New York market is represented by the following quotations: In small lots, 85 and 15 per cent. discount for single and 85 and 20 per cent. discount for double strength Glass. Further reports have come to hand regarding the new arrangement among the American Plate Glass manufacturers, to which reference was made in our issue of January 10, 1895, which indicate that the properties of the several Plate Glass companies will be sold to a corporation upon a basis of $10,000,000

Old Metals.—Business is only fair and prices are barely steady. The following quotations represent the current rates paid by dealers in this city:

Heavy Copper	℔ 7 ¢
Light and Tinned Copper	℔ 6½¢
Heavy Brass	℔ 4¾¢
Light Brass	℔ 3¾¢
Lead	℔ 2¾¢
Tea Lead	℔ 2½¢
Zinc	℔ 2⅛¢
No. 1 Pewter	℔ 10 ¢
No. 2 Pewter	℔ 5½¢
Wrought Scrap Iron, ℗ gross ton	$7.50 @ $8.00
Heavy Cast Scrap ℗ gross ton	7.50 @ 8.50
Stove Plate Scrap	℗ gross ton 5.00
Burnt Iron	℗ gross ton 3.00

Old Rags, Paper, &c.—Demand is fair and dealers' purchasing prices substantially the same as those quoted last week, namely:

No. 1 White Rags	℔	3	@ 3¼¢
No. 2 White Rags	℔	2¼	@ 2⅛¢
Mixed Rags	℔	¾	@ 1 ¢
Blues and 3ds	℔	1⅛	@ 1⅜¢
Hard Sized White Shavings	℔	2⅛	@ 2¼¢
No. 1 White Book Shavings	℔	1¾	@ 2⅛¢
No. 2 White Book Shavings	℔	1	@ 1⅛¢
Light Book Shavings	℔		⅝¢
No. 1 Mixed Shavings	℔	⅞	@ 1 ¢
No. 2 Mixed Shavings	℔	⅝	@ ¾¢
No. 1 Printed Books	℔	1	@ 1¼¢
Ordinary Mixed Books	℔	½	@ ¾¢
Newspapers	℔		2·5¢
No. 1 Manila Paper	℔	¾	@ 1 ¢
No 2 Manila Paper	℔	⅝	@ ¾¢
Bogus Paper	℔		½¢
Common Paper	℔	¼	@ 3·5¢
Straw Chips	℔		⅝¢
Binders' Clippings	℔		½¢
Jute Butts	℔	1½	@ 1¾¢
No. 1 Jute Bagging	℔	1	@ 1¼¢
Mixed Bagging	℔	¾	@ 1 ¢
No. 2 Bagging	℔	½	@ ¾¢
Hemp Twine	℔	2	@ 2¼¢
Manila Rope	℔	2	@ 2¼¢
Jute Rope	℔	1½	@ 1¾¢
Mixed Rope	℔	¾	@ ⅞¢

Old Rubber.—The following quotations represent about the prices paid by dealers, New York delivery:

Car Springs, ton lots, ℔ lb.	$0.03¾ @ .04
Rubber Shoes, carloads, delivered at factory, ℔ lb.	@ .05¼
Rubber Shoes, less than carloads, ℔ lb.	@ .04¾
White Wringer Rolls, ℔ lb.	@ .03⅞
White Syringes, ℔ lb.	@ .03⅞

In a Special Notice on another page the John W. Ealy Company call particular attention to their "tracer," which is designed to give information to the subscriber as to the history, credit, standing, &c., of his customers, or those who are prospective customers. The success with which the "tracer" accomplishes this is emphasized. The company also state that in addition to the "tracer" report they are in a position to give all the benefits that any other mercantile agency can furnish, including a reference book of credits, semi-annually issued in January and July. This "blue book" contains a complete classified list of names, with the financial worth and pay ratings of merchants, manufacturers and dealers throughout the United States and Canada in Hardware, Stoves, Tinware, Plumbing and House Furnishing Goods.

Fire at A. Stevenson's Brass Works, 531 West street, New York City, caused heavy damage on February 7.

C. F. Evans, for many years with the C. W. Evans Company and latterly with the firm of Evans & Robertson, Cincinnati, Ohio, with associates, under the name of the C. F. Evans Steel & Iron Company, with office at 50 Carew Building, Cincinnati, have just completed arrangements whereby they will represent Iron and Steel and kindred productions in Cincinnati and the territory tributary thereto.

As a result of the conferences between President Wilson of the Board of Health of New York and Street-Cleaning Commissioner Waring, President Wilson announced that several amendments to sections 95 and 96 of the Sanitary Code would be acted upon by the board next week. It is thought that the proposed amendments will be adopted. All receptacles required by one section must comply with the following conditions, viz., to be of iron, either painted or galvanized; of cylindrical form, not more than 21 inches in diameter and 36 inches in hight, with two handles on the upper part, and metal cover; to have the name of the street and the number of the house marked in plain letters thereon; to be kept clean and inoffensive, and in good order, both inside and outside, when empty. The proposed amendments provide for a uniform receptacle, and eliminate the words "box, barrel and tub."

Eugene Kulinski & Co., 93 Thompson street, New York City, have just completed two wrought iron gates for the new City Hall, at Philadelphia, which are among the most massive and elaborate specimens of artistic hammered iron work ever produced in this country. The gates, which will stand in front of the Select and Common Council Halls of the Quaker City, are made from designs by W. B. Powell of Philadelphia. They are in the Renaissance style, light and graceful in appearance and profusely ornamented, yet strong and massive, each gate, with its immediate frame work, weighing 3 tons. The gates and adjuncts are each 18 feet wide and 15 feet high, and there is not a casting in the whole fabric. Every portion, to the minutest detail, has been hammered out of Swedish iron and American mild steel. The workmanship of the gates is exquisite, and they form a noteworthy addition to the beautiful examples of American art in iron which now adorn most of the great cities of the United States.

The receivers of the American Water Works Company, Omaha, Neb., have discovered that the plumbers in that city have been connecting houses with the water supply without informing the company, and claim that the company lost $1000 per month. Some of the plumbers have been cited to appear before the court to explain their action.

The first train passed, on February 1, through the new Belt Line tunnel of the Baltimore & Ohio Railroad in the city of Baltimore. The tunnel, which is 6 miles in length, was built at a cost to the railroad of $7,000,000. It has been in course of construction for four years. The company have contracted for electrically driven locomotives for taking trains through the tunnel, and it is expected that the new motors will be at work by April 1, after which no more steam engines will be permitted to enter the tunnel. It will be of value to the Baltimore & Ohio road, as obviating the ferrying of trains across the bay at Canton. Passenger trains between Washington and New York will by its means save from 20 to 30 minutes on their present schedule.

Gen. Austin Lathrop, Superintendent of State Prisons, in his annual report to the New York State Legislature for the fiscal year ended September 30, 1894, urges the pressing necessity of making some provision for the employment of convicts, who, under the new State constitution, are prohibited from working at any industry whereby they may come into competition with free labor.

The first ingot for the Russian armor plate contract was cast on Saturday at the Bethlehem Iron Company's works, under the eyes of the company's officials and the Russian inspector.

SALESMEN'S REPORT BOOK CO.,
Pottstown, Pa.

THE "TRACER" TELLS.

THE "TRACER" TELLS — Isn't it worth your while to learn what other Wholesale merchants know about Retailers who seek credit from you? The "Tracer" tells.

THE "TRACER" TELLS — Isn't it worth your while to learn from other Wholesale merchants what record your would-be customer has made with them? The "Tracer" tells.

THE "TRACER" TELLS — Isn't it worth your while to be able to ask several thousand merchants everywhere what they know about a man you want to know about? The "Tracer" tells.

THE "TRACER" TELLS — Isn't it worth while to learn that one of your customers, who is prompt in New York. Philadelphia, or St. Louis, is getting *very slow pay* in Chicago and Boston? The "Tracer" tells.

THE "TRACER" TELLS — Isn't it worth while to learn your customers' inside business history, not from outside guesses, but from inside records; *the actual experience of those who have dealt with them?* To learn those things that determine *character* and *business ability* as well as *financial strength?* The things that make you trust or distrust a man? The things that come up in actual business dealings, but which an outsider cannot know? The "Tracer" tells.

THE "TRACER," TELLS — Is he honest? Is he tricky? Is he careful, prudent, shrewd? Has he the qualities of success? Does he cancel orders unjustly? Does he make false claims for deductions? Is his record good or bad? Are his methods good or bad? The "Tracer" tells.

THE "TRACER" TELLS — and it is the *only* thing that tells. Every business man leaves a record, widely scattered in the ledgers and in the minds of merchants far apart That record, if gathered, is the best proof of what a man actually *is*, in his business relations. The "Tracer" gathers these scattered leaves and makes the record complete. The "Tracer" goes to thousands of Wholesale merchants everywhere. From them come a dozen detached bits of experience, concerning one man; together they show his whole business past, and his present condition. Has he over bought? The "Tracer" tells. Is he getting slow? The "Tracer" tells. Is it time for caution? The "Tracer" tells.

HE "TRACER" TELLS — this history to us in fragments. We tell it complete to all who supply the fragments. They supply a few facts; *in return they get a complete history.* In addition to our *unrivaled* "TRACER" report, this Agency gives all the benefits that any other Mercantile Agency can possibly furnish, including a Reference Book of Credits, semi-annually, January and July issues. For terms write: THE JOHN W. EALY COMPANY, New York, Boston, Philadelphia, Chicago, Pittsburgh, or Cincinnati.

Art of Coppersmithing.

A Practical Treatise on Working Sheet Copper in all Forms.

By JOHN FULLER, Sr.

327 Pages, 474 Illustrations, 7 x 10 inches, Cloth. Price, $3.00.

This work, prepared at great labor and expense, is reproduced from *The Metal Worker*, and forms an exhaustive treatise on the Coppersmiths' Art, being the only volume on that subject that has been published. It is beautifully illustrated with 474 pen and ink drawings, and is bound and printed in the best manner.

CONTENTS:

Historical Sketch of Copper; Braziers' Art, or Light Coppersmithing; First Year's Experience; Repairing and Tinning; The Boy's Second Year; Making Washing Coppers; Making Small Brewing Coppers; Table of Dimensions and Capacity; Making Hand Bowls; Making Frying Pans; Making Closet Pans; Making Water Balls; Mounting for Copper Goods; Glue Pots and Tea-Kettles; Oval Tea-Kettles; Beer Mullers; Funnels; Coffee Pots; Sauce pans and Pudding Pots; Stewpans; Stock Pots; Fish Kettles; Brazing Pans; Tea Boilers; Warming Pans; Preserving Pans; Dripping Pans; Coal Scoops and Coal Hods; Making Coal Scoops; Planishing and Smoothing; Cranes or Syphons; Pumps; Appliances of Railway and Marine Coppersmiths; Making Copper Pipe; Piecing and Joining Pipes; The Fire Pots; Fire Pot Set fo Brazing Joint; Soft Soldering Large Joints; Taking Templates; Filling and Bending; Making Bends; Template Boards; Patching Pipes; Outlets; Expansion Joints; Tee Pieces; Three-way Pieces; Cross or Four-way Pieces; Saddle Fire; Marine Work; View of Maudsley, Sons & Field's Shop; Making Large Bends; Making Double Bends; Brazing on Flanges; Short Bends; Air Pipes for Ships; Making Hollow Spheres; Brazing Sheet Brass; Locomotive Brass Work; Brass Dome Covers; Heavy Pipes for Breweries; Brewing Coppers or Kettles; Dome Coppers; Dome and Pan Coppers; Tallow Coppers; Dyers' Coppers; Sugar Tieches; Stills.

How Many Beans in a Bushel?

Several customers were chatting in a Lafayette avenue grocery store one evening recently, when the grocer pointed to a half barrel of small beans and asked how many of them it required to make a bushel, says the New York *Herald*.

Various estimations were offered. One man recklessly put the number down at 50,000, which occasioned a laugh from all the others, who had guessed a much less quantity, ranging all the way from 5000 to 20,000.

"Well, gentlemen," remarked the grocer, "you are all wrong. There are approximately 119,000 beans in a bushel."

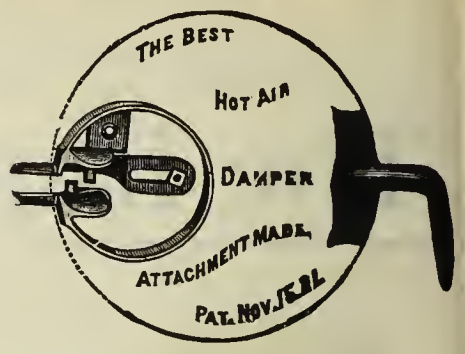
No one was inclined to believe him. He showed them that it took 60 beans, selected at random, to weigh ½ ounce. The rest of the calculation was simple.

"Now," then said one of the party, "since we are engaged in guessing contests, how many dollar bills would it take to weigh as much as a silver dollar?"

One said 100 and another said 75, while the grocer, who knew all about the beans, put the figures at 300.

"All wrong," remarked the man. "It takes just 22." This was proven to be the case by experiment.

— MAMMA: "You must be very careful. The doctor says your system is all upset."



Little Dot: "I guess it is. My foot's as'eep. Foteses must be awfully upset w'en they goes to s'eep at the wrong end." — *Good News.*

— YOUNG TUTTER: "What we want in our society, Miss Maude, are brains, brains."

Miss Summit: "But how are you going to supply them?" — *Vogue.*

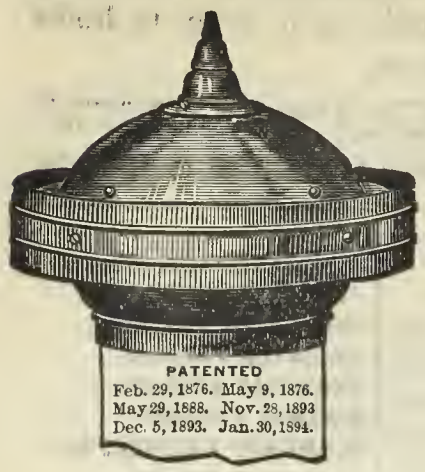
ROYAL
WASH BOILER HANDLE.



PATENTED.

We call the trade's special attention to the Roya Handle, being the cheapest and the most durable handle in the market, fully protected by a number of letters patent, and all manufacturers using the handle report that their trade on wash boilers has largely increased. Over 100,000 handles sold in our local trade last year.

The advantages gained by using the Royal Handle can be readily seen, as it far excels the old fashioned tin or iron drop handles in beauty and strength, fits the hand perfectly and is always cold and adds greatly to the general appearance of boiler. Manufactured only by

SECOND EDITION.
PRACTICAL HINTS
—ON—
JOINT WIPING,
FOR BEGINNERS IN PLUMBING,
WITH THIRTY-FIVE ILLUSTRATIONS.
43 PAGES. PAPER, 25c.

This book contains a reprint from *The Metal Worker* of two articles on the method of Joint Wiping, an operation calling for a very large degree of manual skill.

The first account is written by a practical plumber, and is illustrated from photographs faithfully representing the hands and tools when wiping joints in various positions.

The second account, by an expert joint wiper, is also illustrated from photographs and will prove of great assistance to learners.

Ample instructions are given on preparing the pipes previous to wiping the joints, with full descriptions of all tools and appliances used.

The pamphlet, in short, gives all the assistance that description of the work can furnish and is the most practical and complete account of joint wiping that has been published.

Sent, post-paid, on receipt of price, 25c.

DAVID WILLIAMS,
PUBLISHER,
96-102 Reade St., New York.

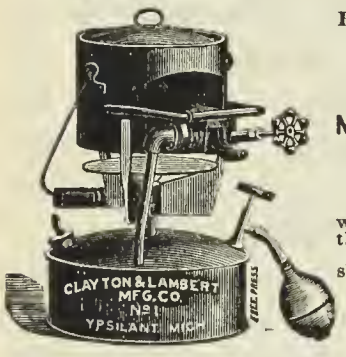
Columbus

WROUGHT STEEL SINKS

ARE DRAWN FROM A SINGLE SHEET OF STEEL, AND ARE SUPERIOR TO CAST IRON SINKS IN EVERY PARTICULAR; BEING LIGHTER, STRONGER AND MORE DURABLE. WILL NOT BREAK FROM HEAT, COLD OR ANY CAUSE WHATEVER. BEING LESS POROUS THAN CAST SINKS, ARE COMPARATIVELY ODORLESS, AND THEIR GREAT ELASTICITY AVOIDS THE BREAKAGE OF DISHES.

THE BOTTOM IS FORMED TAPERING TO THE CENTER AND THE OUTLET, SO THAT THE DRAINAGE IS PERFECT, AND ENABLING THE ATTACHMENT OF STRAINER AND PIPE MORE SATISFACTORILY THAN IS POSSIBLE WITH ANY OTHER MAKES.

We Are The Originators



OF THE WROUGHT STEEL SINK, AND ARE IN POSITION TO SUPPLY THEM IN ANY STYLE FINISH DESIRED, AND IN MANY DIFFERENT SHAPES, AT PRICES THAT WILL BE NAMED.

AUTOMATIC FLUSHING VALVE FOR URINALS.

OPERATED BY TREADLE.

This is the neatest and most economical method yet designed for the purpose. Urinals flushed by this method will be cleaner and freer from stoppage than those flushed by any other system, and less water consumed in doing it, for the simple reason that the flush only occurs when the urinal is in use.

The operating valve has a flange on its upper end for bolting to the floor, and which is let into the floor slab, thus presenting a smooth flush surface which can be easily washed. The top of the valve is arranged with a cap; by unscrewing this all the working parts, including the seat, can be taken out for repairs when necessary, thus leaving nothing but the main supply "A," the supply to Urinal "B," and the Valve Chamber "C," either in or under the floor, and these parts may be considered almost imperishable.

The treadle "D" is Cast Iron, galvanized (also furnished in brass), one end of which is fastened to the floor slab by brass bearings which permit of its being thrown back for the purpose of cleaning under it. The other end rests on the valve spindle.

When a person stands on the treadle (and he cannot get at the urinal unless he does), the flush begins and continues until he leaves it, when the valve closes automatically. By this method the flushing water is delivered at the time it is most required, and is, therefore, unlike the periodical flushing tank, which is delivering water regardless of whether the urinal is in use or not, and so wasting water.

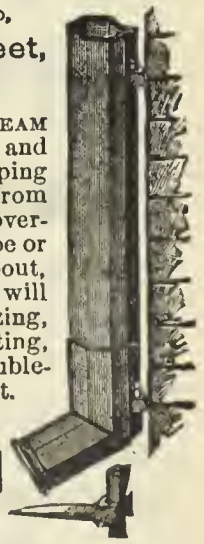
PATENT

EXPANDING WATER CONDUCTOR.



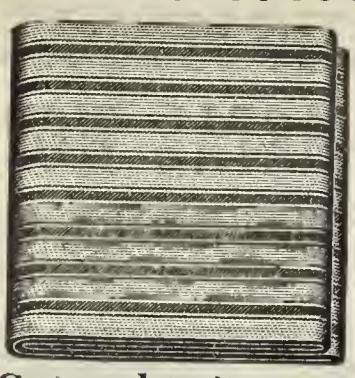
MANUFACTURED BY THE

S. S. S. Conductor Co.

LIMITED,

163 Lacock Street,

ALLEGHENY, PA.

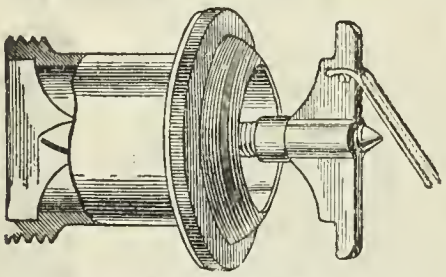


THE STANDING SEAM allows of an easy and secure fastening, keeping the pipe far enough from the wall to make any overflow from the eave pipe or head, run down the spout, and not the wall; and will open, in case of freezing, so as to prevent bursting, and still remain double-locked and water-tight.

Made in 6-foot lengths of a single sheet of SOFT STEEL.

GALVANIZED, KALAMEINED or LEADED.

The Irwin & Reber Expanding Water Conductor Pipe has been extensively used through the United States and Canada for the past ten years and has proved itself to be the best in the market. Send for Price-List.



"Columbia" Wiping Cloths FREE!

Not free exactly from a financial standpoint (altho' very near it), but free from all defects due to a **Poor Quality of Ticking, Carelessness in Making and a Bungling Manner of Fastening the Ends.** A cloth free from the above defects is well worth the price we ask, 12 cents each, or six for 70 cents. Remember we make any kind—send us the size you want, giving the wiping edge first.

IMPROVED SANITARY WATER CLOSETS.
Wrought Iron Pipe of all sizes cut to order.

Maule's "Skeleton" Pipe Die

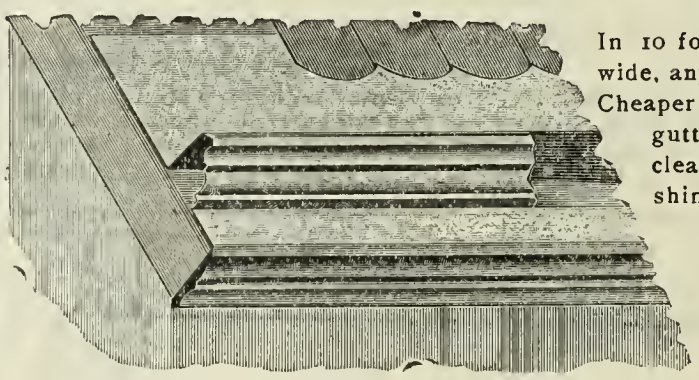
Two "Points" about it—only 2 (There are plenty more, but we only mention these two here.)

1

The First Cost to you of MAULE'S "SKELETON" PIPE DIE is less than that of any other Pipe-Threading Die—and

2

Before it becomes dull from use it will cut as many perfect threads as the best solid die extant, and when it is dull, you don't throw it away and buy a new one—Oh, no! You simply sharpen the cutters on a common grindstone, and so make it practically as good as it was at first, and this sharpening process may be repeated a number of times.



A sample One-inch "Skeleton" Pipe Die, either 2⅜ or 2½ x ¾ thick, by mail, postage prepaid, will cost you 62 cents, and will be sent upon receipt of a Postal note for that amount.

DO NOT SEND US ANY POSTAGE STAMPS.

You may return such sample to us, at our expense, if, after seeing it, you do not consider it worth the price. Don't the above sound as if it might save you some money—if TRUE?

Hicks' Guide FOR Builders,

Comprising an easy, practical system of Estimating Materials and Labor for Carpenters, Contractors and Builders.

A comprehensive guide to those engaged in the various branches of the building trades.

By I. P. HICKS.

160 Pages. - 114 Illustrations.

Bound in Cloth, Price, - $1.00

This book presents to the trade, first, an easy, practical system of estimating materials, in concise form for reference. In the next place is given the average day's work of all kinds, and the average rates on which to figure in almost every detail of building construction.

Material and Labor, including Lumber, Carpentry Work Masonry, Plastering, Hardware, Painting, etc., are among the principal divisions. These in turn are illustrated and ably treated under numerous sub-divisions, showing step by step the entire work of estimating, contracting and building, together with the best and most practical methods of doing the work.

This is followed by a section given to the Geometrical Measurements of Roof Surfaces, with numerous illustrations and examples. It embraces a new and simple system of framing curved roofs, also the simplest methods of roof framing of every description, with practical examples thoroughly illustrating nearly every conceivable form of roof and showing many points never before presented.

The volume also contains a chapter on Mitering Planceers, Moldings, etc., illustrating and describing how to make, in an easy, practical manner, many joints which are the source of no little trouble and annoyance on the part of the workman.

— THE VERY LAST.—They sat in the twilight and talked of the past.

"Hiram," she was saying, "just 20 years ago to-night I first became aware that you had kindled a flame in my heart."

"Yes, Anastasia."

"That," she mused reflectively, "was about the last kindling I know of your doing, Hiram."

He did not speak for a long time. When he did, it was concerning something else. —*Detroit Journal.*

— ROBBY: "Mamma, if Santa Claus is such a good man, why does he give so many more presents to rich children than he does to the poor ones?"

MOTHER: "Because it takes so much more to please a rich child than it does a poor one, my son."—*Judge.*

— "NEVER," she said, haughtily, "never darken my doors again."

He stood before her humbly, and would have spoken, but she silenced him with a wave of her bejeweled hand, and went on:

"I told you in the first place that I wanted them doors painted a robin's-egg blue, and here you've went and grained them. I know what I want, and I'm goin' to have it."

Wearily he got out his putty knife and sandpaper and began to rectify his error. —*Indianapolis Journal.*

Uncle Sam's Flags.

Before a man of-war is completely equipped she must be supplied with a varied assortment of the flags of all nations. The flag lockers of a cruiser like the "New York" will contain more than two hundred different ensigns.

All the flags for our navy are made in the equipment building at the Brooklyn Navy Yard. The floor of the flagroom is covered with lines representing the exact measurements of the various ensigns, and it is no easy matter to turn out a flag which will be exactly according to pattern, both as to design and measurement.

There are eight colors used in flags—red, white, blue, orange, yellow, green, brown, black and canary yellow.

The canary yellow is used instead of white in flags used for signaling. This is because it is found that, when signaling at a distance, a white flag or a device on a white ground blends with the horizon and becomes almost invisible.

The largest American flag made is called No. 1. It measures 34.86 feet in length and 13.12 feet in breadth, and is very rarely used.

The size called No. 2, which is considerably smaller, is the one generally used by warships.

Cruisers carry the stars and stripes in seven different sizes, but only the "Minneapolis" and "Detroit" fly the gigantic No. 1 size.

The most difficult flag to make is that of San Salvador. This flag requires all the colors, and Costa Rico runs it close, requiring all but brown.

Our own flag is by no means an easy one to make. The 44 stars in their blue fields have to be accurately arranged and stripes mathematically exact, according to the official pattern.

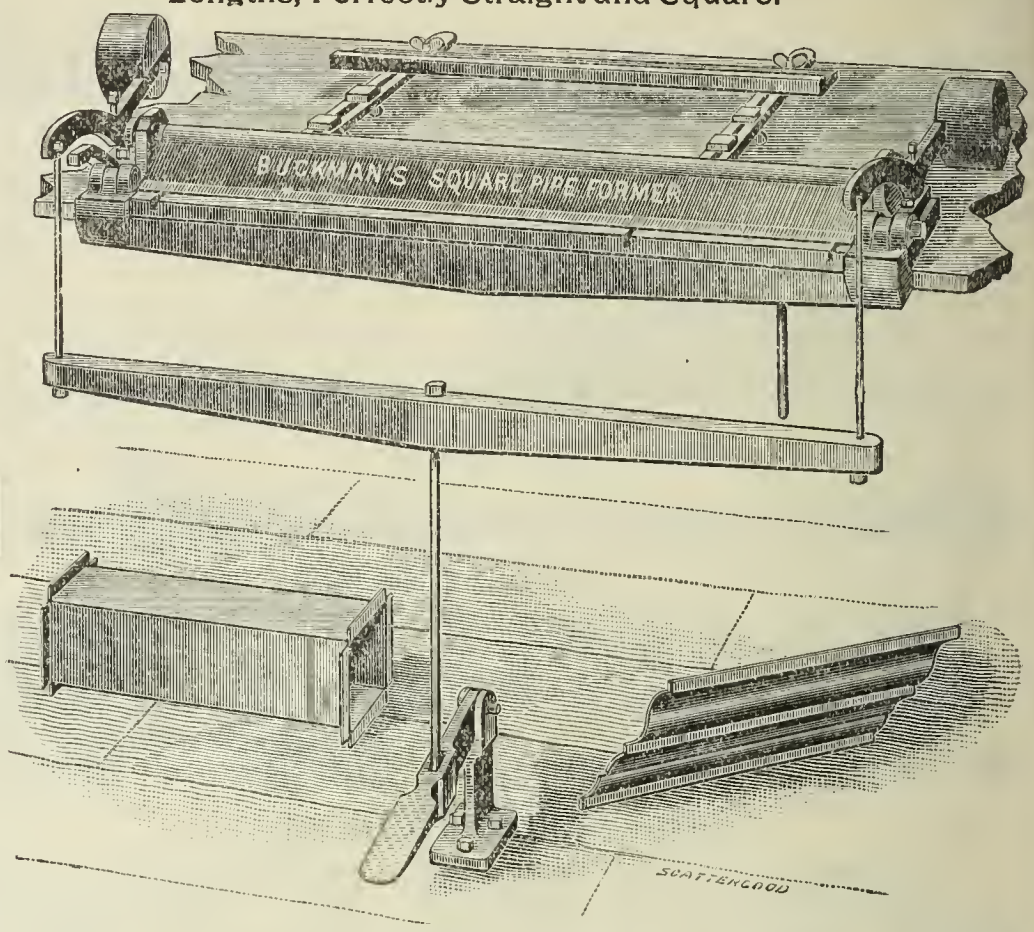
The stars are made of muslin, folded 25 times and punched out by a steel punch, which cuts a dozen or more stars at each operation.

There are used in the navy yards 50,000 yards of bunting annually, which is all made in the United States. Before being made up into flags the bunting is put to a very severe test. From each lot a sample is taken and steeped in fresh water for 24 hours. After that it is thoroughly scrubbed with strong soap and then rinsed and dried. It is then exposed to the direct sunlight for 18 hours, and if it shows no fading in color it is accepted.

The industry gives employment to a great many men and women.—*West Jersey Press.*

A Story of Lincoln.

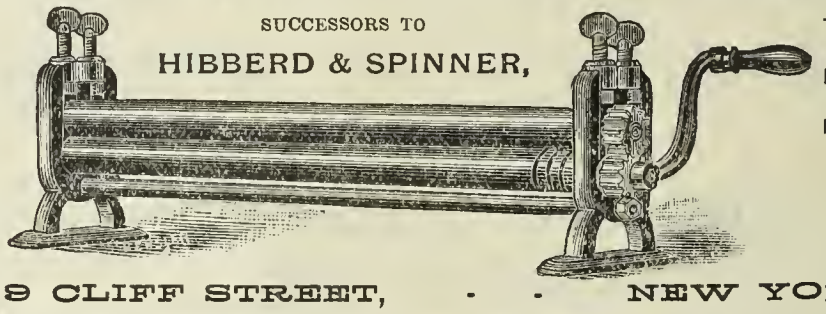
The following story is told in a recent issue of the *Century:* The First Corps, commanded by General Reynolds, was reviewed by the President on a beautiful plain at the north of the Potomac Creek, about eight miles from Hooker's headquarters. We rode hither in an ambulance over a rough corduroy road, and, as we passed over some of the more difficult portions of the jolting way, the ambulance driver, who sat well in front, occasionally let fly a volley of suppressed oaths at his wild team of six mules. Finally Mr. Lincoln, leaning forward, touched the man on the shoulder, and said :



"Excuse me, my friend, are you an Episcopalian ?"

The man, greatly startled, looked round and replied :

"No, Mr. President ; I am a Methodist."



"Well," said Lincoln, "I thought you must be an Episcopalian, because you swear just like Governor Seward, who is a churchwarden." The driver swore no more.

MY FAVORITE PAPER.

There's a little country paper that I love
to sit and read,
A paper poorly printed and behind the
times indeed;
With its pages small and narrow and ink
inclined to spread,
And here and there a letter gravely stand-
ing on its head.

Or caps, a bit erratic, boldly popping into
view
In unexpected places, and knocking things
askew.
A real old-fashioned paper, from my own
native little town,
Each week I hail its coming, and I never
put it down—

Till I've read its every column, all the
local news, you know,
About the dear old folks I lived with long
ago.
I note whose barn is painted, whose cattle
took the prize
And how Uriah Potts has raised a squash
of wondrous size.

How Farmer Martin's daughter takes the
school another year—
At this I pause and smile a bit and feel a
trifle queer,
Remembering how, in bygone days, when
life seemed made for mirth,
I thought this schoolma'am's mother was
the sweetest girl on earth.

And now and then, perchance, I read
that one I knew is dead,
Or find again some boyhood chum the
second time has wed;
And so it goes, and none can know what
memories sad and sweet
Come back to me whene'er I read this
homely little sheet.

— IRASCIBLE OLD GENT: "Waiter, this plate is quite cold!"

Waiter: "Yes, sir; but the chop is ot, sir; which I think you'll find it'll warm up the plate nicely, sir."—*London Tit-Bits.*

THE METAL WORKER

PATTERN BOOK.

SEVENTH EDITION.

This is a handsome volume of 242 pages, printed on heavy paper, and substantially bound in cloth. It is illustrated by upward of 520 line engravings.

The work is comprised in five general divisions or chapters, bearing the following titles: (1) Definitions and Technicalities; (2) Drawing Tools and Materials; (3) Geometrical Problems; (4) The Art and Science of Pattern Cutting, and (5) Pattern Problems. These titles sufficiently indicate the subject matter of the several parts.

The List of Problems

demonstrated is very extensive, and embraces almost everything of common occurence in the sheet-metal trades, with enough of the exceptional to show methods adapted to special requirements. This chapter, in short, is a ready reference book for all who have pattern cutting to do. Each demonstration is complete in itself. A carefully prepared index facilitates reference. The work has been prepared for sheet-metal workers in general, and not for any one class in particular. The tinner will find in it what he requires, without the necessity of studying the cornice problems. The cornice maker will find in it everything from a simple miter to the most complex problems, so arranged as to meet his requirements, without the necessity of going through portions in which he is not interested. The general student will find the entire subject presented in such a manner as will facilitate systematic study. The rapidity with which each edition has been exhausted, and the universally favorable comments it has called forth, prove that it fully meets the want it was intended to supply

HAND POWER LEVER SHEAR.

Will shear as heavy as No. 10 Gauge Steel or Iron. Very powerful, strong and low in price.

Geo. C. Keene & Co.

Mfrs. The Keene Brake.

CINCINNATI, OHIO.

PRESSES, DIES AND TOOLS

For Can and Tinware Manufacturers.

Dies for Cutting, Drawing & Stamping Tinware

Estimates given at sight of samples of drawing work.

Send Sample for Prices before ordering elsewhere.

DOVER MACHINE WKS, Dover, Del.

Combination Shear.

Cuts Wide Sheets 3-16 inch thick or No. 10 Gauge. Two Gauges for Slitting and Squaring.

Send for Circular and Prices to

R. M. CLOUGH, Tolland, Conn.

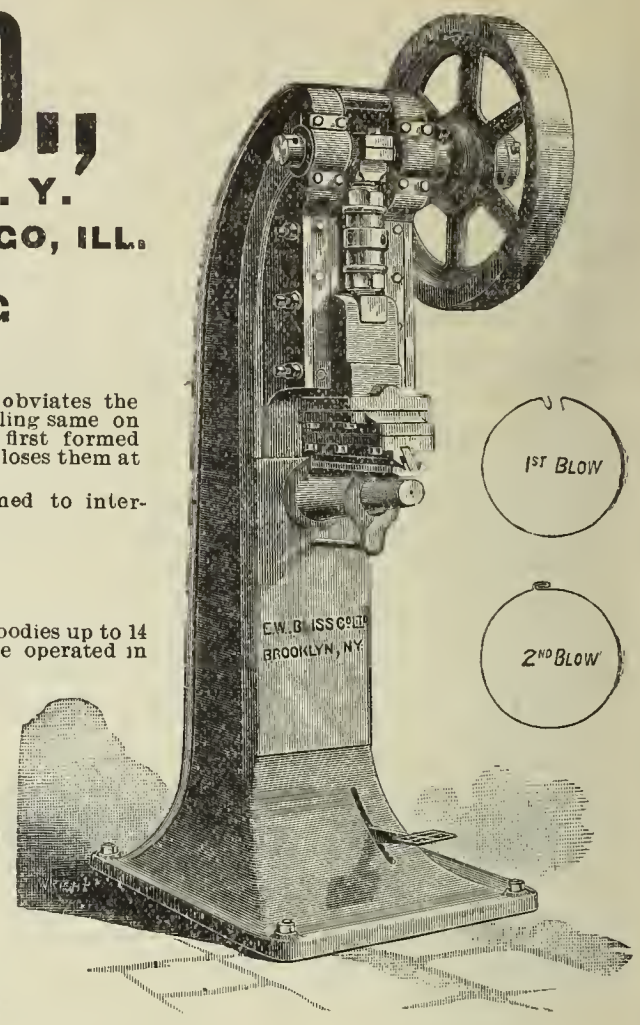
DUPLEX FOLDING AND SEAMING MACHINE.

THIS machine is designed to facilitate the manufacture of lock-seamed tinware. It obviates the necessity of using a bar-folder for forming the hooks on the body blank before rolling same on the forming machine. Its operation is exceedingly simple and reliable. The blank is first formed in the rolls, then placed in the machine, which forms the two hooks at one stroke and closes them at a second operation. The advantages obtained are:



First—That the blank is rolled in the flat, not having any hooks previously formed to interfere with the operation.

Second—That both edges are hooked at one blow

Third—That the hook forming and closing are done in one handling.

Fourth—That the seam is more uniform than if started in the bar-folder.

The horn can be arranged to throw the seam inside or outside. All sizes of bodies up to 14 inches long can be done on the one horn. These horns and forces are not adapted to be operated in presses having more than ½ inch throw.

HAMILTON'S

BEST RE-DIPPED AMERICAN ROOFING TIN

—o— IS THE VERY BEST TIN MADE.—o—

The very best American Soft Steel thoroughly cleaned, then Dipped and Re-Dipped by hand through Pure Palm Oil until it has the thickest even smooth coat of any tin ever made in Europe or America.

MORE DURABLE TIN CANNOT BE MADE.

It is the Best Roofing Tin possible to make. This is what Hamilton's Tin has been found to be by all users. Acknowledged the best by others who claim their plates to be "as good as Hamilton's."

Plates are stamped, re-squared and guaranteed by the manufacturer,

JOHN HAMILTON,

62-64 Third Avenue, **PITTSBURGH, PA.**

McCLURE'S REDIPPED

ROOFING TIN.

AMERICAN MADE.

The finest and heaviest coated Roofing Tin made; guaranteed to contain **35 lbs. Coating** per 112 sheets.

A very important point in a Roofing Plate is to secure a uniform coating; **McClure's Redipped** is made by a process by which the coating is distributed **evenly over the sheet,** leaving no thick edges which are found on other "OLD STYLE" or "REDIPPED" plates, and which interfere to a great extent in working the sheets.

McClure's Redipped has been thoroughly tested and found to be of **superior quality** to any other "OLD STYLE" or "REDIPPED" plate made. A sample box will substantiate our claim.

IMPORTANT ANNOUNCEMENT.

TO OUR PATRONS AND THE TRADE GENERALLY:

Our new Catalogue for 1895 will be ready for distribution within a few weeks. We take this means of announcing in advance of its publication that we have very carefully studied the requirements of the trade in every particular, and that our lines will be complete. We will place on the market specialties in entirely new goods that will commend themselves both by reason of popular prices and their many attractive and desirable features. In addition to our very popular Oilgas Cook Stoves, containing our improved 1895 Burners that are giving such perfect satisfaction, we have something entirely new in the line of special Lamp Stoves at special prices; also Sheet Steel Circular Burner Oil Cook Stoves. Write for further information and prices.

We are pleased with the prospects of the coming Gasoline season.

Since the Dealers have seen our Stoves and convinced themselves that we manufacture and carry

The Most Complete Line, the Finest Appearing and Best Working Gasoline Stoves,

Inquiries and orders are pouring in on us. This is very gratifying and at the same time nothing unusual, as the intelligent buyer will at all times avail himself of an opportunity to get the best at the same price.

And we certainly insist that our Gasoline Stove is the best in the Market.

Our Illustrated Catalogue is ready and will be sent on application.

Send for Discount and Secure Territory.

Western Stove & Mfg. Co.

MILWAUKEE, WIS.

CHICAGO OFFICE: Room 73, 88 & 90 Washington Street, T. J. DUFFY, Jr., Sales Agent.

DEALERS!

All Weak Points About Vapor Stoves

are not called to your attention by unscrupulous manufacturers or their salesmen. They often palm off imperfect and faulty stoves as perfect, and jolly you into the belief that you have struck a bargain.

But when summer comes and truth comes to light, as it invariably does in the vapor stove business, vexation and disappointment come with it. Vexation, because you have been duped, disappointment, on account of the loss of a season's profit.

Better handle a *good line* at a fair profit than a *poor* line at a *bargain* profit. There is no such thing as a "bargain," especially in the vapor stove business. *Proof*—Review the past ???

Better buy from a responsible manufacturer or his legitimate jobber, especially of one whose integrity is unquestioned, and one whose knowledge of the vapor stove business secures you an honest deal and prevents the imposition of fakes or shoddy goods. *There are a few of us left.*

Better buy a good line to be successful. A *bad* stove is a very poor purchase at *any* price.

Better look for Protection.

Protection in order to be of service to you must begin at home. See that this point is not overlooked when casting about for a line for 1895.

Better think this over.

The old adage reads, "Make Haste *Slowly*." This is a weighty proverb. The more so when you consider that the best versed manufacturers in the vapor stove industry are not offering any new inventions or innovations for the coming season.

Yours respectfully,

THE SCHNEIDER & TRENKAMP CO.,

479-501 Case Ave., Cleveland, O. 67-69 Lake St., Chicago, Ill.

Facts of Interest to the Public.

Our "PROCESS" for 1895, we can say unqualifiedly, is the

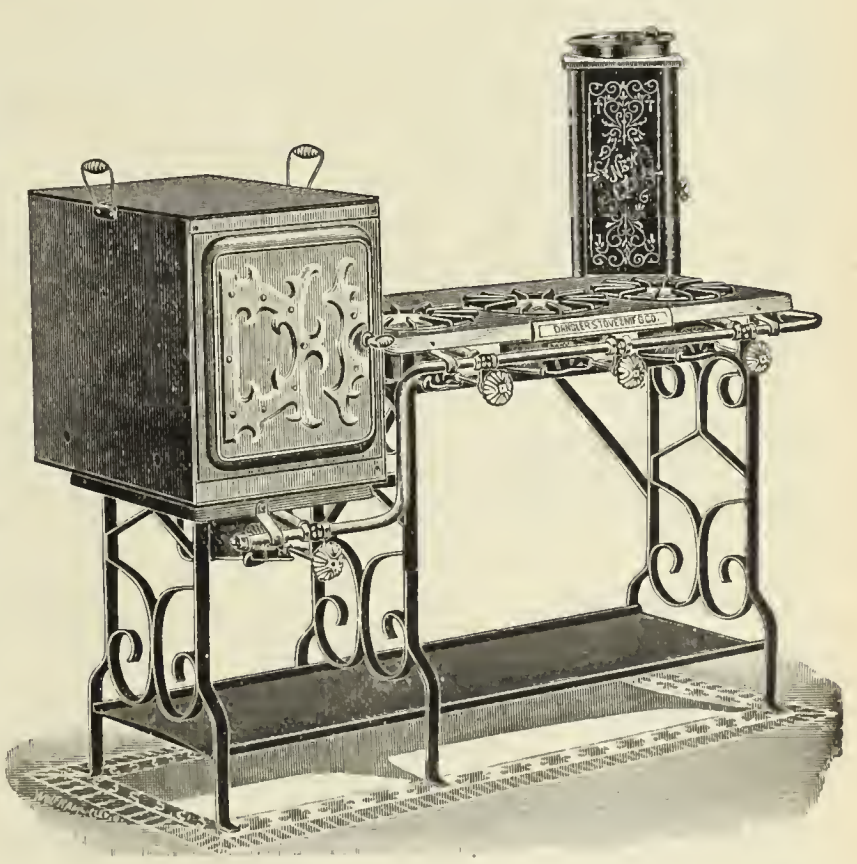
MOST PERFECT WORKING PROCESS STOVE EVER PLACED ON THE MARKET, and HAS NO EQUAL.

In calling attention to our

NEW GEM STOVE,

We offer the trade a STOVE FOR THE PEOPLE and FOR THE TIMES.

THE GEM STOVE is CONVENIENT



in SIZE, with the same sized flame as the PROCESS doing the same amount of work with **less fuel,** and at an original cost of only about ONE-HALF that of the regular high Stoves. This Stove is ABSOLUTELY our own, and CAN BE MADE ONLY BY US, and as pioneers in this business, the public naturally look to us for progress, while some of our competitors, who can only make the old line, call such improvements, "an innovation." Our GEM and PROCESS, together with our DELIGHT, celebrated JUNIORS, Individual and Single Generator Burner Stoves, &c., will give our trade a decided advantage over their competitors,

The Weathered Hot Water Heater.

MANUFACTURED BY

THOS. W. WEATHERED'S SONS,

139, 141 and 143 CENTRE STREET, - - NEW YORK.

ESTABLISHED 1859. INCORPORATED 1893.

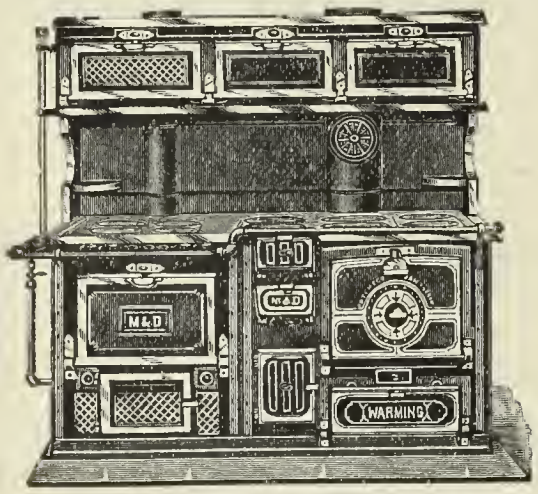
For Heating Dwellings, Greenhouses, Churches, Public Buildings, &c.,

By Hot Water Circulation Only.

OVER 6,000 IN USE.

Guaranteed to be more economical, quicker in circulation and more durable than any heater in the market. Hundreds are in use and doing good service that were put in 25 years ago. Send for our illustrated catalogue, **"Health and Comfort in the Home Circle."**

Hear 'em Holler!
Oh, my! ain't it Funny?
The "combine" at last see their Waterloo.
The beginning of the end of the Vapor Stove Association.



No wonder they holler, for they know not "where they are at." The L. & H. Process did it.

Dear people, don't be alarmed when you hear their noise. It is the old story of great cry and little wool. Have you read their bluff? Of course you have. Ain't it sublime? Oh, my! what a lot of advertising for us. A regular snap.

Just as soon as the dealer reads their warning he gets on his fighting clothes and at once looks into the merits of the L. & H. Process. We are deluged with orders, and are all smiles, for the trade stands by us and will not be intimidated by the "combine." We know who our friends are, and therefore congratulate ourselves. When the dealers see our L. & H. Process stove they will have no other. The "combine" know this; hence all the commotion, and all they can do is to rush into print in their efforts to stem the return of their boomerang, but it does not work and in their agony they ask themselves "how can it was?"

Buy nothing but the L. & H. Process. **We are with you. Your interests** are ours. **We are here to stay.** The **L. & H.** mark shines **brighter than ever,** for **"It's a good thing, push it along."** Hurry up and write for catalogue so you will not be left.

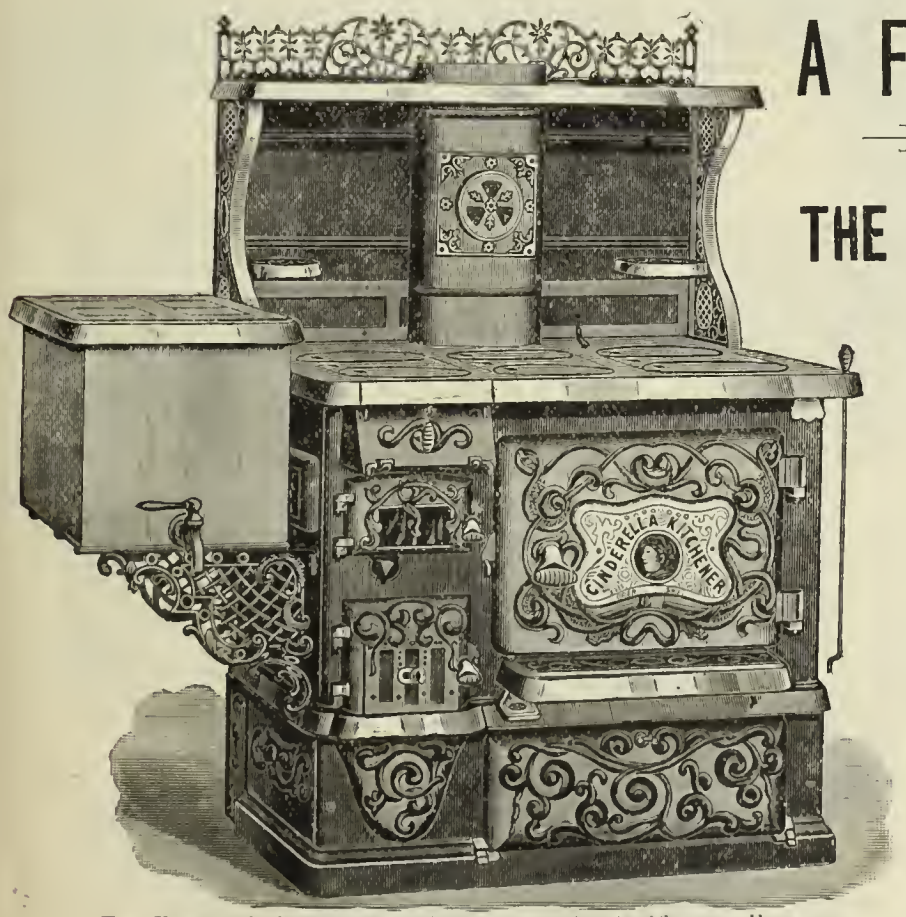
Announcement of



An Important Meeting to take place at Offices of

The Ferrosteel Company,

Wade Building, Cleveland, Ohio,

Monday, February 4th, 1895—And following days.

This meeting is one of orders and inquiries for Ferrosteel Ranges that will be received. Also applications for agencies. Orders from traveling representatives, too. Will your order, inquiry or agency application be received with others? It's the style now to handle Ranges made of Ferrosteel. New sizes for 1895 Spring trade.

The Reservoir is Planished Copper, and holds fifteen gallons.

A FEW WORDS
TO THE PROGRESSIVE DEALER.

THE CINDERELLA KITCHENERS

Are an entirely new series of

ALL CAST IRON RANGES,

Adapted for burning

HARD OR SOFT COAL OR WOOD.

They have embodied in their construction many new and desirable features that are thoroughly practical and will meet the approval of the "up to date" dealers. The Cinderella Kitcheners are also made with feet and skirting in lieu of the Low Closet. A full complement of High Shelves and High Closets accompany the same. Every appointment is the latest, and for excellence of construction and beauty of design they cannot be excelled.

Made in the following sizes:

No. 716,	Oven 16 x 16,	10½ inches high.
718,	18 x 18,	11½ "
818,	18 x 18,	11½ "
719,	18 x 20,	12½ "
819,	18 x 20,	12½ "
821,	20 x 22,	13½ "
921,	20 x 22,	13½ "

IF YOU ARE INTERESTED WRITE FOR PRICES.

We are makers of a complete line of Stoves and Ranges under the trade-mark of

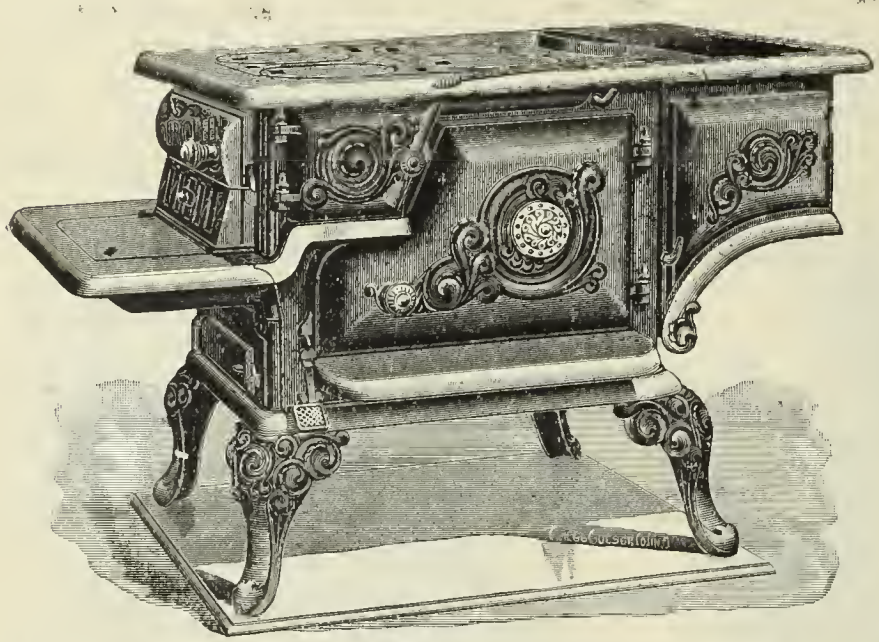
"CINDERELLA."

We Would be pleased to send our catalogue upon application.

DeHAVEN & CO., Limited - - Pittsburgh, Pa.

Taplin, Rice & Company,

—Manufacturers.—



DICTATED BY P. **Akron, Ohio,** January 29, 1895.

BY THIS we beg to call the attention of the trade to the fact that during the current year we will be on the market with several new patterns of Steel Ranges and Heating Stoves, of superior construction, ornamentation and attractive form, the patterns of which are well under way and will soon be ready for the sand. The Climax Steel Range, which will be made in all the various conventional forms and styles, will be both as to construction and appearance second to none on the market. We will also have ready for the trade in due time a "Climax Air Blast" and "Climax Air Tight" heating stove] in different sizes, the constructive features of which will be a radical departure from any pattern of stove ever offered, and we feel well assured they will wherever introduced take a leading position in the line of special heaters. Cuts and prices of these Ranges and Stoves will be mailed on application at an early date, and we are confident you will feel justified in deferring your order for supplies until samples or cuts of stoves named may reach you.

With grateful appreciation of former courteous favors shown us by the trade, we remain,

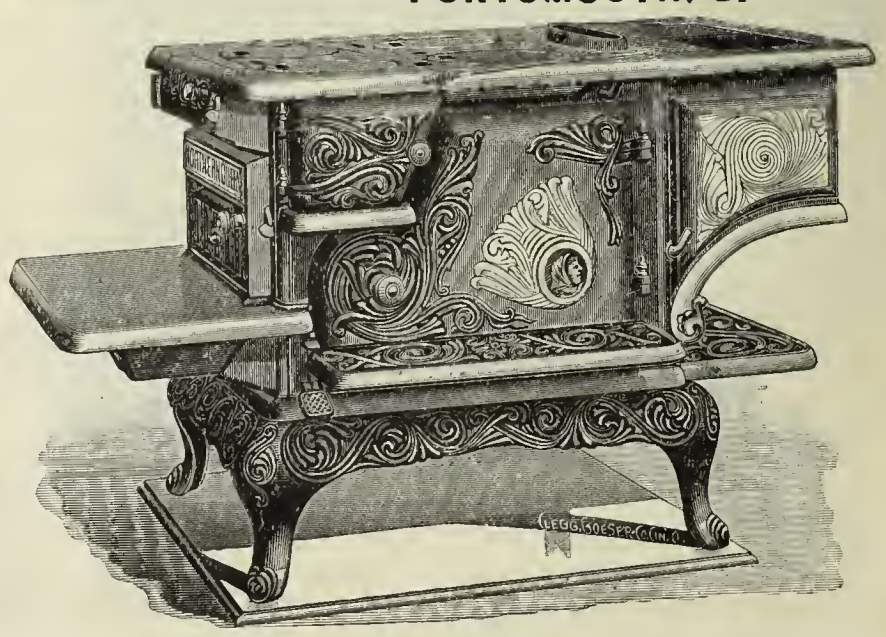
Very respectfully,

TAPLIN, RICE & CO.

Our Queen.

For wood, with all latest improvements. A new stove throughout at a very low price, yet of the finest grade. Made in all the usual sizes and styles. No dealer's stock complete without a line of them. Try a sample and get on to the good points of them.

The Portsmouth Stove & Range Co.,



PORTSMOUTH, O.

Northern Queen.

A new Coal Cook than which none superior is made anywhere. In fact many not near as good Look at the design, the mounting is equally as high grade, while the castings are smooth and heavy. Write for Catalogue.

THE DAWN OF PROSPERITY.

WILL. H. BRADLEY, DES.

It has been said that in America TWO CLASSES of Stoves and Ranges are sold, viz.: . . . . . "GARLANDS" and OTHERS.

At the very HEAD and FRONT of the "Others" stands our new line of . . . "MICHIGAN" Stoves and Ranges,

Which are unquestionably the latest, handsomest and most artistically-designed Stoves and Ranges to be found upon the market at anyth'ng like the price at which they are sold.

They are made under our own supervision; by same workmen and out of the same material from which "Garlands" are made, and this fact of itself should be sufficient to cause them to be preferred by discriminating merchants and consumers, as against all other brands, excepting the invincible line of "Garlands."

SECOND EDITION.

KITCHEN BOILER CONNECTIONS.

A SELECTION OF

Practical Letters and Articles Relating to Water Backs and Range Boilers.

Compiled from THE METAL WORKER.

71 Illustrations, 8vo, 140 Pages, Cloth,
Price, $1.00

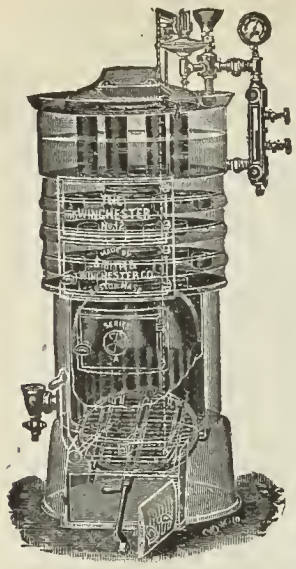
The book is well got up and the information well given Those interested in works of this character will do well in buying it.—*The Plumber and Decorator.*

The Metal Worker produces in this volume a number of queries, with answers thereto, which have appeared in that paper. It will be seen that *any plumber who is troubled to make boilers work satisfactorily will here find his troubles alleviated. It contains numerous illustrations and throughout is highly practical from the standpoint of the plumber.* It contains a table of contents and an index.—*Scientific American.*

The publisher of this work is well known for his former successful efforts in the publication of useful and thoroughly practical books for metal workers and steam fitters The book before us is a model of its kind in judicious compilation, practical instruction, neat illustrations and general typographical appearance.—*The Master Steam Fitter.*

Can be considered an authority on the subject to which it relates.—*American Engineering.*

The book is a practical helper to every member of the plumbing trade, who, being alive to his own interests, should embrace this opportunity to obtain the valuable instruction in which the work abounds.—*New England Stove, Hardware and House Furnisher.*



A well bound, well printed, well illustrated and well edited book. . . The special field of this work is very thoroughly covered. . . Abounding in rare technical information of a practical character. *American Artisan.*

Nearly every problem is illustrated fully and this interesting question of water back connections will be found to be quite fully treated in the volume.—*Domestic Engineering.*

Both interesting and instructive to our trade. It shows how mistakes are apt to arise and how they may be overcome —*Plumbers' Trade Journal.*

Fireproof Celluloid.

The dangers attending the manufacture of ordinary commercial celluloid are well known. We understand, says *Industries and Iron*, that a member of the firm of A. & F. Pears, together with an associate inventor, have been successful in manufacturing a perfectly fireproof celluloid from spent fibers from paper mills, which they are proposing to manufacture on a large scale. The experimental works at Exeter, England, contain the necessary motive power, with edge runners, otherwise "Kollergangs," centrifugal pump, glazing rolls, guillotine, hydraulic press, laboratory, drying room, &c. The pulp, consisting of fibers collected from washing water of the paper mill, is placed in a dry state under the edge runners, and after treatment for some time is removed into a vat and submitted to the action of certain chemicals, which reduce it to a glutinous state. It is then sent through the centrifugal pump, which gives it an even substance, and any shade of color is then imparted to it at the same time by aniline dyes. It is then strained through flannel into square boxes, and after a time assumes an almost solid consistency. The celluloid can then be cut into slices, or molded when the composition is in a liquid state. It is proposed to make printing surfaces for illustrations, for stereotyping, together with its utilization for the manifold varieties of purposes to which the ordinary celluloid of commerce is now applied. The perfect safety of the new substance is shown by the workmen being allowed to smoke on the premises during the course of manufacture.

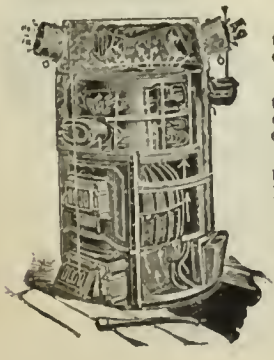
CORY'S



ALL CAST IRON
GAS-TIGHT FURNACES.

The purchaser will never ask if this is the *best* quality made, as all dealers understand the "Cory Furnace" to be only of *cast iron*, without bolted joints; gas-tight and durable. Quality exactly the same in twenty sizes from $35 to $125.

UZAL CORY & CO.,

210 Water St., New York.

Estab'lished 1847.

WHY IS IT
that the same dealers who sold the Boomer Furnace five years ago are still continuing its sale?

DID YOU EVER STOP TO THINK
that one or two years' experience with a poorly constructed light furnace always creates a demand for a furnace that has proven to be the best in the full sense of the word?

IF YOU WANT TO MAKE MONEY
buy the Improved Boomer Furnace, set it up right, please your customer, and you have the key to your future success.

REMEMBER
that a Boomer Fire Pot has never been known to crack or burn out. That it has the simplest and most effective Gas and Smoke Burner. Guaranteed the heaviest Furnace made. 84-page catalogue sent free to all responsible dealers.

HESS, SNYDER & CO., MAKERS, Massillon, Ohio.

New Uses for Aluminum

New uses are almost continually being discovered for aluminum. The latest is the most unique and unlooked for. It is nothing more nor less, says *Ironmongery*, than that a powerful explosive can be made from it. The discoverer of this attribute of this modern metal is a French chemist. He found that by taking powdered aluminum and mixing it with binoxide of sodium an explosive was created that required neither concussion nor fire to discharge its latent energies. It seems that all it is necessary to do in order to effect this is to simply place it in contact with moisture. And when it does explode it is an explosion, the flame which it sends out instantly melting even copper wire. The explanation of the peculiar manner in which the explosive can be set off is that the moisture, decomposing the binoxide, disengages the oxygen in the nascent stage, which at once combines with the aluminum with great energy, causing the explosion which follows. Its utility for industrial purposes we know nothing about. That probably has yet to be demonstrated.

— He was Particular.—"No," said Mrs. Sparrowgrass to Weary Wiggles, "I can't give you any meat or any pie, because I haven't any; but I can give you a drink of milk, if that will do."

"Is it sterilized, mum?" asked the tramp, anxiously.—*Exchange.*

THE METAL WORKER ESSAYS

—ON—

HOUSE HEATING

—BY—

STEAM, HOT WATER AND HOT AIR

With Introduction and Tabular Comparisons.

Second edition, revised. To which has been added a selection from the Letters of Criticism on the Essays as originally published in THE METAL WORKER and a chapter on Proportioning Radiating Surfaces.

"The various subjects treated on are indicated by marginal sub-headings for reference purposes, and the illustrations, computations, &c., are plain and easy of understanding. The book may truthfully be said to be a careful compilation of the best ideas of those best qualified to speak on the subjects treated of, and to form as a whole the very latest and most valuable literature on a topic which is becoming more and more recognized as being of the first importance in the building and furnishing of healthful homes."—*The Building Trades Journal.*

"It constitutes one of the most valuable works on the subject of house heating hitherto published. It is a terse compendium of practical knowledge of all that is most useful on the subject, wholly ignoring an enormous amount of useless speculation upon the subject comprised in numerous volumes and the current literature of the day—written by persons who adopt theories and vainly search for facts to sustain them—not worth the reading. *Per contra*, the work before us is alike commendable to major-domos who would be well informed on the subject, and to engineers of heating and ventilation, who cannot afford to do without it."—*The Sanatarian.*

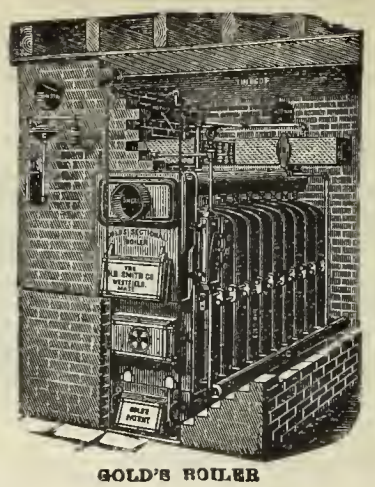
"There are fifteen essays in all, and every one of them is well worth the careful consideration of those interested in this most important subject. . . . The work is undoubtedly one of the most practical and highly valuable ever given to the public on the subject of house heating, and so thoroughly contrasts the different systems considered as to leave the subject almost, if not completely, exhausted. We commend it to the kindly consideration of all of our readers who desire the most practical views on the subject of which it treats."—*The Age of Steel.*

"Practical men have contributed of their knowledge in such a way and in such a form as to make the subject interesting as well as highly instructive, and with copious tables and diagrams showing the various methods of piping etc., the work is unlike any book published. The book treats the subject in a common-sense method and goes directly to the point without any theorizing. It is a valued work and worth the money it costs many times over. It should be read by all devotees of the systems advocated in its pages, as it deals with a subject that is becoming more and more important every year and one that demands the best thought and the highest skill of every workman."—*Register and Bulletin.*

"It is a practical book. It does not contain rules that depend for their integrity upon one set of conditions, and which may not suit any other condition. The book is for the student, and when studied it will be found surprising how much information it contains that may not appear by a superficial glance or hasty examination."—*Boston Journal of Commerce.*

The work is handsomely presented in a volume of 288 pages in the form of a handy reference book, with many illustrations, showing the several ideas and methods of heating, ventilation and economical arrangement of pipes and radiators, &c. The very complete specifications of materials which accompany several of the essays give a value to the work that will be understood and appreciated by the architect and builder who aim for excellence in this branch of house building."—*The National Builder.*

JAMES SQUIRE, *Youngstown, Ohio.*—"If we had only had the information contained in this volume in earlier life, we could now have dollars where we only have buttons."



407 pages, 7 x 9½ inches Handsomely bound in cloth. One volume.

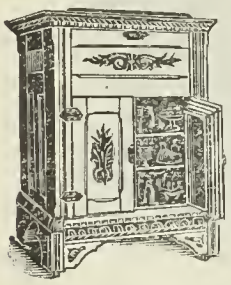
Challenge Iceberg Refrigerators,

MANUFACTURED BY

The Challenge Corn Planter Co.,

GRAND HAVEN, MICH., U. S. A.



Write for our large Illustrated Catalogue for 1895.

All our goods are made of thoroughly kiln dried ash, finished in antique with Shellac and coach varnish. Panels are beautifully hand carved. Trimmings are of solid bronze and are our own pattern. We use our own patent air tight locks, patent self-retaining malleable casters and floor plates, and patent drip cups All Refrigerators are filled with pure charcoal. The Challenge Iceberg Refrigerators are the best made for preserving all articles stored therein pure and sweet, as there is always a circulation of pure, dry, cold air. Refrigerators having water coolers are provided with bronze faucet and cup holder. All Sideboards have a fine beveled French plate mirror. We manufacture Refrigerators of all sizes from the ordinary Ice Chest to the largest sizes for grocers' and butchers' use, including the most elegant line of Dining Room Sideboard Refrigerators ever put on the market.

THE CHALLENGE ICEBERG,

THE ∴ HONEST ∴ RELIABLE ∴ REFRIGERATORS,

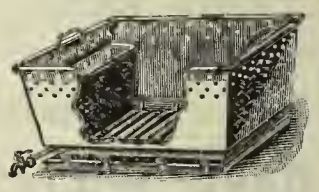
SELL THE BEST.

No. 21.

The Gurney Patent Refrigerator

is the BEST SELLER, gives the BEST SATISFACTION and PROFIT to the dealer of any refrigerator on the market. BECAUSE—It has special FEATURES, "TALKING POINTS," SELLING POINTS, not found in other refrigerators.

1. By the use of a ***Removable Galvanized Ice Compartment*** the ***"Gurney"*** can be cleaned. This feature alone assures its sale.



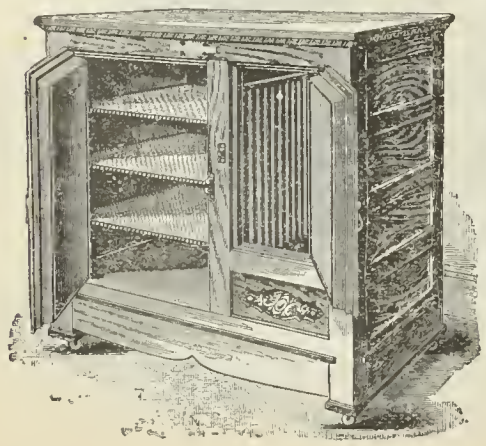
2. Under the ***"Gurney"*** principles of construction the ***lowest*** average temperature is reached with the ***greatest economy of ice,*** as fully explained in our catalogue.

3. In the ***"Gurney"*** the ice does not come in contact with the zinc side walls, thus preventing condensation or "sweating" on the inside linings, an important feature of cleanliness and durability.

4. It is packed with Mineral Wool (the best non-conductor known).

5. It has the freest circulation and dryest air, there being a large space around the four side walls of the ice compartment, thus giving about six times the condensing surface of any refrigerator.

6. In style and finish it leads all competitors.



Removable Galvanized Ice Compartment.

Send for Illustrated Catalogue and secure Agency.

GURNEY REFRIGERATOR CO., Fond du Lac, Wis.

The Automatic Refrigerator

has more good points and does better work than any other and for that reason is a better seller. Our illustrated catalogue for 1895 tells all about the line. Its advantages are:

Perfect circulation.
Large condensing and purifying capacity.
It has no flues to cause it to smell bad.
The trap is inside where it cannot be misplaced or lost.
The drip pipe may be cleaned without disturbing anything in either chamber, and is entirely out of the way
It has nine walls to protect the ice and to maintain a uniform temperature in the cooling chamber.
It has woven wire provision shelves that are superior.
It has superior hardware.
It is more capacious and convenient.
Flavors of foods will not mix.
Last but not least, it's different, and will bring new customers and new trade.

We want the leading dealers to sell our goods and but one dealer in a place.
The goods are made of ash, and well finished.
We have two factories, one in the East and one in the West, and are able to take better care of your trade than if we had but one.

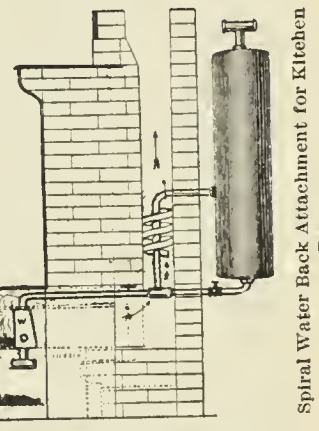
THE GLENMORE

Spiral Hot Water Generator.

(PATENTED.)

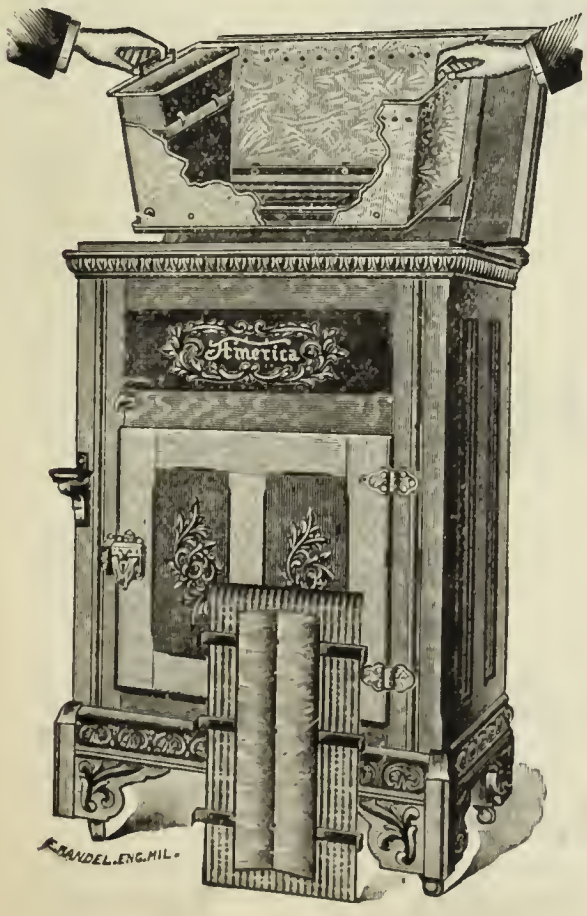
For General Heating Purposes, but Especially Adapted to House Heating.



COMMENDATORY POINTS:

Simple construction. Practically composed of two sections, consequently few joints and nothing to give out.
Large heating surfaces.
Products of combustion fully utilized.
Instantaneous generation of hot water.
Free and easy circulation.
Easily cleaned fire surfaces.
Hot water may be drawn off at any point along the pipe circuit without materially affecting the heating service.
Grate conducive to economy in fuel.

Spiral Water Back Attachment for Kitchen Ranges.



By utilizing waste heat, this water back extends the capacity of a kitchen boiler, and makes it a valuable heating auxiliary, especially in spring and fall, when the regular heating apparatus is too powerful.

A New Illuminant.

Gas fitters are likely to have their field of operations enlarged by the commercial introduction of an illuminant that hitherto has cost so much to make that, although its qualities have been for a considerable period known to chemists, it has not been considered practicable to use it for the purpose of artificial lighting. This curious substance, known as acetylene, is a gas which, in its pure state, burns freely with a rather smoky flame very much resembling in appearance the flame of a ball of cotton soaked in oil of turpentine; but, when mixed with water gas of low candle power and in the proper proportions it increases the illuminating power of the poorer gas very greatly. It makes a still better and more economical light by mixing it with atmospheric air in a manner which has been somewhat employed for burning vaporized gasoline. But it has the advantage over gasoline vapor of not condensing to a liquid form in cold pipes, which has always been a difficulty in burning gasoline vapor, except in apparatus where this vapor is first converted into a permanent gas by the action of heat.

How Acetylene is Made.

When lime is heated with carbon in a closed vessel to a temperature of from 4500 to 5000° F., a substance called calcium carbide is formed. This substance, when excluded from air, is easily kept and transported; and in these respects it is well adapted to commerce. But the temperature required to form it has only recently been obtained at a cost commercially practicable by the use of the electric furnace, and even this was out of the question until the more recent improvements in dynamos were made. Now calcium carbide can be made much more cheaply than it ever could be produced before, and in large quantities. Although it can be kept indefinitely when excluded from moisture, when it is brought in contact with water it rapidly decomposes and gives off acetylene. This, without further preparation, mixed with air, makes one of the finest illuminating gases yet produced.

Application of Acetylene.

As yet, acetylene is not produced cheaply enough to be used as an enricher in large gas works and in competition with materials now employed for that purpose ; but, as the industry is in its infancy, all precedent points to the belief that it will be still further cheapened. It is stated on good authority that carbide of calcium can now be delivered to consumers at $80 per ton, including freights ; and also that a ton of it will produce enough acetylene to mix with air into an illuminant equal in lighting power to 100,000 cubic feet of illuminating gas of 25 candle-power. Although to this must be added the interest and deterioration on the apparatus needed to effect the decomposition of the calcium carbide and the admixture of the resulting acetylene with the needed quantity of air, and also some cost for attendance, the total cost of the gas so made is now low enough to render the new illuminant highly desirable for country seats, isolated hotels, &c., remote from city gas works ; and it also may be used in lighting railway cars.

The Weather and Plumbers.

It is quite notable that no class of workmen have suffered more during the recent cold weather than the plumbers. In many cases it has been simply heroic charity to leave a shop or job where the surroundings were clean and comfortable to make repairs made necessary by the zero weather. The plumber is truly a public benefactor when he comes promptly to restore to perfect order a modern plumbing system, the luxury of which is only appreciated when it must be foregone. It requires a robust moral courage as well as a strong body to make a careful and conscientious search for the leaks and troubles due to freezing, and then under great disadvantages to repair the job. Considerable suffering must be borne in wading through the water found and enduring the soaking that sometimes comes with the thawing process. In summer this would be disagreeable, but when the temperature is benumbing, so that it is difficult to work, the plumber runs a risk to health and life for which the few dollars earned by no means compensate. Working hours have no end during the emergency, and all to benefit customers who are very likely to prove anything but thankful for the service rendered when the bill is presented.

The German Stove Trade.

A German manufacturer of stoves recently visited some of our Northern stove foundries. The comparisons drawn by him between conditions prevailing here and those of his locality in Germany are interesting. He stated that for pig iron of the same grade he pays 40 per cent. more than is paid by our foundrymen, and for fuel double the American price, but his labor costs him only one-third of the daily rate paid here. Notwithstanding the higher American wages, he found that in many instances work is done in our foundries at a lower cost per piece than in Germany. This is ascribed to the system of piece work in vogue in American factories and the vim with which our workmen perform their tasks. He stated that it would be impossible to get his workmen to move with such celerity. They go to work at 6 o'clock in the morning, stop at 8 for breakfast, which takes half an hour or more, stop again at 12 for dinner and perhaps consume an hour and a half, take another rest at 4 to check the cravings of hunger, and stop finally at 6, thus nominally putting in 12 hours of work, but actually rendering about 9½ hours. They are contented and easily managed, their contentment being largely ascribed to the pension system now prevailing in Germany. This system provides a workman with an annual pension of $125 when he reaches the age of 70, provided that he has a good record as an industrious man. Elaborate arrangements are made by which the record of each workman is kept weekly. The pension is paid by the Government from a fund raised partly by small weekly payments by the workmen themselves, partly by corresponding payments made by employers and partly by appropriations from the Government revenues. The reduction of the pension receiving age to 65 yesrs is now being agitated.

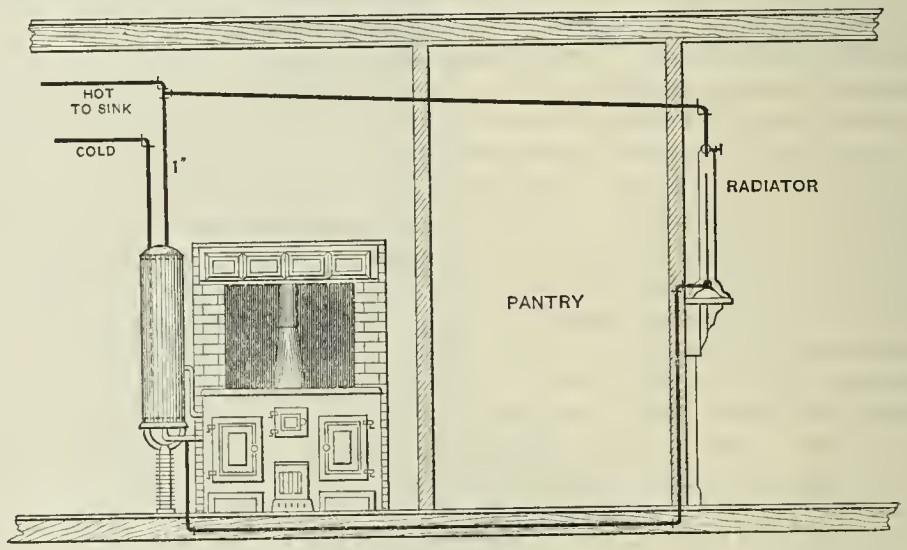
One of the attractive features of the Cotton States and International Exposition, to be opened at Atlanta, Ga., next September, will be a reproduction in miniature of the Chicago World's Fair. The exhibit is being prepared by G. W. Ferris, the builder of the Ferris Wheel, on a scale of one-one hundred and fortieth. Every detail of the great Columbian Exposition will be given, the whole space to be occupied being 75 feet in length.

THE LETTER BOX.

Electric Bell Trouble.

From C., *Connecticut* —We have an electric bell connection between two buildings which are some 200 feet apart. The battery of five cells is located within 10 feet of the push button, and seems to be sufficient for one bell, but not for two as desired. It is an assorted battery, composed of a Diamond, Sampson and one cell not marked. These have each been tested on short circuit ; also, the wires are properly insulated. The question is, shall we increase the power by additional cells or lay the battery within 10 feet of the bells? We can't put it midway.

Answer.—As the current generated by the battery must travel around the entire circuit of bells and wire back to its starting point, it will readily be seen that the location of the battery on the line in no way affects its working. Our correspondent has an abundance of battery power now; in fact, more than necessary. Three cells should be sufficient for the purpose. Where more than one cell of battery is used they should be of one make. A mixed battery seldom gives good results. If, as stated, these cells have been separately tested and each found in good condition, three of them, if of the same construction, will suffice, bearing in mind that each of them must be in good condition, as one weak cell in any number of strong ones would bring them all down to its own level. The use of an unnecessarily strong battery is to be avoided, as it is apt to burn out the contact point which touches the armature of the bell. We understand from the query that our correspondent has two bells on one circuit which are to ring simultaneously. If such is the case, one of them should be converted into a single stroke bell, as the vibrations of one bell interfere with those of the other and neither will ring. *The Metal Worker* of December 2, 1893, under the head of "Domestic Electrical Work," Chapter 2, gives detailed information on the subject of operating more than one bell on one circuit. Fig. 5 of this chapter shows the manner of changing an ordinary vibrating bell to single stroke. Our correspondent should be sure that he has but one wire under a staple on the circuit.



Cold Air Duct.

From EDWARD TRORLICHT. *St. Louis* —In *The Metal Worker* of February 2 "J. L." of Pittsburgh, Pa., requests from your readers the address of a manufacturer of air filters for furnace cold air ducts. I inclose you a circular giving description and name of the manufacturer of such an article.

Note.—The circular inclosed in our correspondent's letter is issued by the Ludlow Saylor Wire Company, St. Louis, Mo., and illustrates and describes their patent soot screen, which is a wire screen carrying a filtering fabric to prevent the entrance of dust. The screens are fitted to wooden frames, which can be removed from the cold air duct.

Will It Work?

From F. L. M., *Roseville, N. J.*—The range in a flat here makes more hot water than is needed and I want to utilize the surplus heat for heating the dining room, which is now heated by a stove. Between the kitchen and dining room there is a pantry 4 feet wide through which the piping would have to run, as shown by the sketch sent herewith. The question is, can the dining room be heated by hot water circulation from the range water back which has ample heating power? The idea is to take the brass connection out of the top of the boiler and pipe with 1-inch iron pipe to the radiator with a fall all the way to it. A ¾ inch branch will be taken from the flow pipe at the top of the boiler to supply the kitchen and bathroom. A stop cock will be placed on the flow at the radiator, and as the supply to the house fixtures will come out of the top of the flow I think that an air valve will not be needed. A 1-inch return will run from the radiator down to the floor and across the pantry and along in front of the range, close up out of the way, and will rise to the water back and connect full size. The cold water pipe from the boiler will connect into the ¾-inch opening in the tee on the return pipe. I would like the readers of *The Metal Worker* who have had experience in hot water heating to give their views on this plan. If the room was over the kitchen I know it would work. Would the radiator work as well or better if it was placed on the floor instead of on the mantel where it is out of the way. The dining room is 10 feet 6 inches by 18 feet with a 10-foot ceiling and has a large window. The pantry through which the pipes pass has a window. Should the pipes be wrapped?

Will It Work?—Section through Rooms.

Method of Heating Water.

From J. P., *Massachusetts.*—I would like to have the opinion of the readers of *The Metal Worker* on the following arrangement for supplying hot water by means of a boiler to several apartments in a building : I wish to locate a boiler of sufficient size at some convenient point, and then during the winter season heat the water by means of a coil placed at the fire chamber of the steam heater. I wish to know if a small hot water heater can be connected with the pipe from the coil in the steam heater and heat the water in summer? I should be glad to receive some assistance in the method of piping such a plant. I am thinking of putting a coil of 1¼ inch iron pipe in two parts, each 3 feet long inside of the fire chamber of the boiler, which is brick set.

Utilizing Artesian Well Pressure.

From G. L , *West Virginia* —I have an artesian well, and it has a pressure of 85 pounds to the square inch, its flow of water about filling a 1½ inch pipe. I would like to know if this water can be utilized to carry the water out of a mine situated about 25 yards from the wall and 35 feet deep, a 1-inch pipe being large enough to carry off all the water from the mine.

Note.—Our correspondent can undoubtedly make use of the high pressure of his artesian well supply to remove the water from the adjacent mine but the best method of accomplishing that result we will leave to the discussion of our readers. We would suggest, however, that some of the automatic

cellar drainers which are operated by water power might be useful in this connection. Another plan would be to run a water motor attached to a pump. This is an interesting topic, however, and we will leave it to the discussion of our readers.

A Plea for Temperance.

From VETERAN.—I was pleased to read your editorial in a recent issue on "Hobbies." It contained a great deal of useful thought in a few words. Especially I liked the reference to old men, to which class I belong, and can testify that I would be living a very unsatisfactory life if I had not a hobby. After "going through the mill" and knowing much from my own experience I am almost a crank on the subject of temperance as it applies to business men and their dealings with employees. No concern, large or small, escapes the evil of the drink habit, and too many men who could use a good influence with their workmen fail to do so from the fact that it is tiresome and unpleasant to try to reform their men. Such persons fail to see that most drinking men can be got to moderation, if not abstinence, by a systematic course of kind reasoning, together with a lesson that carries a penalty with it, which the workman knows is his own fault. I refer to not allowing a man to do any work if he is in the least under the influence of drink. A day off means a fine of $2 or $3, and it is self imposed. How can any one expect to get a roof properly soldered by a man who is half boozed with beer? He will miss lots of small seams in corners and obscure places, and this applies to any other work as well. I know that it is not the object of *The Metal Worker* to teach morals, but I also know that the interests of both labor and capital are at stake on this subject, and I feel sure that much could be accomplished by studying the characteristics of different workmen and using the right words at the right time for the good of all, including the general public.

An Appreciative Reader.

From P. STAUFFER, *Moberley, Mo.*—As the time approaches when I am about to leave my apprenticeship in working at cornice making, I would like to tell of my experience in learning the trade. The first thing I did after entering the shop was to subscribe for *The Metal Worker*, reading it through every week, giving particular attention to the pattern problems it contained, and I am free to say that no boy learning the cornice trade should be without *The Metal Worker*. I found, however, that the patterns did not come fast enough in your paper, so I saved up my money for "The Metal Worker Pattern Book," which is a work of the greatest value. Instead of wasting my time in the evenings I would study the pattern book and work out its problems, having made a drawing board according to the directions given in the book. I soon was able to cut all ordinary patterns, and the proprietor, to test my skill, gave me a chance to cut a miter, which I did successfully, and soon got other and more difficult work to do. No boy in a cornice shop should have any idle time, for when not working he should procure the necessary books and study to advance himself in pattern cutting and designing.

Are Gravel Roofs Durable?

From G. D. B., *Greenville, S. C.*—There are in course of construction in this section several cotton mills, most of them having been designed by Northern architects, who specified that they should be covered with five ply tar and gravel roofing. We know little about the durability of gravel roofing and are seeking information as to its durability and comparative cost, and believe that there is no better medium than through the columns of *The Metal Worker*, with the editor's remarks and the opinions of the readers in various parts of the country. We would just as soon put on a tar and gravel roof for a customer as a tin roof if we knew how it would last, but from the nature of the material we can form no opinion as to its durability compared with a tin roof for the same price. We can put on a gravel roof for $5 per square five ply, but can put on a better one of tin and make more money at $4 per square. We have put tin roofs on cotton mills 20 years ago and they appear perfectly good to-day. The chief objection to tin is the intense heat of the upper stories in summer. The writer has traveled some and has always observed the roofs used in the various cities. In Richmond, Baltimore, Philadelphia and New York we were struck with the great number of tin roofs. Cincinnati has quite a variety of roofs, mostly metal and slate. In Chicago hardly anything else is seen but gravel roofing. In the Gulf cities, Mobile, New Orleans, Galveston, and more particularly New Orleans, it was the exception to see a tin roof, nearly all of the roofs being of slate. This we suppose was to secure the water for drinking purposes. On the wharves there were quite a number of shell roofs, the shells being used instead of gravel on a tar roof.

Note.—We would call the attention of this correspondent to articles which appeared in *The Metal Worker* on gravel roofing on the 13th of October and the 1st of December. These do not give any information on either the cost or durability, but we hope our readers will give the result of their experience on both, as the information would be of value to a great many readers.

Heating Water by Electricity.

From J. R., *Hoboken, N. J.*—One of my customers has an office in a building which is heated by indirect steam and lighted by electricity. There is a lavatory in the office, but no means available for heating water, which he desires for lavatory use. Will some reader of *The Metal Worker* describe just how to proceed to heat water by electricity, using one of the incandescent lamps for the purpose? I know nothing of electricity, and hope sketches and description will be given so that I can get an electrician to do the work if necessary.

Making an Oil Tank.

From W. R. T., *Waynetown, Ind.*—I should like to know the proper way to make an oil tank with a partition in it for the retail oil trade, the tank to be 16 inches in diameter by 8 feet long. One of the compartments is to be filled with coal oil and the other with gasoline. My customer wants it made out of No. 20 galvanized iron. I would like to know the best way to put on the bottom and top, and also the position of the pipes. It is to have two faucets and an air valve. What is the best size pipe to use?

Purifying Cistern Water.

From EAGLE & OTT, *Ronceverte, W. Va.*—We notice in *The Metal Worker* of February 2 an inquiry from "M. A. X.," Cane Creek, Tenn., asking for information about a method of cleaning cistern water without drawing off the water. We inclose you a circular of the Perfection water elevator and purifying pump, which we think will answer the inquiry.

Can Top Wanted.

From D. M. ALEXANDER, *Westerville, Ohio*—Can any reader of *The Metal Worker* tell me where I can get a can screw that has a recess or groove in it for wax to make it air tight? I want to use it for maple syrup cans.

Cleaning Zinc.

From W. H. R.—Will you please inform me if there is any way to clean zinc?

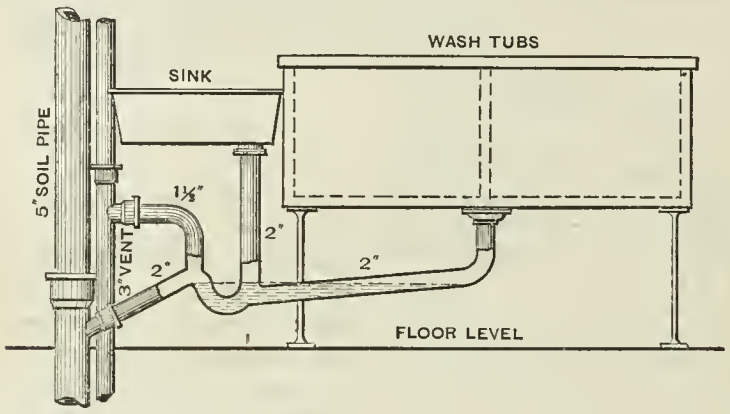
Answer.—An answer previously published to this same question was as follows: A well-known recipe book says zinc is generally mechanically pickled by scouring with sand and powdered pumice. The bath used for brass is also very effectual; it is composed of one part of ordinary nitric acid and one part of sulphuric acid and must be washed off with clean water. To larger articles which cannot be dipped in the bath of acid and water apply a solution of potassium ammonium tartrate thickened with sufficient clay to form a fluid paste. After a few hours rub the article with a brush dipped occasionally into fine sand moistened with the pickle, then polish with powdered charcoal or Vienna lime.

Enameling Gasoline Stoves.

From W. R. T., *Waynetown, Ind.*—I would like to inquire through *The Metal Worker* for the best way of re-enameling gasoline stoves. There is an increasing demand for this kind of work and I should like to know how to do it.

Insurance Rates on Gasoline Stoves.

From W. & T., *Northville, N. Y.*—Replying to "C. P. A.," Port Ewen, N. Y., whose letter appeared in *The Metal Worker* of February 2, we are using a gasoline fire pot in our shop and do not have to pay extra insurance. Our rate is $16.60 per $1000. We asked our agent for a permit to use the gasoline fire pot, and he said, after seeing the pot, that we did not need one.

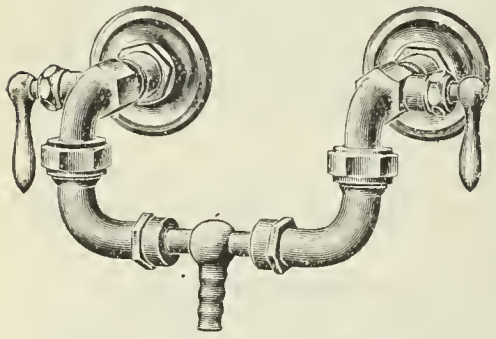


Anti-Freezing Mortar.

From C. S. L., *New Jersey.*—Please inform me if there is not a recipe for making mortar for cellar walls that will not freeze. Is not salt sometimes used in Canada for this purpose, and if so what are the proportions?

PLUMBING and GAS FITTING.

Example of Faulty Plumbing.



From H. D., *New York.*—Inclosed you will find a sketch showing a sample of plumbing work which has recently come to my notice and which, in my opinion, reflects seriously on the intelligence of the parties having the supervision of the work. The defective portion consists of the connecting of the waste from the tubs below the inside crown of the sink trap, therefore causing a larger amount of stagnant water to remain in the pipes than is necessary. The diagram will make this very clear to the uninitiated. Further comment is unnecessary.

Example of Faulty Plumbing.

Kelly Extension Slip Joint Connection.

We show in the accompanying illustration a device recently invented by Thomas Kelly & Brothers, 124 Franklin street, Chicago, Ill. The connection is used to unify two single bath cocks, and so convert them into a combination or double bath cock. No solder or fitting is required, for by screwing up the nuts a rubber ring is extended. It can, we understand, be made so tight by hand that it cannot be pulled off. The joint is 6 inches when closed, and will extend to 9 inches when opened full. Messrs. Kelly & Brothers saw the necessity of a connection of this kind when they introduced their shower bath ring.

The Kelly Extension Slip Joint Connection.

An error was made in the name of A. L. Brown, Norfolk, Conn., in the description of "A Suburban Water Supply," in *The Metal Worker*, January 12. Major Middlebrook of Bridgeport and Mr. Brown are old acquaintances and authorities on hydraulic ram work.

Sanitation.*

BY ROBERT MORGAN.

Out of the vast number of questions pressing upon civilized communities for recognition and solution, none is more urgent in its demands, or more inexorable in its revenge if neglected, than sanitation. If met with proper consideration and its demands complied with, it becomes a most powerful ally in the cause of civilization and progress. Disregard its commands and it becomes a merciless scourger, destroying alike the helpless infant and the ignorant or neglectful adult. Where large communities are congregated together its demands are most imperative and in these later days our ears have been opened to its warnings. The chemist in his laboratory, the physician in his office or in our homes, the plumber in his daily round of business have taken up the warning note and already people in all quarters are heeding the cry. Humanity calls loudly for the protection and preservation of health, without which life itself loses its value and its charm.

There are "many gates to death," but few are left wider open than those leading to the dwellings of mankind when unlocked by such skeleton keys as foul gases, bad air, impure water, &c. Is it not astonishing that while nations will draw heavily on the resources of their countries to train men in the arts of war for the purpose of protecting life and property from the ravages of the enemy, they do almost nothing to teach the people how to protect themselves against the constant ravages of disease and death? Where are the magnificent sanitary science halls erected by the Government where willing students perfect themselves in the knowledge of sanitary engineering and plumbing? It was no doubt the design of an Allwise Being that all men, rich or poor, should share alike in the enjoyment of pure air and pure water. Do they? The rich man can afford to pay for all such appliances as tend to secure these blessings for himself, and he may select any location to build his home that he chooses, but the very poor have neither the power nor the means to get an equal share with their favored brethren. They must take what their small means will enable them to pay for, and that is so little as to astonish us when we come to know about it.

Look at the sanitary conditions of the tenement house district of almost any populous city. What are the provisions for ventilation, for bathing, for drainage? Mostly conspicuous by their absence or inadequacy. And yet the very poor usually pay more in proportion for two small rooms in such barracks as these than a man of moderate means pays for three times the number of rooms furnished with some sanitary appliances. No use to blame architects for the ill-constructed buildings and bad drainage referred to. Probably no architect ever saw a plan of most of them. When houses are unfit for occupation by reason of their lack of sanitation the strong arm of the law should be applied to effect a remedy. If every man who loves his fellow man would lift up his voice to protest against this injustice to man the local or State government would soon find means to compel the renovation of unsanitary buildings, the erection of new ones on sanitary principles and the provision of ample public baths in neighborhoods where private baths are unknown because too costly for tenement house purposes. Cleanliness may not promote godliness, but it will tend toward self respect and consequent morality. A house becomes more valuable by making the plumbing and drainage perfect, so the landlord reaps a benefit as well as the tenant, and where the owner refuses to place his houses in proper sanitary condition the law should step in and either compel him to do so or deny him the privilege of renting them.

Another point that needs restriction by law is the practice in large cities of constructing buildings of excessive hight, resulting in many instances in the complete exclusion of the direct rays of sunlight where the streets are narrow, leaving them little better than damp, unwholesome passages. Allow the gutters of such dark streets to become the receptacles of refuse, as so often happens in large cities, and they soon become the breeding places for fevers, diphtheria, &c. Street cleaning, though supposed to be regulated by law, is too often a farce. It has been remarked that we have as good laws as any nation, but the trouble is that they are not always enforced. I believe that the construction of lavatories and toilets similar to those under ground in the city of London, placed in crowded centers of trade, with an attendant in charge of each, would be a means conducive to health. Much might be done to improve the sanitary condition of the pavements in cities. Any pavement that is not water proof will absorb refuse matter and become a menace to health. The question of disposing of

* Presented at the Waterbury convention of the Connecticut State Association of Master Plumbers, February 6, 1895.

garbage is now occupying the attention of scientists and humanitarians. Thus far, no better, cleaner or safer way has been devised than burning, which not only commends itself as being a sanitary measure, but economical as well, when the health of the people is taken into consideration.

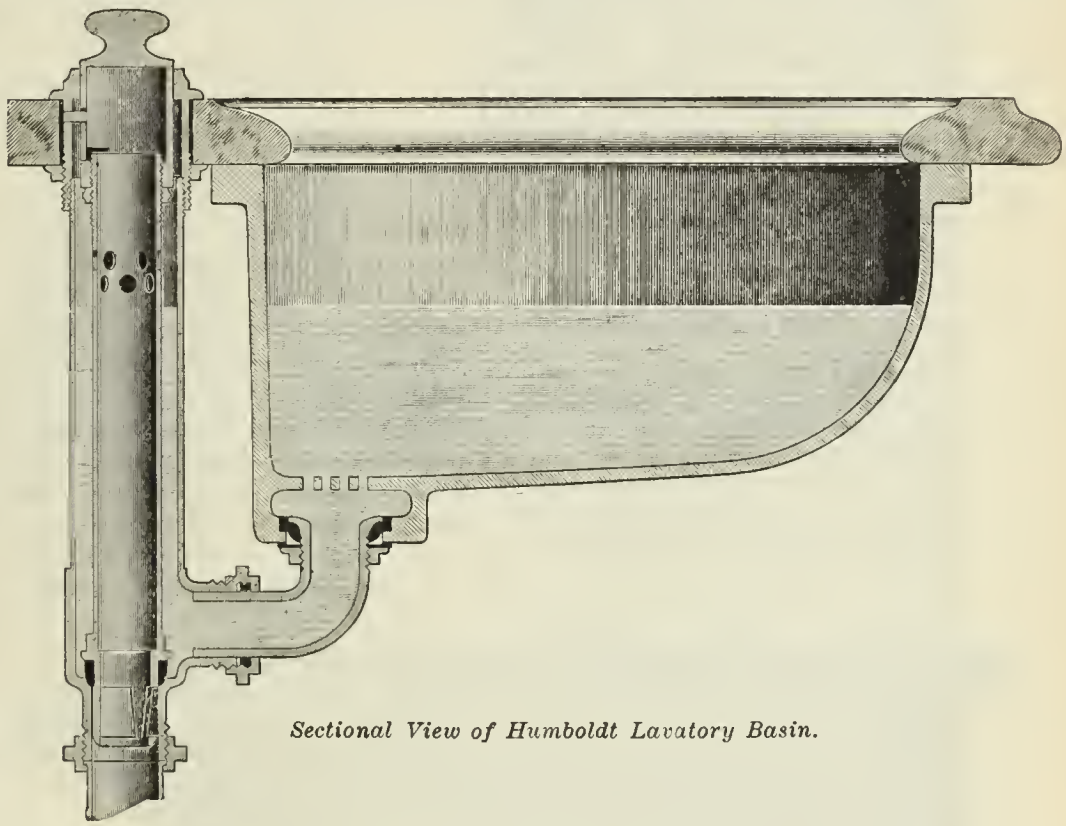
A constant and sufficient supply of good water is of the first importance to every community. A high standard of health can only be attained by a good degree of cleanliness, and cleanliness can only be preserved by a free use of water, and free use does not necessarily mean waste. Water at public drinking places should be carefully filtered and the filters should be cleansed at frequent intervals. The reading and thinking public is already awake to the requirements of sanitation. But what is to be done with those who will not read or think, since there is no law that I know of to compel people to save their own lives? However, I should say place baths and sanitary appliances within the reach of all, and man being an imitative being he will be likely to follow the example of others and thus get the good which he has not the knowledge to demand. Nor do I believe that the construction and maintenance of public baths in the tenement house districts by cities would add greatly to taxes. The first cost would be considerable, but the returns in lessened expense of maintaining almshouses and prisons would be something. Nothing is so expensive as crime, and filth tends to degrade, and degradation leads to crime. Cleanliness stimulates self respect and tends to good citizenship. If we make laws to restrain and prevent crime, why not also furnish means to elevate and purify character?

The introduction of the study of hygiene into the public schools will in a few years bring about desirable practical results. It has been said that a plumber cannot afford to be a reformer. Is it true that our profession is to us but a matter of dollars and cents? Have we then no interest in our fellow man except to find our way neatly and directly to his purse? Shall we allow such a stigma to rest upon us? Let us stamp out whatever of avarice and ignorance in our ranks may have led others to believe that we are not at heart just as desirous of progress and reform in the plumbing trade as any critic could wish us to be. Then, having conquered, let us place ourselves in the vanguard of humanitarians and be heard loudly knocking at the doors of legislative halls, urging the passage of such laws as will compel men—landlords and plumbers alike—to consider the health of the communities which they desire to serve.

In some places the aid of the law has been invoked, chiefly through the efforts of Health Boards and plumbers, to oblige a compliance with such sanitary conditions as will best secure the health of the people. Let us unite in the endeavor to carry the good work still further and aim to secure such legislation as will oblige all persons engaged in plumbing work to be thoroughly and practically qualified to do their work in a manner to prevent disease and preserve health. When all plumbers make united effort to uphold only the best work, then, and not till then, will our trade become an honorable profession.

The examination of those who wish to do plumbing, by a competent board, and their registration, together with the issuance of certificates to those candidates who passed satisfactory examinations, would, no doubt, secure almost immediate improvement not alone in sanitary methods, but in the execution of the work. A plumber should understand not only the practical part of his work, but the theoretical part also, and be able to give a sufficient reason for the construction of every part of his work. To quote the language of another: "As the wave of popular interest in plumbing is sweeping over the land, I would strongly advise the young apprentice to put forth his best efforts to acquire a full and complete knowledge of the craft, and not to rest satisfied until he can not only give a satisfactory reason for every process of his work but also illustrate it with his pen and pencil."

Much poor material is now to be found in the market and many people resort to the penny wise method of using it, consoling themselves with the reflection that, after all, it may wear just as well as the more expensive. This is a kind of logic that appeals powerfully to some persons who put up houses to rent, but experience is teaching them that the putting in of poor material must always result disastrously in the end, both to the health of the tenant and the purse of the landlord.



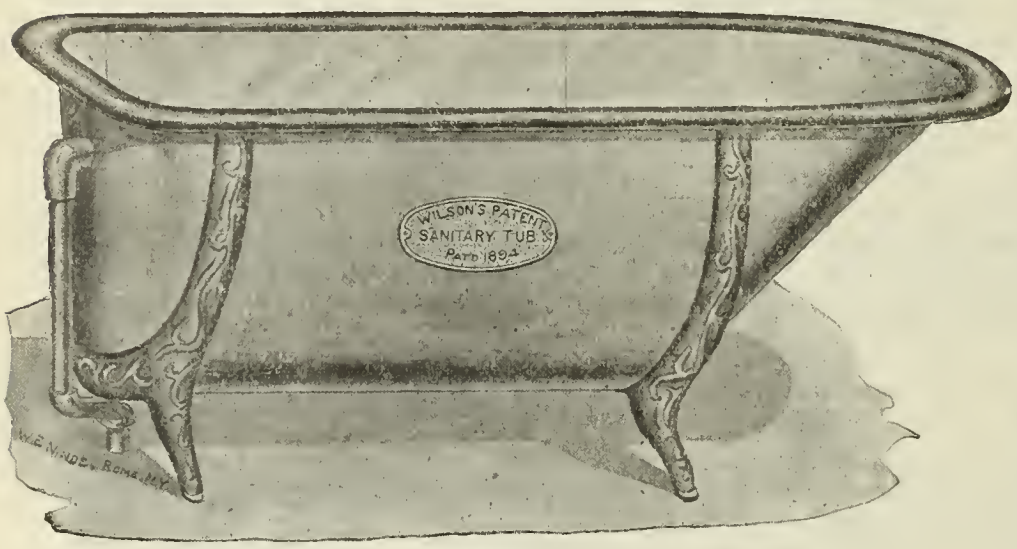
The Humboldt Lavatory Basin.

The sectional view herewith given shows the Humboldt lavatory basin, made by Sumner & Goodwin, 21 Oliver street, Boston, Mass. The basin, it is stated, has no nickel plated work exposed in the fixture, and consequently there is no tarnishing or wearing away of the metal. A particular advantage to which attention is directed is that there is very little surface between the perforations at the bottom of the basin and the waste at the back to foul. The disagreeableness, if not absolute danger, of a large fouling surface between the fixture and the trap is becoming more and more recognized, and the reduction of this surface so far as possible is an advantage that will be generally appreciated.

T. F. Mullarkey, Gloversville, N. Y., has resumed the plumbing business at the place formerly occupied by the firm of Mullarkey & Senior.

New York Master Plumbers.

The annual ball of the Association of Master Plumbers of the City of New York was held in the Lexington Avenue Opera House on February 12. The committee of arrangements, John Yule, Thomas J. Cummings, Thomas J. Tuomey, Charles Schloesser and Milton Schnaier, provided a very enjoyable entertainment for the early part of the evening with quartettes and solos. An impersonator appeared as Gen. Geo. D. Scott, John Price, T. J. McCormack and Alderman J. G. Collins in quick succession to the amusement of these gentlemen and the audience. Among the guests were John Mitchell, president of the National Association of Master Plumbers, United States Marshal J. H. McCarthy and Wm. P. Mitchell from New York; Thomas H. Radcliffe, Wm. J. Gault, E. McDonald and H. M. Noble from Brooklyn. All of the guests were accompanied by ladies as were the members, and after the entertainment the orchestra began an elaborate dancing programme. The ball was opened by John Yule. The members present with their wives, daughters and friends were: Milton Schnaier, chairman of the Floor Committee; Henry G. Gabay, Thomas F. Gaynor, J. G. Collins, C. Tucker, I. Brown, J. Tuomey, T. R. Delacey, J. M. Morton, Gunstave Staats, Charles Beck, Benjamin Chambers, Paul Euell, Leonard D. Hosford, David Kennedy, Abraham Levon, James Muir, William McDermott, James McEntee, H. J. Pattison, I. Reynolds, John Regan, John J. Sullivan, William Young, William Bryan, Thomas F. Byrne, Samuel Cameron, Peter Carroll, T. J. McCormack, P. J. Carpenter, T. J Cummings, J. P. Knight, J. Ryan, J. J. Delehanty, P. Green, Jonas A. Rossman, John Byrns, Alexander Bryant, James R. Corbitt, Walter G. Gersty, C. H. Kranichfelt, William Kirchhof, Josiah Lindsay, Samuel Malcolm, John F. McKeon, Joseph O'Brien, William H. Quick, John Rinehan, Michael Ryan, John Tucker, Paul S. Bolger, Oliver Barratt, Benjamin Chambers, J. A. Chambers, L H. Stroh, P. J. Andrews, William R. Bracken, Philip Brady, Alexander Cameron, John Boyd, James Gilroy, William Vail, Adam Huston, George W. Flood,

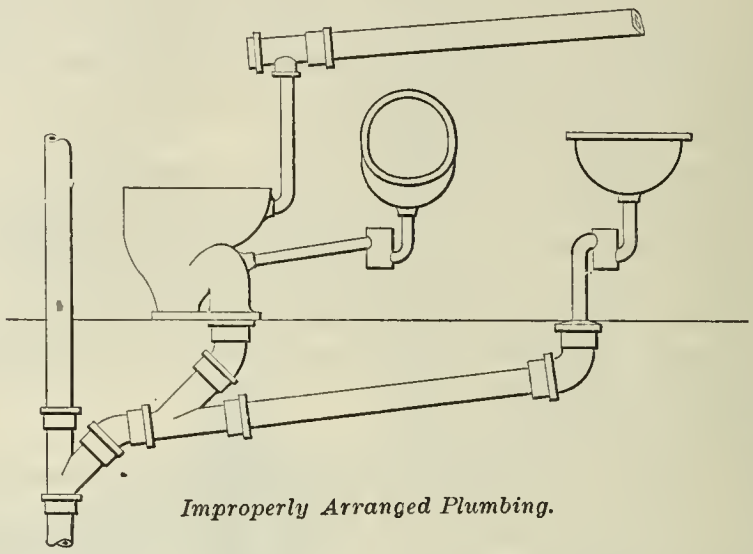


Sectional View of Humboldt Lavatory Basin.

John Spence, David Jackson, Thomas Brady, J. H. Connolly, John S. Dunn, Ferdinand Ehrhardt, Frank Eberhardt, William Forster, James Fay, John H. Graham, John F. Muir, William Messer, James O'Brien, Charles A. Walsh, Thomas J. Tuomey, J. M. Sullivan, B. J. Smith, Frank Flanagan, Patrick Brady, Thomas J. Byrne, Francis Callaghan, Colin Campbell, George D. Scott, James N. Knight, John Ford, John Hindley, William Martin, John Miller, George B. Brown, James Armstrong, William J. Crow, Paul G. Decker, Thomas Ennis, George F. Erfort, Cauldwell Fraser, Benjamin Forster, Edward Murphy, Edwin A. Moody, William Montgomery, John D. Page, Charles H. Treat, John Smith, Charles Schloesser, Michael Hughes, Bartholomew Donohue.

A Copper Bathtub.

A new sanitary fixture that has just been put on the market is an all copper bathtub, shown in the accompanying picture, made by R. M. Wilson, Rome, N. Y., and displayed at the New York showroom at 92 Walker street. The tub is made of heavy weight sheet copper, so that it sustains the weight of the water and the bather without affecting its shape. It is claimed that a heavy man may jump into it without damage to the tub. On the inside the tub is heavily tinned, while the outside shows the copper in its natural color, under a coat of durable lacquer, presenting an attractive appearance. The tub may be painted any color and decorated to suit its surroundings. It is supported on ornamental cast iron legs that are bronzed. Each tub is supplied with a fixed waste and overflow, and is adapted to the use of standard bath cocks. Wood rims of any wood required are provided. The tub is placed on the market at a price that should prove popular, and being an exposed or open work fixture it has much to recommend it in appearance and cleanliness.



A Copper Bathtub.

Improperly Arranged Plumbing.

From F. A., *Connecticut.*—I send you a rough sketch of plumbing work that has just been completed in a new building. It will be seen that the waste from the urinal runs into the trap vent of the water closet and that the traps are not ventilated. The seat vent runs into a flue. I should like to know if this can be called correct plumbing?

Answer.—The system shown is open to many criticisms. In some sections the seat vent is never used, while in others it is connected with a heated flue. It is generally considered that a first class job of plumbing should have its traps ventilated. A novel economy is effected by connecting the urinal waste with the closet, as shown, but it would not be considered good practice. In the sketch the soil pipe is shown continued to full size to where the basin waste connects with it. This should not be. The soil pipe should be reduced to the size of the basin waste immediately after receiving the water closet waste. The waste from the urinal should connect with the waste from the basin. By the use of a pipe of the size of the waste of these two fixtures, a good flush will be insured each time the fixture is in use. If there are no fixtures attached to the vertical soil pipe above those shown in the sketch, it may be used as a vent pipe. A separate pipe, the same size as the waste used with the fixture, should be taken from the top of each trap and carried to a point that is higher than the fixture, and then run over and connected with the vertical soil pipe. If other fixtures are located on this pipe above those shown, the air pipe must be run above them to the soil pipe or carried through the roof.

Improperly Arranged Plumbing.

TRAPS AND VENTS.

THE PLANT now under erection by the Victor Mfg. Company, at Blairsville, Pa., is nearly completed. The new concern will make a full line of porcelain enamel baths and enameled sanitary ware, also enameled specialties of every description. Their plant will be a very complete one, and will include pattern shop and foundry. The concern received five acres of ground and a cash bonus from the citizens of Blairsville in consideration of their locating the plant at that place.

THE ECONOMICAL GAS GOVERNOR COMPANY have been incorporated at Chicago with a capital stock of $250,000. The directors are Abijah O. Cooper, Frank C. Farnum and Edward L. Bradbury.

REPRESENTATIVE REINOEHL of Lebanon, Pa., has introduced a bill to the legislature at Harrisburg to provide for a "Sanitary Day." The object is to arouse public interest in sanitary science, and through the co-operation of the Superintendent of Public Instruction and the State Board of Health to impress all with the necessity of cleanliness as a means of averting disease and preserving health.

J. BARTON has purchased the tinning and plumbing business of Frank Shay at Pine Plains, N. Y.

FREDERICK WEISS, Chicago, has bought the plumbing branch of Louis Back & Co.'s business.

HERBERT MORRIS and George Shainline, employees of Cowden & Zimmerman will form a co partnership and engage in the plumbing business in Conshohocken, Pa.

A SPECIAL COMMITTEE, composed of Chairman Mowe of the Plumbing Board, City Engineer McComb and Plumbing Inspector Kieff, has been appointed at Watertown, N. Y., for revision and consideration of several changes recommended in the plumbing rules and regulations as laid down by the local plumbing board, as suggested by their examination of the laws in force in Syracuse.

GRAND CROSSING PLUMBING COMPANY have been incorporated at Chicago with a capital stock of $1000. The incorporators are Parke E. Simmons, Guy C. Murray and Ernest Rutishauser.

THE ANNUAL MEETING of the Master Plumbers' Association of Worcester, Mass., was held at the Builders' Exchange last week, and the following

officers were elected for the ensuing year: President, C. C. Reed; first vice-president, C. A. Middlemas; second vice-president, F. J. Briden; secretary, J. J. Crean; treasurer, O. S. Kendall.

GEO. A. FUCHS, Fort Madison, Iowa, has sold out his plumbing business to the Fort Madison Plumbing Company.

W. F. DOWD & Co., Raleigh, N. C., is the style of a new firm who will open a plumbing business. Mr. Dowd comes from Charlotte.

THE PLUMBING SHOP of Charles G. Carmine, Baltimore, Md., was damaged by fire last week.

THE FOLLOWING PLUMBERS of Jamestown, N. Y., have complied with the law and registered with the clerk of the Board of Health: Frank M. Stearns, Carl J. Berry, Martin J. Murray, Charles T. Taylor, Fred E. Underwood, George A. Chatfield, John F. Smith, Jonas Woodhead, John Conway and A. A. Stewart.

THE ANNUAL CONVENTION of the Master Plumbers' Association of the State of New York will be held in Troy, N. Y., Thursday and Friday, March 7 and 8, and the committee appointed by the local association are now busily engaged making the arrangements. The convention will probably be held in Harmony Hall, and the first day's proceedings will be followed by a banquet.

D. J. CARROL, President of the Alberene Stone Company, has been in Chicago for a few days.

WILLIAM W. GRAY has recently started a plumbing and heating business at Chatham, N. Y., with a full assortment of plumbing fixtures and Bolton Heaters.

THE ANNUAL CONVENTION of the Master Plumbers of Rhode Island was held at Pawtucket last Thursday. John Trainor of Baltimore and one of the executive committee of the National Association of Master Plumbers was one of the guests.

THE FIRM of Haage & Tomney, Reading, Pa., plumbers, will be dissolved after April 1. The business will be continued by Mr. Haage.

A BRANCH of the well-known firm of Crawford & Young, plumbers, of 321 Warren street, Boston, Mass., has been established at 18 Post Office square, Roxbury, Mass., formerly occupied by J. H. Baguley, plumber.

C. H. GREEN, South Bethlehem, Pa., had a slight fire at his plumbing shop last week.

THE MASTER PLUMBERS' ASSOCIATION of Salem, Mass., met last week and elected the following officers for 1895: President, F. A. Wendell; first vice-president, E. G. Kelley of Peabody; second vice-president, D. S. Ingersoll of Beverly; secretary, James Trow; treasurer, J. F. Andrews.

THE PLUMBING WAREHOUSE of Leighton, Davenport & Co., Bangor, Me., sustained considerable damage by fire last week.

J. G. YOUNG, hardware dealer, Bellevue, Iowa, has added a plumbing department to his hardware establishment, and would like catalogues and price lists from dealers in plumbing supplies.

JAMES GRAY, East Albany, N. Y., was a visitor at *The Metal Worker* office this week. Mr. Gray is the patentee of an extension sink bracket, and manufactures a number of plumbers' cast iron specialties.

IN THE LAST ISSUE of *The Metal Worker* we alluded to the formation of the John W. Mills Company, 100 Lake street, Chicago, to do steam and hot water heating work, but omitted to state that they would also follow the business of contracting in ventilating work and sanitary plumbing.

THE E. STEBBINS MFG. CO., Brightwood, Mass., send a calendar upon which attention is called to their extensive line of brass faucets. These are referred to as being of the highest grade and as adapted to use in modern plumbing.

THE PLUMBING ESTABLISHMENT of W. S. Molo, Dubuque, Iowa, was visited by fire last week.

THE NEW FIRM of Carter & Co., plumbers, have their offices in the Reich Building, Brighton street, New Brighton, Pa.

W. A. FAUST, 3 Cron street, Pittston, Pa., is a new plumber, steam and gas fitter in that city.

EDWARD P. WILLIAMS, a member of the firm of Williams & Calhoun, plumbers, Amsterdam, N. Y., died last Saturday evening of typhoid fever.

PLANS have been completed for a four-story brick factory on American street, below Columbia avenue, Philadelphia, for Fleck Bros., manufacturers of plumbers' materials. The building will have a frontage of 22 feet on American street, and will extend back 132 feet to Philip street. A siding will be laid into the building from the Reading tracks, and the factory will contain improved machinery.

GOULD & NOWLEN, Bath, N. Y., will open a branch plumbing establishment at Hammondsport in the near future.

THE FOURTH ANNUAL CONVENTION of the Ohio State Association of Master Plumbers will be held at Columbus, commencing on February 26 at 10 a.m. Smith's hotel will be the headquarters.

Massachusetts Master Plumbers.

The seventh quarterly convention of the Massachusetts State Association of Master Plumbers was held in Boston on February 12. The business meeting was held in Elks' Hall, and was followed in the evening by a banquet at the Crawford House, which was one of the most enjoyable events in the history of the State Association, it being characterized by a thoroughly representative gathering of the members of the craft, an elaborate dinner, charming music and timely speeches. The convention which preceded it was notable for the large attendance and the many important matters acted upon. The principal feature of the meeting was the discussion and denouncement of the efforts now being made by certain parties to change the present plumbing laws of the State. These attempts were declared dangerous to the public welfare and the interests of the plumbing trade.

It was 6 o'clock when the delegates and guests filed into one of the large dining rooms of the Crawford House. There were about 200 master plumbers present. David Smith, president of the local association, sat at the head of the table, having on either side the invited guests, among whom were Capt. John S. Damrell and leading representatives of the plumbing trade, manufacturers and dealers. An orchestra rendered delightful music during the banquet. When cigars were lighted President Smith called the gathering to order and extended a cordial welcome to the visiting delegates. He then introduced as the first speaker John Trainor of Baltimore, ex-president of the National Association.

Mr. Trainor, who was received with prolonged applause, made a timely speech, dwelling upon the merits of the association and what it had accomplished since its existence.

The next speaker was Daniel G. Finnerty, one of the best known men in the plumbing trade.

Capt. John S. Damrell spoke for Boston. He complimented the association on the showing and the progress it had made, and was given three cheers when he had finished.

Other speakers were president Mitchell, Wm. Lumb and Wm. Locke. One of the best speeches of the evening was that made by James F. Davlin of Somerville, whose remarks sparkled with wit and allusions to several master plumbers present. Daniel Shannon, secretary of the State Association, sang a song for the "boys," which was loudly applauded. Brief remarks were made by other representatives of the trade from all over the State, and the banquet was brought to a fitting close with the singing by all present of "Auld Lang Syne."

THE GILBERT & BARKER MFG. COMPANY are about to move their New York office to 82 John street, where, in addition to the Springfield gas machine and their line of gas appliances, they will have something new to show that will interest plumbers. It is a gas water heater which is intended to take the place of a waterback and boiler, and can be connected with the water service pipe under any pressure. By opening and closing any of the faucets on the hot water service the heater is lighted and water at 120 to 130 degrees is delivered at the rate of 1 gallon per minute.

The agricultural interests of Florida have experienced a crushing loss by the almost unexampled freeze of last week, following on that of six weeks ago. The best authorities estimate that 75 per cent. of the orange trees in the State have been killed, with two-thirds of the pineapple plants and nearly all the early vegetables. Altogether the loss to growers on the peninsula is computed to be not less than $15,000,000. Next year's orange crop, which was estimated at 6,500,000 boxes, will not, it is predicted, fill more than 100,000 boxes. California has escaped the cold wave, and her orange yield of about 2,800,000 boxes will accordingly bring the growers a handsome profit.

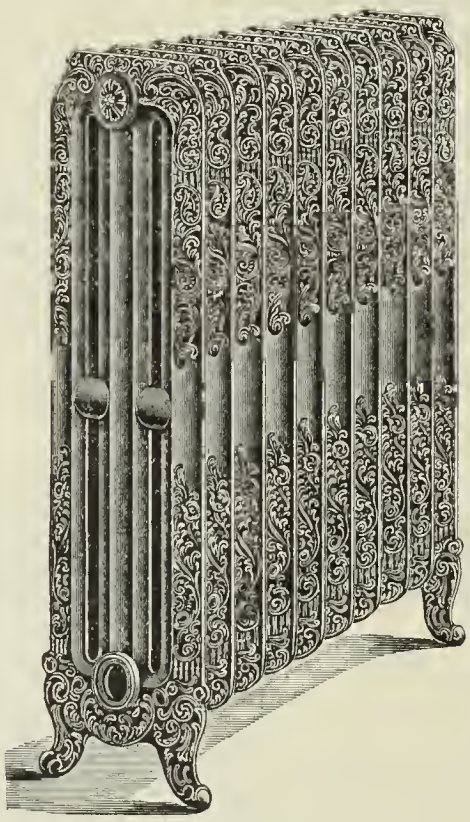
The value of merchandise exported last week from the port of New York shows a gain of $2,400,000 over that of the previous week, when it touched the lowest point for the past two years. It was also considerably above the figures for the corresponding week of 1894, but the comparison with import figures exhibits a heavy balance of foreign trade against this country.

Austin Corbin, the railroad magnate, has, it is said, arranged to colonize 4000 acres of land in Chicot County, Ark., with Italians.

STEAM AND HOT WATER.

Mechanical vs. Natural Ventilation.

BY F. B R.



The relative efficiency of mechanical methods of ventilation in which a fan is almost universally employed, and natural systems which depend for their action upon accelerating coils, is not generally appreciated. The losses in the process of making steam in the boiler, of transforming it into work in the engine, and therefrom developing the necessary air movement by means of the fan, are serious and the actual efficiency of the combination is very low. So low, in fact, that one who has not investigated the subject would hardly believe it possible that the blower is nevertheless the more economical of the two means named above. The operation of moving air by natural methods, by its very simplicity, is deceptive. Nothing can apparently be freer from complication than the process of heating air by means of a coil within the flue, thereby decreasing its density and creating an air movement from the apartment outward, because of the difference in the weight of two columns of air by equal hight. It is upon this basis, however, that the capacity of a flue is determined, for it may be readily calculated from a knowledge of the internal and external temperatures, the hight of the flue and the temperature within it.

Under practical conditions the expense of moving the given volume of air may be best expressed in heat units. Thus, for instance, may be measured the steam condensed in an ordinary accelerating coil, for, knowing the increase in temperature of the air volume, we may readily inform ourselves regarding the number of heat units required therefor, and the consequent condensation of steam, the sole source of this heat. Likewise the actual power required to directly drive the fan may be ascertained, which, duly corrected for the losses of efficiency in engine and fan, may be easily expressed in heat units and compared with the expenditure for an equal air movement by the accelerating coil. Relative efficiencies between fan and coil will vary greatly with the necessary difference between flue and outdoor temperatures to produce the desired result by the so-called natural method. If this difference is slight the efficiency of the flue will approach nearer to that of the fan, but under all practical conditions the fan will be found to produce the given movement of air with from one-tenth to one-twentieth of the heat expenditure necessary with an accelerating coil. The heat added to the air in the flue in order to produce its movement is all deliberately wasted so far as heating is concerned, for it is supplied to the air after it leaves the apartment and is thrown away with it. The fan, however, may be applied as a portion of the heating system of which the other can form no direct part and compel the discharge of air from the building by the pressure maintained within.

In almost any case a fan blower can be purchased and installed, not including motive power, for less than the cost of the accelerating coils it would displace. It combines within itself the capacity of all of the individual coils without the inconvenience of their separation and the difficulties of their proper operation. Of course the fan cannot be utilized in small buildings, owing to the usual lack of motive power and proper attention, but its advantages should certainly not be overlooked in those structures where ventilation on a large scale is desired.

The St. Louis Three-Column Radiator.

The illustration presented herewith shows the St. Louis three column radiator for steam and hot water, made by

The St. Louis Three-Column Radiator.

the St. Louis Radiator Mfg. Company, Union Trust Building, St. Louis, Mo. It is the specialty that the company are pushing, and they direct special attention to its handsome appearance, the design being in the Rococo style, as shown in the illustration. Particular claims are made for a large heating surface per section and the small amount of water it carries. The radiators are made in from 3 to 30 sections, measuring from 7½ to 75 inches. They are made in hights of 38, 32, 30, 26 and 20 inches, the three-section 30-inch radiator containing 12¾ square feet of heating surface. The width of the sections is 9 inches.

C. R. Meres Mfg. Company, Norwalk, Ohio, are about putting on the market an apparatus which can be used for either steam or hot water in portable or brickset form. It is of the water tube construction, and arranged to secure either a direct or indirect draft. The construction provides for an easy cleaning of the flues, and the heater is said to be very sensitive to the fire.

Ventilating Schools.

BY SAMUEL HEINS, RONDOUT, N. Y.

Reading over *The Metal Worker* of February 2 I see an article on Heating and Ventilation of Public Schools, written by T. J. Waters of Chicago. I would like to say a few words on the subject of ventilation of public schools, something which is of great importance for the benefit of the pupils and teachers. How many schoolhouses are thoroughly ventilated. I have invented a plan by which schoolrooms and all other rooms may be ventilated without any draft, and which distributes fresh air all over the room. This is a subject that all builders should give their especial attention to. How many children are sent home sick from school by inhaling the polluted atmosphere of unventilated schoolrooms, which I consider is the deadliest poison they could swallow. This subject excites much interest, and, as I said above, I have invented a plan which does away with drafts without any expensive appliance. It is extremely simple and cheap, and it continually renews the atmosphere without being felt by the occupants of the room. Two ordinary panes of window glass are placed in the upper frame of one or more windows, as follows: One pane, the outer one, is placed in the sash and held in place as usual by glazier points and putty. The only difference from an ordinary pane is that it is about 2 inches too short and raised that much from the bottom, leaving the lower edge free and being held in place by the end and the two sides. A second pane, the inner one, is placed against the molding of the same sash, which is always wide enough to admit of its being used for this purpose. This glass is also cut about 2 inches short, but is adjusted so that the open space is on top. This pane is held in position by the lower edge and the two sides. The space between the two panes should not be less than ¼ inch. It is, however, regulated by the thickness of the frame work and the depth of the inner molding. The inner pane should be movable and so arranged that it may be taken down and replaced rapidly and without danger of breakage. This result is arrived at by placing over the edges of the inner pane a light U shaped rubber rim, which is arranged to have sufficient adherence to keep the pane firmly in place. The inner pane thus protected is then put in place, and secured to the molding by means of small clamps attached to the frame by small screws. For medium size windows two clamps near each corner and one clamp on each side near the center. It may be that the pane should be cut so that the rubber rim rests against the frame, then by special clamps the pane is held firmly in place and cannot rattle or break. This system of ventilation, with its parallel glass panes and opposite openings, di-

rects a continuous stream of air vertically toward the ceiling of the room, which accounts for the excellent results of this contrivance, and ventilates or airs a room without the least draft. By this arrangement all the pure air needed is secured and there is no foul air left in the room. The inmates do not have langour, headache or lassitude of body. I would recommend that boards of education adopt this simple method. The expenses would be very little and it would save the health of teachers and pupils. I hope this will be given space in your valuable paper for the benefit of the public.

Determining Heating Power of Heating Systems.

From SUBSCRIBER, *Winnipeg, Manitoba.*—In *The Metal Worker* of January 26 I notice a paper read by J. H. Kinealy before the American Society of Heating and Ventilating Engineers, on the heating power of heating systems, and as it is a topic of general interest to the trade I thought another method might be of interest to your readers. The following method is one which the writer has used with fair success for some time past.

Given a room 15x10x10 feet, with 25 square feet of exposed glass and 250 square feet of exposed 8 inch brick wall, to heat from zero to 70° above with an average temperature of 200° in the radiators, providing only one change. On calculation we find that this room requires about 7786 units of heat per hour to maintain its temperature at the required standard. The heat units emitted per square foot per hour by direct radiators. temperature 200°, with air in room at 70° quiet, are stated to be 246.13, so that 7786 ÷ 246.13 = 31.6, the number of square feet required to heat this room thoroughly.

After installing the system as based on the above calculations, we find we cannot get weather colder than 10° above zero, and with this temperature we determine to test the system. Again taking the same room, but to heat from only 10° above zero to 70° above, we find that it requires only about 6674 units of heat per hour. But we have already placed in this room 31.6 square feet, so that we will now have to maintain this radiation at a temperature sufficiently high only to emit 6674 units of heat, the amount necessary to warm the room; 6674 ÷ 31.6 = 211.2, the number of heat units each square foot of radiation will have to emit per hour. By referring to text books on heating we find that 211.2 units of heat are emitted per hour by water at 185.1°, so that 31.6 square feet of radiation at a temperature of 185.1° should heat the air in this room to 70° (external air 10° above zero), which if it does is all that is required of the system, and is a guarantee that it will heat to the conditions on which the calculations for its installation were based. Although involving a great deal more calculations than Mr. Kinealy's method, still it may be of some use to your readers. The result as obtained by Mr. Kinealy's method, as shown in Table I is 182°, a difference of 3.1° between the two methods.

PROFITABLE TRIPS to Washington, D. C., are made by John I. Leitch, manager of the New York office, at 206 Centre street, of the Standard Radiator Company, Buffalo, N. Y. He spent a part of this week there talking radiation with satisfactory results.

HEATING NOTES.

AT 89 CENTRE STREET, the New York office of John A. Scollay, 74 Myrtle avenue, Brooklyn, a variety of Y's, T's, three way Y's and special fittings for greenhouse work are displayed. A neat rack supports pipe from 1¼ to 4 inch, showing the Scollay pipe joint, which can be used for the insertion of a new piece of pipe without the use of threads or couplings. Literature on the Scollay boiler for greenhouse heating is conspicuously displayed.

T. C. JOY & Co., Titusville, Pa., issue a notice to the trade that their new price list took effect February 1. They call attention to the fact that they have added to their already large assortment of radiators the Zenith, which they expect to be able to furnish by April 1. While advocating the flue type of radiator, they mention that those who desire the ordinary loop type can be supplied with the Orient loop apparatus.

THOMAS W. WEATHERED'S SONS are now comfortably settled at 141 Centre street, New York, displaying the Weathered hot water apparatus and greenhouse structural work. They have been delayed by the cold weather in the completion of the conservatory and heating plant for Senator Palmer at Larchmont. The changes made in the smaller sizes of their boilers in the fall have proven of advantage and popular with the trade.

PRESIDENT JOSEPH BOND of the American Radiator Company, Chicago, called at the New York office this week previous to embarking on the steamer "Teutonic" for Europe.

THOMAS E. CRONE Eastern manager of the American Boiler Company, at 94 Centre street, New York, was elected second vice-president of the company at the annual meeting, recently held at the main office in Chicago.

THE NIAGARA RADIATOR COMPANY, Buffalo, N. Y., are issuing a new radiator price-list the feature of which is the new goods mentioned. They are offering a new direct-indirect radiator and a new pin indirect radiator. They say that orders placed with them can be filled promptly and that their low radiators have proven very popular. The price-list can be had by those who have not received it, on application.

CLARENCE WOOLLEY, treasurer of the American Radiator Company, Chicago, is spending a few weeks in New York lending a helping hand at 92 Centre street. The Eastern headquarters has done a large trade during the last season.

THE HOLLAND RADIATOR & MFG. COMPANY, 69 Centre street, New York, are showing a new column radiator having alternate side connections between the loops instead of the usual straight through central connection. They have received from Blake & Williams, South Fifth avenue, New York, an order for 11,000 feet of this radiator. George Aspinwall is now visiting the trade in the interest of the company.

CHARLES ARMSTRONO, secretary of the Armstrong Mfg. Company, Bridgeport, Conn., has assumed entire management of the company's business of making pipe cutting and threading hand tools and machinery. H. E. French, the former manager, resigned the position and has been elected secretary of the Acme Shear Company of the same city and will superintend the manufacture of the Acme line of scissors, shears and tinners' snips and shears.

THE HERENDEEN MFG. COMPANY have removed their Western office from 131 Lake street, Chicago, to a large and commodious store at 52 Dearborn street, where their Western manager, A. G. King, expects to show a large line of Faultless Furman boilers, radiators and steam fitting supplies.

W. M. MACKAY, 211 Water street, New York, manager of the steam and hot water department of Hart & Crouse, Utica, N. Y., spent the week in New England in the interest of the line of Royal steam and hot water heaters.

GEORGE C. BLACKMORE of the United States Radiator Company, Saltsburg, Pa., will spend a few days among the trade in New York next week. He will have something new in a flue radiator to show.

W. F. COZZENS, St. Louis, has received a communication from T. M. Finney, for whom he installed a No. 56 Royal hot water apparatus, stating that he has satisfactorily heated 69,000 cubic feet of space when the mercury was from 11° to 17° below zero.

MAINS are to be laid in the streets of Terre Haute, Ind., by a company who will furnish steam for heating buildings. The exhaust steam from the electric light plant and street car company's boilers is to be used. The manner in which the pipes are protected from loss of heat and condensation of the steam is as follows: First there is a cast iron pipe of about 6 inches in diameter. This is covered with some kind of a patent wrapping and over all is drawn a hollowed pine log.

Southern Freight Rates.

The Louisville & Nashville Railroad Company have issued pig iron division tariff No. 36, taking effect February 1, giving rates on pig iron from Southern furnaces to points North and West. The rates to the more important points are given below:

To \ From	South Pittsburg, Tenn.	Chattanooga, Tenn.	Birmingham, Ala., District.	Sheffield, Florence, Decatur, Ala., Rockdale and Napier, Tenn.
Alliance, Ohio	$2.88	$2.95	$3.45	$3.20
Anderson, Ind	2.65	2.75	3.00	2.75
Atchison, Kan	4.39	4.50	4.50	4.05
Belleville, Ill	2.39	2 50	2.75	2.30
Buffalo, N. Y	3.43	3.50	4.00	3.75
Chicago, Ill	2.90	3.00	3 25	3.00
Cleveland, Ohio	2.88	2.95	3 45	3.20
Cincinnati, Ohio	1.67	1.75	2.25	2 00
Davenport, Iowa	3.30	3.40	3.65	3.40
Decatur, Ill	2.70	2.80	3.05	2 80
DeKalb, Ill	2.90	3.00	3.25	3.00
Denver, Col	9.08	9.19	9.19	8.74
Des Moines, Iowa	4.92	5.03	5 23	4.83
Detroit, Mich	2.92	3.00	3.50	3.25
Duluth, Minn	4.77	4.85	5.10	4.85
Evansville, Ind	1.88	2.00	2.25	2.00
Hamilton, Ont	4.03	4.10	4.60	4.35
Indianapolis, Ind	2.50	2.60	2 85	2.60
Johnstown, Pa	3.73	3.80	4.30	4.05
Joliet, Ill	2.90	3.00	3 25	3.00
Kansas City, Mo	4.39	4.50	4.50	4.05
Massillon, Ohio	2.88	2.95	3.45	3.20
Milwaukee (all rail)	3.35	3.45	3 70	3.45
Milwaukee (rail and water)	2 95	3.05	3.30	3.05
Niles, Ohio	2.98	3.05	3 55	3.30
Pittsburgh, Pa	3.43	3.50	4.00	3.75
Salt Lake City, Utah	16.85	16.96	16.96	16.51
Springfield, Ohio	2.23	2.30	2 80	2.55
Springfield, Ill	2.85	2 95	3 20	2.95
St. Joseph, Mo	4 39	4.50	4.50	4.05
St. Louis, Mo	2.50	2.60	2.75	2.30
St. Paul, Minn	4.60	4.70	4.95	4.70
Superior, Wis	4.77	4 85	5.10	4.85
Terre Haute, Ind	2.40	2.50	2.75	2.50
Youngstown, Ohio	2.98	3.05	3.55	3.30
Zanesville, Ohio	2.68	2.75	3 25	3.00

The rates apply to carloads of not less than 17½ tons.

HEATING AND PLUMBING.

NEW WORK AND CONTRACTS.

The Checkley House at Prout's Neck, Maine, is to be remodeled at an expense of $20,000 and to be supplied with a steam heating plant.

C. S. Eames, Bridgeport, Conn., has the contract for plumbing J. S. Nash's house at Seaside Park and remodeling the Atlantic Hotel, also the plumbing and heating of E. T. Kirkland's house in New London.

The new residence of A. J. Hoyt, Norwalk, Conn., is heated by hot water, the plant being put in by the Bridgeport Steam Heating Company. The plumbing was done by the Jones & Hotchkiss Company.

The New England Engineering Company, Waterbury, Conn., are to erect a five-story building that will be heated by hot water.

Fleming & Co., Brattleboro, Vt., have begun putting in the plumbing and steam heating apparatus at the new Holden & Martin factory.

E. W. Peck & Co, Birmingham, Conn., have secured the contract for placing a heating apparatus in the new residence of D. Bedient of Seymour.

At a meeting of the Court House Board of Toledo, Ohio, last week, it was decided to advertise for bids for heating the new Court House from plans which they approved.

William F. Comfort, Norristown, Pa., has secured the contract for plumbing and gas fitting in the house to be erected by School Director George B. Kite.

Robert Morgan, New Haven, Conn, has the contract for the plumbing in the Masonic Home at Wallingford.

The contract for heating and ventilating the Pullman Memorial Church at Albion, N. Y., was obtained by Hays & Falls, the well-known contractors at 290 State street, Rochester. The system of heating is that of indirect low pressure steam. There are two 20 horse-power horizontal steel tubular boilers, connected so that one or both may be used.

Charles Kostlevy, 218 West Eighteenth street, Chicago, has the contract for plumbing in the flat building of F. H. Linka, 974 South California avenue.

Davey & Schumacher, 454 Lincoln avenue, Chicago, have the contract for plumbing in the flat building of Charles A. Born, 401 Addison street.

Otto W. Herrmann, 419 West Fullerton street, Chicago, is to do the plumbing in the flat building of F. Sigman, 235 Linden street.

G. M. Hawtree & Co., 6822 South Halsted street, Chicago, are to do the plumbing in the residences of Mrs. C. F. Crosby and M. A. Frasser, 1509–1511 Dakin street.

E. B. Kaiser & Co., 161 Southport avenue, Chicago, have the contract for plumbing in the store and flat building of J. Bobel, Henderson and School streets.

Herzog & Killian, 2226 Archer avenue, have the contract for plumbing in the flat building of P. J. Busa, Forest avenue, near Thirty-sixth street.

James J. Evans, 4346 State street, Chicago, is to do the plumbing in the residence of K. Thielin, 4721 Atlantic street.

Arthur J. Keefe, Vincennes avenue, near South Halsted street, Chicago, is to do the plumbing in the residence of O. E. Hough, 8616 South Morgan street.

William C. Bletsch, 1216 Belmont avenue, Chicago, has the contract for plumbing in the flat building of B. J. Regnall, 644 North street.

The John F. Alles Plumbing Company, 233–235 Lincoln avenue, Chicago, have the contract for plumbing in the flat building of Charles A. Ashlerland, 1833 North Halsted street.

William S. Verity, 229 West Randolph street, Chicago, is to do the plumbing in the flat buildings of Samuel Brown, 120, 145–151 Cosgrove avenue.

Alwin W. Bahn, 393 Gross Park avenue, Chicago, is to do the plumbing in the residence of F. Ztemann, Roscoe boulevard and Northern Western avenue.

Kehm Bros. & Mertz, 289 Kinzie street, Chicago, are to install a steam heating plant in the factory building of Rueckheim Bros., Clinton and Harrison streets.

Daniel Gordon, 562 Forty-fifth street, Chicago, is to do the plumbing in the store building of W. E Spencer. 614 Sixty-third street.

J. H. Bradley, 8026 Vincennes avenue, Chicago, has the contract for plumbing in the flat building of J. D. Horton, 2704–2712 Deering street.

The plumbing contract for the Algonquin Hotel at St. Andrews has been awarded to William Donovan of St. Stephen, Maine.

The handsome residence which Captain P. A. Nickerson is building at Winchester, Mass., will be heated by an eight-section No. 320 Richmond steam boiler, which Edward E. Parker of Woburn will install.

The John W. Mills Company, 100 Lake street, Chicago, will place heating plants in the new residences of C. A. Hull, G. L. Heusner and Edward Davidson, all on the north side.

A. C. Hickey, 69 South Clinton street, Chicago, is overhauling the plumbing work and steam heating plant in the Chicago Athletic Club Building, Michigan avenue.

The Smith & Anthony Company, 219 Lake street, Chicago, are to place a Hub warm air heater in the residence of Charles H. Lawrence, Lake Forest, Ill.

Cook & Chick, 253–255 Kinzie street, Chicago, are to install a steam heating plant in the Lincoln National Bank, North Clark and Michigan streets.

The following plans for the construction of plumbing were filed at Inspector Bemis' office, Providence, R. I., during the week ending February 8, the names of owners being given first, the location next and plumbers last: City of Providence, corner Eddy and Henderson, Phillips & Phillips; P. Peckenham, 51 Lippitt, John S. Wright; Diamond Machine Company, Atwells avenue, R. Richardson; the Thomas Phillips Company, 91 South Main, the Thomas Phillips Company; Peter Simoni, 22 Brayton avenue, James A. Donnelly; Peter Peterson, 62 Glover, John T. McGann; Franklin P. Rand, Adelaide avenue, Charles R. Blackmar; American Brewing Company, Harris avenue and Eagle, D. Holmes & Co.; W. W. Ricker, Pacific avenue and Balcb, E. Frank Carey & Co.; George M. Baker, 83 Page, John J. Shanley.

E. Baggot, 139 Adams street, Chicago, has the contract for plumbing in the Edison Company Building.

Conlon & Montgomery, 33 Dearborn street, Chicago, have the contract for hot water heating in the residence of R. B. McMullen, Evanston, Ill.

M. L. Mandable, 258 Clark street, Chicago, is to do the plumbing, gas fitting and sewerage in the residence of F. Sherman, 547 North State street.

Repairs to the amount of $7500 are recommended to be made to the heating and plumbing systems in two Government buildings at St. Louis, Mo.

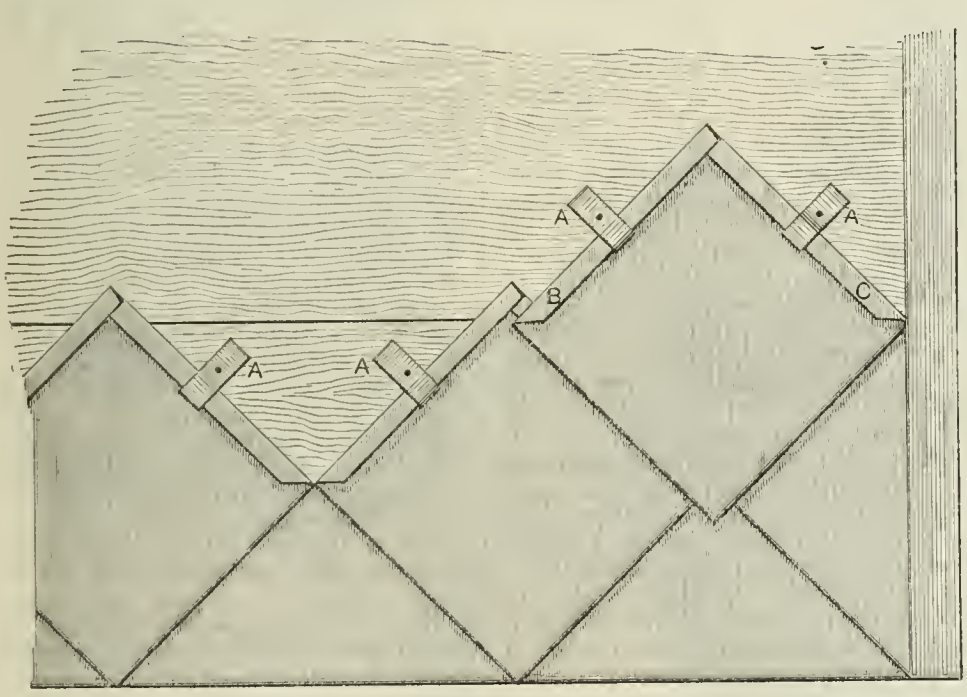
A. B. Franklin of Boston has secured the heating contract, and John F. Mulvey, Woonsocket, R. I., the plumbing contract for the new Court House at Woonsocket, R. I.

Bids for heating and ventilating the Court House at Toledo, Ohio, will be receiveduntil March 12; for the powerhouse tunnel and smoke stack until March 27.

The T. M. Lucey Plumbing Company, North Adams, Mass., are doing the plumbing and will put the heating apparatus in "Maplehurst," the summer residence of J. C. Newton at Wilmington, Vt. This company are also doing the plumbing in H. A. Adams' residence in Wilmington.

Sealed proposals will be received at the office of the Supervising Architect, Washington, D. C., until March 12, for a low pressure steam heating and ventilating apparatus, including power boiler, &c., for the United States Post Office, Custom House, &c., Building at Jacksonville, Fla. Drawings and specifications may be had from the office of the Supervising Architect, Washington, or from the Superintendent at Jacksonville, Fla.

Bohn Bros. & Kern, Zanesville, Ohio, have secured the contract for the plumbing, gas fixtures and steam heating of the Richards-Van Voorhis Block.



The Correspondence School of Technology, Brainard Block, Cleveland, Ohio, offers courses in applied electricity, steam engineering and transmission of power, surveying and roads, bridges, roofs and iron structures. The faculty of the school comprises a number of well-known engineers, covering all the branches alluded to. The school publishes a valuable little treatise entitled, "Hints to Engineers Operating Small Electric Light Plants," by E. P. Roberts and W. B. Stewart.

William C. Vosburgh, president of the W. C. Vosburgh Gas Fixture Mfg. Company of Brooklyn, N. Y., died of heart failure at his home, 229 Clermont avenue, Brooklyn on February 8, at the age of 68 years. Mr. Vosburgh was born at Hudson N. Y., and went into the gas fixture manufuacturing business in Brooklyn in 1865. He established the company that bore his name, and built up a large business. In 1885 he organized the Brooklyn Gas Fixture Company, from which he retired in 1892. Later he established the Vosburgh & Birkett Gas Fixture Company, with works on Jay street. Mr. Vosburgh was very prominent in Republican circles and also socially. He leaves a wife and one daughter.

ROOFING AND CORNICE.

Looney's Zinc Shingles.

We illustrate herewith the zinc shingles manufactured by Looney & Co., Nevada, Mo., who have applied for a patent on them. Comparatively little interest has been taken in this country in the application of zinc for roofing purposes, and this adaptation of the material is therefore particularly noteworthy. The shingles have been put to practical trial, and Messrs. Looney & Co. advise us that they laid 103 squares of them on the new Public School Building at Webb City, Mo., and five squares on the Webb City Milling Company's building, where they have been thoroughly tested with satisfactory results. The shingles at present are made from No. 12 zinc, and when laid are 12 inches square. The ordinary form of the shingle is square, as shown in the illustration, while for tower work the shingles are diamond shaped. The sheet metal is cut 14 inches square and the laps turned 1 inch each side, making, as above stated, the finished size of the shingle 1 square foot. In the accompanying engravings Fig. 1 is a section of roof with the shingles in place. A, A, A are cleats which hold them down, the end of the cleat being turned over the lock of the shingle. B and C, Fig. 1, show the upper lock. In Fig. 2 the view of a single shingle is presented, illustrating more clearly the locking arrangement. The upper locks B′ and C′ correspond with B and C in Fig. 1, while D and E are the flanges or locks on the bottom of the shingle, as shown by the dotted lines. The width of the flanges is 1 inch, and the shingles are laid with ⅛ inch play in the lock, so as to allow plenty of room for the contraction and expansion of the metal. The principal trouble, it will be remembered, with zinc has been its great variation at different temperatures. For this reason ample provision is made in the shingle illustrated. When laying the shingle on the roof the lock E, Fig. 2, will engage with lock B, Fig. 1. As each shingle is put in place it is fastened by the cleats A A. The manufacturers especially refer to the way the upper corner is folded, which, it is claimed, is done in such a way as to keep out all water that may be driven up under the shingles.

Looney's Zinc Shingles.—Fig. 1.—Showing a Section of Roof.

Slate Items.

A SLATE MILL in Bangor, Pa., is working on an order for 4000 feet of finished slate to be used as shelving in a public library at Chicago. It is the first known order of the kind.

THE SLATE SHIPMENTS from the Slatington, Pa., section during the week ending January 5, as reported in the *News*, were: 1768 squares roofing slate, 604 crates blackboards, 503 crates school slate, 6 bundles, 50 crates and 178 pieces flagging.

THE Great Bangor Slate Company of Bangor, Pa., have been incorporated with a capital stock of $25,000.

IN REFERRING to the slate industry in that region, the *Pen Argyl Index* says: "The slate shipments from all sources in the Pen Argyl section in December, 1894, were: 91 carloads roofing slate, 2 cars and 119 crates slate slabs, and 273 crates blackboards. The total shipments of slate products of all kinds for the Pen Argyl quarries in 1894 were: 1519 carloads and 71 boxes roofing slate, 33 carloads and 1013 crates mill stock, 2 cars and 2109 crates blackboards, and 1 car school slate. The volume of business done at the various slate quarries and factories in Pen Argyl during the year 1894 shows a slight increase over that of the year 1893, which is an indication that the business is slowly reviving and that we may soon look for a restoration to the prosperous condition of affairs of 1892—the banner year for the slate industry."

FLASHINGS.

THE EIGHTH ANNUAL CATALOGUE AND PRICE LIST just issued by Rhodes, Dickelman & Co. of Forest, Ohio, is an attractive publication of 84 pages, bound in paper covers of deep green, carrying an embossed side title in old gold. Since the last edition of their catalogue was issued the company have reorganized the business, enlarging their working capital, adding several new departments and making sundry improvements in old ones, thus placing them in a better position than ever before for supplying the demands of the trade. In the early pages of the publication reference is made to the fact that the company's double fold lock seam, Struble's cap seam, standing pressed seam and roll and cap roofings, except when otherwise specially ordered, are made of genuine steel and not of iron. This steel is made specially for the company, being rerolled, box annealed and free from scales. The painting is done upon the grain of the metal, hence the makers claim it will not crack or peel off. The metal is thoroughly inspected and all imperfect sheets thrown out, the utmost care being maintained throughout. The goods illustrated and described cover a varied assortment, and in addition to the lines above mentioned include cluster tiling or shingles, clap or weather boarding, siding, sheet steel pressed brick, beaded and corrugated iron, patent slip joint reversible eave trough hangers of various kinds, corrugated expanding conductor pipe, elbows, rain water cut offs, roof gutters, ornamental ridgings, crown moldings, finials, ventilators, metallic cresting blocks, roof paints, &c. An interesting feature of the volume is found in the rules of measurement in selling sheet metal building material, and also rules for measuring after the material is applied to the building. There are also given suggestions to be observed in ordering goods.

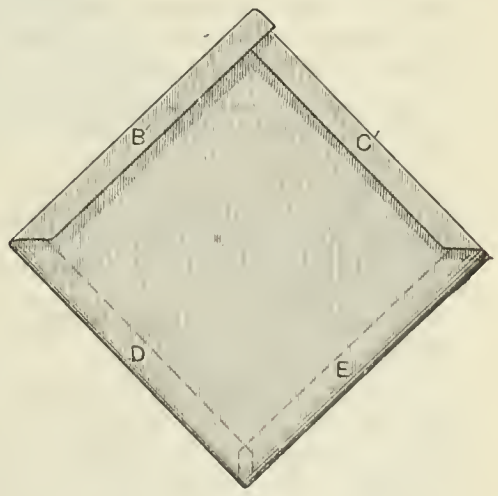


Fig. 2.—View of Shingle, Showing Locks.

GUMMEY, SPERING & Co., Philadelphia, in a recent communication, call attention to their special brand of "Waldo" hand dipped ternes. This is a brand which the firm introduced to the roofing trade over 15 years ago, and

it has, they state, gained a great reputation throughout the country. They are now making these plates at their own tin plate works in Philadelphia, and are keeping them up to the same high standard of quality. They are referred to as American plates in every particular, including the iron and the labor employed in coating them.

The John Siddons Company of Rochester, New York, are now laying the Spanish tile and doing the copper work on the valley and gutters of the handsome new depot of the New York Central Railroad at Syracuse, New York.

Wagner Bros., 1350 Diversey street, Chicago, Ill., have signed contracts for copper cornice and red slating for A. Waldman's residence on Diversey street, near Park avenue ; copper cornice and galvanized iron work on F. Sulling's three story flat and basement building, at 1715 Diversey street ; galvanized iron work for C. P. Steffenson's building, Gross Park avenue and School street.

The American Roofing Company, St. Louis, report a good trade, and state that their January business showed an increase of over 50 per cent. in comparison with the corresponding month of last year. They report the Texas and coast trade as being particularly heavy. The Cincinnati factory of this concern is also well supplied with orders.

Sanitary Security Company.

The Sanitary Security Company, with main offices in the Lincoln Building, 1 and 3 Union Square, New York, have been organized under the laws of the State of New York to provide for the sanitary inspection and guaranteeing of buildings in the interests of either landlords or tenants. Naturally the real efficiency of such a company will depend upon the intelligence and trustworthiness of those having its work in charge. It is of especial interest therefore to note the number of emlnent and well-known names comprised in the following list of officers and directors:

President, James C. Bayles, Ph.D., Past President Health Department, New York City.

Vice Presidents, George E. Waring, Jr., C. E., Commissioner of Street Cleaning, New York; Joseph H. Raymond, M. D., Past Health Commissioner, Brooklyn, N. Y.

Secretary and Attorney, Edward A. Sumner.

Treasurer, George R. Percy.

Technical Consulting Staff : Sanitary Engineers, George E. Waring, Jr.; Waring, Chapman & Farquar. Bacteriologist, T. M. Prudden, M. D., Chief Department of Pathology, College of Physicians and Surgeons, New York. Chemist, Charles F. Chandler, Ph.D , Past President Health Department, New York. Engineer of Heating and Ventilation, A. R. Wolff, M. E.

Of Counsel, Sullivan & Cromwell.

Directors: J. C. Bayles, George E. Waring, Jr., Richard S. Treacy, W. H. B. Totten, Hon. Darwin R. James, Jos. H. Raymond, M. D.; Edward A. Sumner, Fredk. M. Dean, Geo. R. Percy.

The company offer their services to owners of real estate and to tenants, and their claims are clearly set forth in the circulars they issue, the one addressed to the owners of real estate reading as follows:

The endless and vexatious contention between landlords and tenants over the sanitary appointments of leased buildings, involving questions which neither understand and concerning which it is difficult for either to obtain wise and disinterested advice, is the cause of much expense and annoyance to owners and of dissatisfaction to tenants. This contention is as unnecessary as it is undesirable. It is, moreover, expensive. As a rule the owner of real estate understands, or at least appreciates, his moral and legal responsibilities as a landlord and has no wish, by his negligence, to expose his tenant to risk of life or health. It is because he does not know, in most cases, how to discriminate between reasonable and unreasonable complaints, and has no convenient and trustworthy means of advising himself how to protect his own interests and serve those of his tenant at the same time, that necessary repairs and replacements are so often neglected and unnecessary expense so frequently incurred. If the landlord is complaisant and obliging he is apt to be imposed upon—if the reverse the tenant is likely to make him as much trouble as possible. Much of the apparent unreasonableness of tenants is due to the fact that they are unintelligently apprehensive of dangers from supposed sanitary defects and attribute every illness and indisposition in their families to "sewerage poisoning." If, however, the tenant knows that his landlord is doing all that is right and proper, under competent and disinterested professional advice, and that every complaint he makes is given prompt attention, he will, as the rule, be satisfied and feel perfectly safe. When the sanitary care of a rented building is assumed by the Sanitary Security Company of New York, the owner is relieved of all further annoyance from complaints by tenants. If complaints of the condition of his premises reach him he refers them to us. If repairs or replacements are necessary, they are recommended; if not, the owner may safely decline to make them. Tenants are often very careless, and sometimes maliciously destructive of rented property; and their persistent violations of the provisions of the sanitary code frequently entail much trouble and expense to the owners before reletting is possible. Tenants can be required to take much better care of rented premises than they often do, and owners will thus be saved a large part of the annual cost of maintenance of rented property. Owners suffer much annoyance and loss from the vacation of houses by tenants, who allege the unsanitary condition of the premises as an excuse. This company will not guarantee rents, but in the case of buildings under their care they will, at their own cost, prosecute the owner's suit against a tenant vacating for this cause, and if they cannot get judgment against the tenant, will indemnify the owner for any loss he may suffer in consequence of such vacation. If the owner has put his building in a condition satisfactory to this company, and we become responsible for it, we will either vindicate him by getting judgment against the tenant, or we will indemnify him for loss of rent. The Sanitary Security Company of New York desire that the value of the service they offer to owners of property shall be judged solely by the standard of economy. We can save the owner of real estate many times the cost of employing us, and we can materially assist him in securing, satisfying and retaining desirable tenants for desirable buildings.

The services they offer to occupants of rented buildings are explained as follows:

The worst conditions encountered in sanitary inspection are found in rented buildings. However well built originally, they are almost always found to have deteriorated during successive occupations until, from frequent patching and general neglect, they reach a condition which is a constant menace to life and health. If it were our purpose to create a popular panic the record of facts resulting from the sanitary inspection of rented dwellings, apartment houses, hotels and business buildings in and near New York would furnish ample material. As the rule, dwellings and places of business are hired with little or no inquiry as to their sanitary condition. If any questions sre asked the answers cannot be expected to give information of value. The most dangerous defects in the sanitary condition of a building are not those likely to attract notice. What the tenant knows of the sanitary condition of a building he usually learns from experience after he has moved in, and this knowledge is sometimes gained at very serious cost. The Sanitary Security Company place at the command of tenants of all classes of buildings the means of guarding against original mistakes in selecting unsafe dwellings or places of business, and against such dangers as may result from the negligence of landlords in keeping their property in repair as to sanitary appointments. As the rule, we prefer relations with owners, as under such relations all interests are best served; but in many cases the tenant is forced to adopt measures of self protection against the negligence of the owner or his representative. When such conditions are found to exist we will undertake the protection of the tenant by all legal and proper means. Under a contract with a tenant, we first make a thorough sanitary survey and inspection of the building he occupies. When conditions are found which involve danger to life and health, we undertake to move promptly in his interest and to exhaust all means for having such conditions remedied. We will hold the owner as closely to his responsibilities as the law permits, and will do all that can be done to protect the tenant. If at any time the premises are found in such condition that, in the judgment of our experts, they are unsafe for occupation, we will advise the tenant to move out; and if on our advice he follows this course, the Sanitary Security Company will defend any suit brought against him for rent after such vacation, and pay whatever the landlord may recover judgment for—provided, of course, such judgment shall not be for rent during the tenant's occupation. Our responsibility in the matter of rent does not begin until the tenant has vacated unsafe premises by our advice. We further undertake to protect our tenant clients, so far as practicable, against injury from remediable external nuisances. Under a contract with a tenant we will make four thorough inspections of his premises each year, and as many special inspections as may be warranted by the information he furnishes. So long as his house is under our care he may be sure that everything practicable is being done for his protection.

THE RETAIL STORE.

Empire Spraying Pumps.

Field Force Pump Company, Lockport, N. Y., are offering the spraying pumps shown in the accompanying

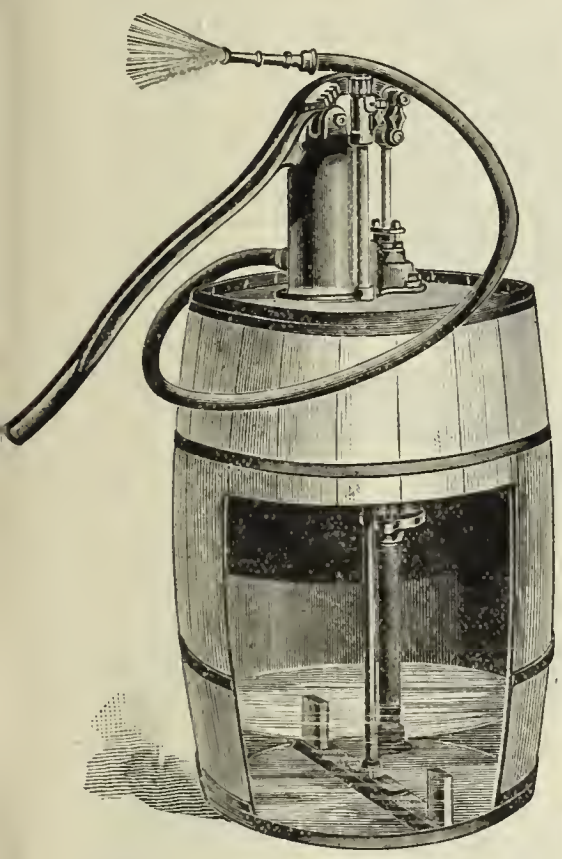

Fig. 1.—Empire Queen Spraying Pump.

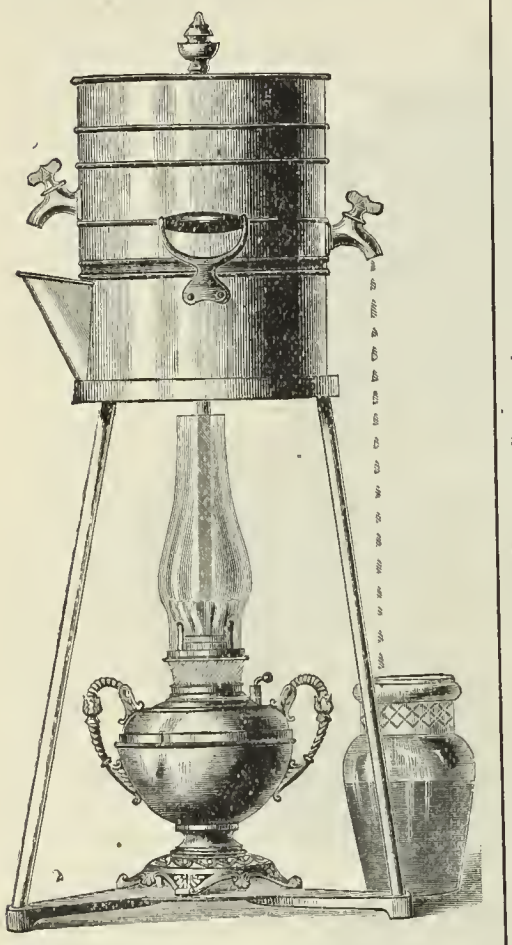
cuts. The Queen pump, Fig. 1, has a seamless brass cylinder, with brass plunger snd brass rod; also a brass

Fig. 2.—Empire King Spraying Pump.

screw spout, to which the hcse is attached by a screw coupling. It is explained that the pump has a large air chamber, by means of which the spray is strong and continuous; also that 5 feet of hose and the company's graduated nczzle are furnished with the pump. It is further explained that the agitator works in connection with cogs from the lever, connecting with a companion gear at the upper end of a steel shaft, at the lower end of which is a horizontal wooden bar. Thus when the lever is moved upward or downward the agitator bar travels, it is stated, in a semicircle in the bottom of the barrel, and prevents the poison from settling. The pump is furnished with a suction pipe, which is provlded with a fine brass strainer at the lower end, to effectually prevent leaves or dirt from gettlng into the pump or nozzle. The manufacturers claim that the pump works easily, and it is guranteed in every respect. The King pump, Fig. 2, is similar to the Queen, but larger. It has two Eureka spraying nozzles, with which two rows of trees or vlnes may be sprayed at the same time. The seamless brass cylinder is 8 inches long, having brass plunger snd rod, and brass screw spout with a stop cock. It also has two 10-foot sections of heavy hose furnished wlth couplings which can be joined, making one continuous hose 20 feet in length. The pump is provided with the same kind of mechanical agltator as the Queen, a large air chamber and a tight cap for closing up either opening of the spout when but one nozzle is used. It is stated that the suction pipe is of galvanlzed iron, with a brass strainer, and that the pump has a long lever.

Rochester Mammoth Fount.

The Rochester Lamp Company, 42 Park place, New York, have brought out the New Rochester mammoth fount, as here shown. It embodies some of the essential features of the New Rochester table lamp, fully illustrated and described in these columns November 29 last. It has a thumb-screw wick lift, which can be operated from either the top or under side of the fount. The wick is lifted with a rotary



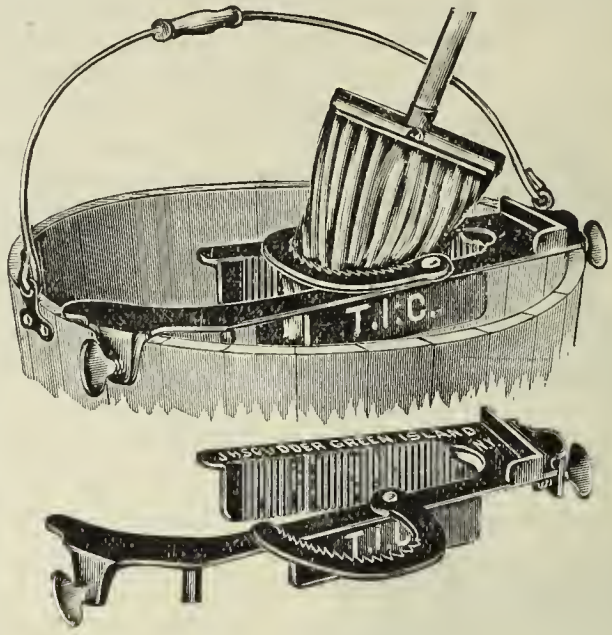
No. 10 Rochester Mammoth Fount.

movement by means of a toothed wheel fixed rigidly to the center of the rcd connecting the two circular thumb screws, giving a gradual and positive motion in raising or lowering. The teeth of the wheel engage a perforated wick lift. In lighting, the frame holding the chimney can be ralsed by operating the lever seen at the right, without removing the chimney. A larger inlet for oil is another advantage over the fount formerly made. The gallery (or top part) is screwed in, and by carrying the perforated metal up close around the wick tube there is now no dirt pocket and no chance for odors from refuse and wlck cllppings. The New Rochester double over cone is used, whlch gives a double clrcular flame and, it is said, a llght equal to 400 candle power. A perforated wick lift is used, whereby the draw bar, with sleeve and wlck, can be taken entlrely out of the lamp. The fount ls furnished in brass or nickel, ls 10¼ inches high from bottom to top of burner, holds a full gallon of oil, and wlll burn,

it is said, 10 to 12 hours. This fount is designed largely for stores, offices, churches, &c., where large volume of light is demanded. They can be hung in harps or swung in brackets.

Browne's Water Still.

A device for the convenient distillation of water for drinking purposes is that shown in the accompanying illustration. It is being manufactured by F. E. Browne of 314–316 South Spring street, Los Angeles, Cal. As shown in the engraving, the device consists of a stand, supporting an ordinary oil lamp, above which is the metal still. The latter consists of a boiler, having a conical cover around which projects a rim, forming a reservoir, which holds a supply of water to cool the cover and cause the steam which rises from the water

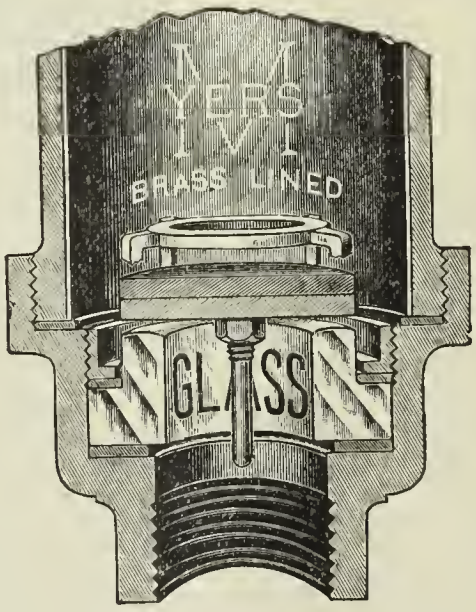


Browne's Water Still.

within the boiler to condense on the under side of the cover. By an ingenious arrangement the condensed water is collected and discharged through a faucet into a suitable vessel, as shown in the engraving. In its fall through the air the water is said to become thorougly oxygenated. The still complete is 12 inches high, 9 inches in diameter and weighs 5 pounds. It is made of copper, tinned on the inside and nickel plated on the outside. The manufacturer guarantees this device to distil 1 gallon of water in three hours, and states that greater rapidity would prevent a thorough oxygenation of the water. The stand supporting the still and lamp consists of a tripod, with the lamp support arranged to slide up and down the legs and to be secured at any hight so as to accommodate a short or tall lamp at a sufficient distance from the bottom of the still in order to secure the best results. Both the still and lamp attachment are portable and may be readily taken apart or put together. Mr. Browne refers to this device as a practical, ornamental still, which is effective in use, reasonable in price and can be used upon any kind of stove, or in connection with the lamp which furnishes the light for evening work or pleasure, thus giving, without additional expense, a supply of pure water for the next day's use.

The T. I. C. Mop Wringer.

The illustration herewith shows the T. I. C. mop wringer recently put on the market by the Torrance Iron Company,



The T. I. C. Mop Wringer.

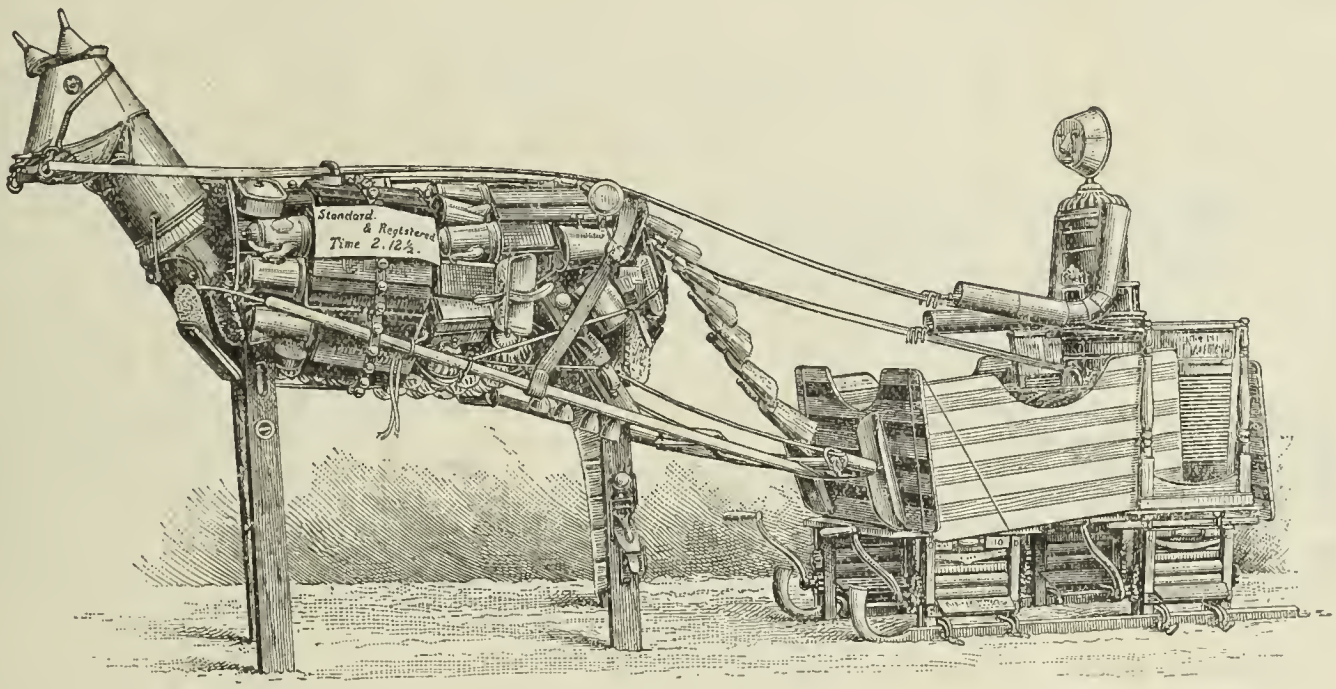
Troy, N. Y. It is a malleable casting that is adapted for securing to a pail by set screws. In use the mop is placed in the slot and the swinging piece swung around it. Then, by twisting the mop to the right and upward, the water is effectually wrung out of it. During the operation the pail and wringer are held by placing the foot of the user on the slot plate.

The Myers Improved Drop Valve.

F. E. Myers & Bro., Ashland, Ohio, are using the drop valve in connection with the glass valve seat in their pumps, as shown herewith. The glass

The Myers Improved Drop Valve.

seat is underlaid with a rubber gasket and is held firmly in place by a brass follower, drawn up tight, thus holding the glass seat in a reliable manner. The point is made that the valve seat is independent of anything else, and that it cannot be effected by the swinging of the suction pipe, or become disarranged in taking the pump or cylinder apart. The manufacturers call attention to the fact that the glass valve seat is noncorrosive and is smoother and more perfect than a metallic seat; that it is extremely hard and does not throw off corrosives, and that the leather operating on the glass retains its softness. The company continue to make the glass valve seat in connection with the older form of leather pump valve, hinged at the side, as is generally used by pump manufacturers with a metal valve seat.



New Enameled Ware.

Maurice Stransky of Stransky & Co., 27 Murray and 31 Warren streets, New York, returned to this city last week, arriving by the "Paris" February 2 from a six weeks' business trip to the Continent. This concern import largely Steel Enameled Ware for house furnishing, kitchen and culinary use. In his opinion the continued reduction in the price of this class of merchandise, necessitating a corresponding deterioration in quality, has been followed by a reaction among many buyers in favor of a higher standard of excellence at some increase in cost. With this in mind he has brought back with him a series of nine samples for dealers' and salesmen's purposes, resembling in shape miniature wash basins, all 5 inches in diameter. These are merely to show the various new colors and combinations in this grade of ware. Among those to which he alludes as strictly new are solid Turquoise Blue, Starry Turquoise Blue and a solid Ivory or Elephant Tusk color. The interiors are all solid white. The remaining varieties will be known in the trade as Garnet and White, Cameo and White, Mosaic and White, Inlaid and White and Blue and White for the outside, the inside being solid white. Those to which reference has been made are said to have four separate coats of thin enamel, fired after each application, the fourth coating being the white interior. The ninth variety is a cameo finish over all alike, inside and out. A full line of American shapes can be furnished, including such staple articles as lipped Sauce Pans, Preserving Kettles, Tea and Coffee Pots, Tea Kettles, Wash Basins, Dish Pans and Water Pails, together with all the various smaller articles that constitute a full line. It is his intention to give the

sale of these goods to but one dealer in a town, to provide against ruinous competition, hoping thus to insure a fair profit to all concerned. Only importation orders will be taken, no stock being carried in New York except the last mentioned finish, viz., Cameo inside and out. To those interested a set of the nine samples will be sent from which to make up importation orders, which may be all of one kind or some of each variety.

A Unique Window Display.

Barrett Hardware Company of Joliet, Ill., have shown much ingenuity in arranging the horse and sleigh here illustrated, as a display for their large double show window. The floor of the window is covered with material to represent snow, producing the effect of a winter scene. The body of the horse is made by building a frame of wood about the shape of a horse, putting barrel hoops around it, and then covering it with various Hardware and House Furnishing articles. The head is made of a Funnel Coal Hod, with Oven Door Rosettes for eyes and inverted Funnels for ears. A Pudding Mold forms the lower part of the mouth, and a pair of Scissors and two Hanging Lamp Hooks comprise the Bit. The neck is a Flour Bin, and the body is covered with Tea Pots, Dinner Pails, Sweepers, Crumb Brushes and Pans, Tin Gem Pans and such other articles as will cover the frame. A pair of Potts' Sad Irons were used as terrets for the lines to pass through, the lines being of 1-inch Hoop Iron. For legs Levels and Planes are used, these being lined on the inside with Scrub and White Wash Brushes. The tail is formed of Brush Brooms wired together. The sleigh runners are two Plow Handles, with four Clothes Wringers for standards. An inverted Sewing Table and Lap Boards form the sides, front and back, and Molding Boards are used for the bottom of the sleigh. On the seat an Oil Heater is placed, with a Pan with Tinners' Trimmings soldered to the bottom to represent the face. Conductor Pipe and Elbows form the arms, and Garden Hooks are used for the hands. Two Drain Cleaners are used for thills and a Shovel forms the cross bar, with Ropes for tugs. The company suggest the use of Hoop Iron in place of Rope for the tugs, as they think it would produce a better effect.

A Unique Window Display.

MEMORANDA.

Cobb & Archer, 96 Centre street, have the New York agency for the Syracuse bicycle made by the Syracuse Cycle Company, Syracuse, N. Y. They have secured Gus. T. Berglund, a well-known trainer, as a salesman and look forward to a good trade. Scorching being one of the pastimes of the cycler Mr. Cobb's experience in his other business of steam and hot water heating should enable him to give to his customers some points in making even wheels circulate.

The Ochsner & Orcutt Company, 1012 Fourth street, Sioux City, Iowa, have purchased the business and sporting goods stock of C. E. Ellis of that place, and will add this to their line of general hardware. It is their intention to also do a jobbing business in relay bicycles and specialties. We understand that they propose making their facilities for gun and bicycle repairing second to none in that section, and will solicit work in that line throughout that territory. The company are agents for the Stewart stoves and ranges as well as for the other goods made by the Fuller-Warren Company.

The Scollay Plant Sprinkler, made by John A. Scollay, 74 Myrtle avenue, Brooklyn, and 89 Centre street, New York, for sprinkling plants and flowers, has been pronounced excellent for sprinkling clothes in laundry work. Illustrated circulars can be secured on application.

The firm of Behner & Norton, 530 Main street, Hartford, Conn., have been dissolved, the business to be continued by F. E. Behner at the old stand.

The G. L. Van Namee Mfg. Company, Gouverneur, N. Y., have brought out the Little Giant Steel Truck, for which they claim a number of special advantages. It is simple in construction, made entirely of metal and is designed with a view to possessing great strength. It is furthermore very light, weighing but 14 pounds. The wheels are made with wide tires with carefully fitted bearings. There is a patent adjustable clamp that is said to be a sure and positive grip on a barrel, and can be adjusted to any size of barrel. The finish of the truck is black japan.

Edward Miller & Co., Lamp manufacturers, now have the main entrance to their store at 66 Park place, instead of at 10 and 12 College place, New York, as heretofore. Owing to the widening of College place from Chambers street to Dey street, the buildings on the west side are rapidly being razed to the ground or parts of the fronts being torn down, as the case may be. As only a portion of their present stand has been demolished, as soon as a new front can be built conforming to the changed conditions their entrance will be as before.

The Ohio knock down stove pipe which the Geauga Foundry & Mfg. Company, Painesville, Ohio, are offering is put together by slipping a small metallic cylinder nearly the length of a joint of pipe over the locks, which are turned outward. The manufacturers state that a number of joints of the pipe put together will make a continuous line 46 feet long, if desired, of perfectly firm, smoke tight pipe that will not collapse. The pipe is in ½-inch sizes from 4 to 7 inches and is shipped in crates of 25 joints.

For some time past the Bakers' Unions of New York and Brooklyn have been striving to obtain remedial State legislation to obviate the unsanitary condition of many of the bake shops in these cities. In his official report to the Legislature, State Factory Inspector Connelly, speaking of this evil, says: "Hundreds of the small bake houses are located in damp cellars, where refuse, vermin and foul odors abound. It is stated that the proprietors and workmen in these places have become, perhaps from association, personally as unclean as the quarters they occupy. Many of the shops are used as sleeping rooms by the employees. Vile sanitary conditions and an all pervading disregard of the rules of health and decency are charged against these places, and there is a demand made that they be put under the supervision of the Factory Inspectors, and that stringent regulations be passed concerning them."

TIN PLATES.

Distribution of Tin Plate Imports.

From the British Board of Trade returns we print a table giving the number of boxes of tin and terne plates shipped to various ports of the United States from the port of Liverpool during the last ten years, from 1885 to 1894. These figures do not, of course, include all the exports of British tin plates to this country, large quantities being shipped from Swansea, Bristol and other English ports. But they are instructive as giving an idea of the proportionate distribution of imported plates in the various sections of this country, the plates being generally consigned to the port nearest to the place of consumption. The last column gives the total number of boxes of tin plates shipped to the United States in the same years.

Exports of Tin Plates from Liverpool to United States Ports.

Year.	Philadelphia.	New York.	Boston.	Baltimore.	San Francisco.	New Orleans.	Portland, Maine.	Portland, Ore.	Astoria.	Other ports.	Totals from Liverpool.	Total shipped to U. S. from all English ports.

Tin Plate in Wales and the United States.

Under the above heading the London *Engineer*, one of the most eminent and reliable technical authorities in England, publishes, in its issue of February 1, the following interesting editorial in regard to the present situation in the Welsh and American tin plate industries:

A noteworthy policy is now being advocated in Wales. Nothing less, in short, than a short life and a merry one for the tin plate trade. Certain manufacturers, and very many of the men, have arrived at the conclusion that the United States are going to make in the near future for themselves all the tin plate they need; that is to say, 75 per cent. of the total output of the 531 mills in the principality. That as a result the Welsh tin plate trade will become extinct, and that under the circumstances the best course to pursue is to raise the price of tin plate 5 or 6 shillings a box, to make in this way a great profit and carry away a legacy left by the dying industry. The idea involved appears to be absurd. It could only, we imagine, originate in the minds of Welshmen. Englishmen would scarcely give up the struggle in a fashion which it is not easy to regard without contempt. Yet the surprising character of the proposition startles us into the doubt that there is something behind it and that those who put it forward are in no sense cowards, but men wise in their generation and resolved to make the best of a bad case. We have taken some trouble to arrive at a knowledge of the facts. The situation is too complex to be dealt with within the limits of a single article. For the present we can do little more than direct attention to its salient features. We may add here at once, however, that we see no reason to regard the policy advocated as anything but suicidal.

Previous to the year 1665 England was exclusively supplied with German tin plates imported from Hamburg. In 1691 a patent was granted in this country for the manufacture of tin plate, and for about 200 years Wales has had a monopoly of the trade, which has grown from a make of 1,000,437 boxes in 1862 to 8,967,580 boxes in 1891. Fostered by the tariff and other causes, the United States began to make tin plates several years ago. Their earlier efforts in this direction failed; but Americans, unlike Welshmen, do not easily accept defeat. In the fiscal year 1892 there were made in the United States 13,646,719 pounds of tin plate; in 1893 the output rose to 99,819,202 pounds, and last year it reached 141,386,508 pounds, or 63,118 tons. It was believed that the abrogation of the McKinley tariff would shut up the United States mills; instead it brought about a demand for a reduction in wages. The American rollers had been earning on an average from $8 to $12, or 32 shillings and 6 pence to 48 shillings and 9 pence per day. The masters proposed $6 or 25 shillings per day. There was a strike, which has closed the American mills for the last three months. The accounts which have reached this country as to the magnitude and importance of this strike are conflicting. In the end the masters appear to have been victorious so far that a couple of weeks since a compromise was effected at a reduction of 15 per cent. instead of the 30 per cent. asked for, and we now hear that fears are being expressed that the output of American mills will be so great that the market will be glutted. Energetic as we know that our rivals across the water are, we venture to think that the fear is the outcome of hope rather than certainty. The situation in the States at present is this. The price of steel tin bar is about the same in the States as it is here. The cost of rolling the bar is greater than it is here; the existing tariff is just sufficient to represent the difference, and place the American manufacturer on the same level as the Welshman. The wages paid to tin plate rollers are high because these men are scarce. But for all the other processes the American manufacturer has learned to dispense by the aid of machinery with high class skilled labor. The following quotation from a letter from an American firm will serve to throw more light on the subject than anything we could write: "It is all nonsense about coal miners, laborers, grocery clerks, &c., being easily trained into the position of rollers, sheeters, doublers, &c. Of course, there is not the union nonsense about it over here that there is in England, but still at the same time it does require skilled labor to roll sheets, as you can spoil more iron, break more rolls, and lose more money in shearings if you have a poor rollerman than any low wages could make up for. It is no easier to roll iron in America than it is in England. We have found that as far as training is concerned we can train a grocery clerk or a boy to run a tinning pot in a few days as well as any full grown Welshman." Furthermore, letters which lie before us show that so far from the American makers finding it necessary to import Welshmen, they are very desirous to get rid of the few that they have, pronouncing them obstinate and slow. Thus, then, it may be stated that the United States are very nearly in as good a position to make tin plates as Wales, the difference in wages being represented by the tariffs and freights. But it must be very clearly understood that this—from an American point of view—favorable state of affairs is due entirely, or nearly so, to the low price of bars. Quoting from another letter, we have the following: "All calculations regarding the ability of the Americans to make tin plates have been overturned by the heavy drop in the prices of billets and bars." And again, "The whole situation is narrowed down to whether the protection given under the new tariff bill of $1.20 on tin plate and $1.22½ on black plate, is or is not enough to protect the Americans in rolling the billet down to the sheet, because that is the only part of the operation that needs protection."

No doubt Wales will have to take account with American competition. The monopoly in tin plate will go the road that England's monopoly in steam engines and cotton went, many years ago. But it is folly to assume that because the monopoly is gone the trade must go too. It is admitted on all hands that the price of iron in the United States is abnormally low. A moderate rise would tell heavily against the American plate mills. But, again, the wages in the States are very heavy, so far as skilled labor is concerned, as we have shown. The Welsh tin plate workers have had to submit to a reduction of 12½ per cent. This may seem a great deal. It is well that what it means should be properly

understood. In ordinary times the roller men earn about £3 per week, or nearly twice as much as a fitter. The work is not exceptionally heavy; nothing like so severe as that of a puddler, for example. In 1874 the high water mark of wages was reached. The trade was never so prosperous. It will scarcely be credited that until last year no change was made, or attempted to be made, in the scale. But, besides this, the unions restrict the make to 36 boxes per mill per shift of eight hours. The result is, that all the standing charges per box are much increased. In the United States the out turn is 50 to 55 boxes in eight hours.

Obviously, it appears to us, the proper position for masters and men in Wales to pursue consists in combining together to defeat the American maker. One of the first things to be done is to steady the market and give the dealers and brokers some chance of doing trade on a sound basis. There is a very well grounded complaint that an exporter now is never sure that the price he pays is the lowest at which he could have bought. "The higgling of the market" is a recognized factor in political economy, but it can be carried to such an extent as to check trade. In the next place, the whole position should be reconsidered—not on a small scale or in a narrow minded way, but very broadly; and a definite figure should be arrived at as representing the price at which plates can be made, leaving a fair but not excessive profit, and that price should be such as to kill American competition if possible, even if it did not represent any profit at all. The representatives of the men should meet the masters, and by discussion arrive at a definite conclusion. The question for consideration is terribly simple. Is the manufacture of tin plate in Wales to be abandoned or continued? To answer this it is essential that the true nature of the United States competition should be known by master and men alike. If it is determined that it is to be abandoned by the existing owners, we may rest assured that others, younger and more enterprising, will take it up and continue it—probably on a smaller scale and under different conditions as to wages and machinery; or a great union of the more powerful mills may be formed to beat the American manufacturer. If, on the contrary, it is resolved that the American shall be fought on the existing lines, then it is for masters and men to combine with that object. As for the union, there appears to be but one course open—it must submit to a reduction in wages and a removal of restrictions which, barely tolerable under a monopoly, are out of the question in a trade fighting for existence. The only certainty at present is that the manufacture of tin plates in the United States is in a fair way to become a great industry, and nothing short of a considerable rise in the price of iron appears to be likely to check it.

The Tin Plate Crisis in Wales.

According to the latest news from England matters in the tin plate trade in South Wales seem to have reached a grave crisis. One-half the works are wholly idle and the rest are only working fitfully. Intense distress naturally exists among the workmen and their families in the tin plate districts owing to the prolonged idleness of so many of the works. The severity of the weather of late has added acutely to their sufferings. Private intelligence received from that quarter describes the hardships endured by the poorer families in the South Wales tin plate districts as being almost unheard of in prosperous Wales. They are in many cases absolutely without the necessaries of life and are starving of hunger and cold. This condition of things involves several thousand men, women and children. As to the outlook no one cares to express any opinion.

Yet, notwithstanding all this, the men's delegates seem determined to prefer complete idleness to the 20 per cent. reduction in their old wages demanded by the manufacturers. Many of the latter express themselves as being willing to resume if this concession and the abolition of the 36 box rule are granted, even if they are only able to make their expenses. Failing this, they explain that they cannot afford to go on making tin plates at a loss and their only alternative is to shut down, which in most instances they have proceeded to do. Nor can they be blamed for their action. With a dwindling trade and prices declining week by week, until the figures touched last week are said, on good authority, to leave the makers with a loss of 15 per cent., it is an utter impossibility for the manufacturers to keep their works running at the old scale of expense. The situation seems to justify the English journals in describing it as the worst ever experienced in the entire history of the tin plate trade.

SCRAP.

J. S TREGONING, proprietor of the well known Morfa Tin Plate Works, Llanelly, South Wales, appears to take a very disheartened view of the prospects for the Welsh tin plate industry. In a recent speech, delivered to his workmen, Mr. Tregoning is reported to have said, speaking of the future of the works, that what they proposed doing was to take stock very carefully and see what had been the result of the trading operations of the past six months. Upon that they would decide whether to continue or close the works. But in the mean time everybody would be paid off. As it was at present they could not carry on the business. It was a mistake on the part of the men to set their faces against improvements, and he believed that unless washmen were disestablished there was a very serious outlook before them. He had an opportunity the other day of selling the Morfa Works to a company, but he did not consider it honest so long as he could not see his way through the difficulty to throw that difficulty upon a company. Even if they had a reduction of 50 per cent. they could not make the works pay.

THE ERECTION of the National Tin Plate Works plant, Anderson, Ind., is being pushed. The main building, 400 feet long, is up, and the engine room is also erected. The works are expected to be in operation by May 1.

THE PROJECTED large tin plate plant to be erected at Washington, Pa., to which references were made in these columns some months ago, appears to be still in abeyance. Plans have been drawn out and the location decided on, but no active steps have as yet been taken toward the erection of the buildings. We understand, however, that the scheme has not been abandoned.

THE WELSH TIN PLATE TRADE, according to a well-known Llanelly manufacturer, quoted in the *Western Mail* of Cardiff, has never been in such a depressed state as at the present time. The Llanelly tin plate makers are only working off present orders, after which they will close their works and wait for an improvement.

HAMILTON, OHIO, will, it is said, soon have a large tin plate works. A company for the purpose is reported to have been organized, and the necessary buildings are to be erected shortly.

THE LOCATION of a new tin plate works at Frankton, Ind., by Cincinnati and Chicago capitalists, is reported to have been decided on. Work on the buildings will be commenced as soon as the weather permits. According to the terms by which a bonus is granted to the company, the plant must be in operation by July 1, working with not less than 350 hands.

FOLLANSBEE BROTHERS' COMPANY, Pittsburgh, Pa., manufacturers of Scott's Extra Coated roofing plates, who have succeeded to the business of James B. Scott & Co., are sole factors for the Blairsville Rolling Mill Company, Blairsville, Pa., manufacturers of tin and terne plate and black sheets. Messrs. Follansbee were for many years the active members of the firm of James B. Scott & Co., and their many friends in the trade will be pleased to know that the new house is meeting with excellent success and their business promises to greatly exceed that of the old firm.

AT THE CLOSE of this week almost all the tin plate works in the United States are in operation.

THE MORTON TIN PLATE COMPANY, Cambridge, Ohio, have placed an order for two five-roll Morewood tinning sets with the Lloyd Booth Company, Youngstown, Ohio.

IT IS STATED upon good authority that the addition to be made to the New Castle, Pa., Steel & Tin Plate Mill will be at least eight mills and perhaps ten, and that when completed the mill will be one of the largest and best equipped tin plate works in the world. A complete system of electrical cranes will be put in.

THE LIMITED PARTNERSHIP heretofore known as Wallace, Banfield & Co., Limited, Pittsburgh, Pa., operating the Irondale Rolling Mills, Irondale, Ohio, and manufacturers of tin and terne plate, has been dissolved. John C. Wallace, Wm. Banfield and W. E. Foale being appointed liquidating trustees. The business heretofore conducted by said partnership will in future be conducted by the above named parties, under the firm name of Wallace, Banfield & Co.

THE AMALGAMATED ASSOCIATION compromise scale has been accepted by the Ellwood Tin Plate Company, Ellwood City, Pa., and the plant of that concern is in full operation. At the present time there are but three concerns in the country manufacturing tin and terne plate that are not running under the above scale. These are: Wallace, Banfield & Co., Irondale, Ohio; U. S. Iron & Tin Plate Mfg. Company, Demmler, Pa., and St. Louis Stamping Company, St. Louis, Mo. The plants of these three concerns are in operation on the scale originally presented by the manufacturers, which called for a reduction of 30 per cent. in wages of rollers and 25 per cent. for heating and doubling.

AN EXPERIMENTAL RUN was made last week at the new tin plate plant of the Monongahela Tin Plate Company,

at Pittsburgh. This plant is located on the site of the old plate mill of the Oliver Iron and Steel Company, and contains nine hot and cold mills. For the present the concern will roll only black plates, while the tinning will be done by the Duquesne Tin Plate Company of Pittsburgh.

The Blairsville Rolling Mill & Tin Plate Company, manufacturers of tin and terne plate and black sheets, have made an arrangement with their employees by which Amalgamated Association scale prices will be paid, but the scale will not be signed. The plant of the above concern is in full operation.

William H. Griffiths, Pittsburgh, Pa., has secured a patent on a process of manufacturing tin plates, which consists in dipping the plate in a bath of molten metal through a layer of sand mixed with oil, and a chemical flux consisting of sal ammoniac and nitrate of zinc. Also in dipping them a second time through a layer of sand mixed with oil or tallow floating on the metal.

The summary statement of imports and exports for the month of December, 1894, prepared by the Bureau of Statistics of the Treasury Department, shows that only 28,313,364 pounds of imported tin and terne plates were lying in the bonded warehouses of the United States on the last day of the year, as compared with 46,725,926 pounds similarly held on December 31, 1893.

The British Board of Trade Returns for January show a great falling off in exports of tin and terne plates from British ports during that month, as compared with the previous month. They were 29,000 tons, against 38,000 tons in December, and 31,000 tons in January, 1894. Exports to the United States in January, 1895, were 18,000 tons, as compared with 24,000 tons in December

Prevention of Smoke in Cities.

The citizens of Chicago have on sundry occasions supposed that the problem of preventing smoke had been solved for them. But they have just as frequently been disappointed. Yet they have not abandoned all hope of correcting this vexatious accompaniment of the general use of bituminous coal. Probably no other city is so persistently keeping up the fight. The city ordinance imposing a fine for smoky chimneys becomes a dead letter after one set of officials has tried to enforce it and failed, but when a new set comes into power the issue is revived and the fight is hotly renewed. The administration now in power has been more persistent than its predecessors. Violators of the ordinance have been prosecuted with greater vigor than before, and those who have been obliged to pay heavy fines have turned to the use of anthracite coal to avoid further trouble. The soft coal interests of the city and State are important and were supposed to be all-powerful, but they have been wholly unsuccessful in attempting to induce or compel the present city authorities to cease their warfare on smoky chimneys. The result is that new lines are now being laid down for the future prosecution of this work.

The new departure consists in the co-operation of the soft coal interests with the city officials. Heretofore they have been wholly antagonistic, the soft coal miners and dealers looking upon the efforts to cure the excessive production of smoke as a crusade against soft coal and a movement in support of the business of their competitors, the anthracite coal dealers. They insisted that smoke preventing devices were a failure, and that, even if soft coal was burned in a way to emit the largest possible volume of smoke, the smoke rolling from a chimney was an evidence of activity and prosperity, and should not be branded a nuisance, especially if the smoke producing coal came from Illinois mines. But the inflexible stand taken by the city administration compelled them to change their tactics, and, at a conference recently held by the soft coal dealers and miners with the authorities, it was found that common ground could be struck on which both could work. The soft coal representatives now acknowledge that a steam plant can be so constructed that it will consume soft coal without the emission of dense smoke. They admit that a very great deal of the smoke nuisance in Chicago is caused by the faulty boiler settings. Therefore they agree that, in order to prevent a reduction in the consumption of soft coal through the enforcement of the smoke ordinance, an intelligent supervision must be established over the installation of new power plants, and the faulty plants in existence must be altered and improved.

The outcome of the conference is to be a new ordinance which will consolidate the several independent bureaus created at various times for boiler inspection, smoke inspection, elevator inspection and the licensing of stationary engineers. It is proposed under this ordinance to permit no one to install a steam plant unless all the regulations of the new department are complied with, and these regulations will provide for a properly constructed plant with sufficient draft and other details necessary for the perfect combustion of coal. Permits for repairs to old boilers will be refused unless the plans are approved by the department. The consolidation of all these bureaus into one department is such a common sense proposition that it is remarkable that it was not done long since. Under an arrangement of this character the responsibility for a chimney befouling the entire vicinity is a comparatively easy matter. If it is the fault of imperfect boiler setting the fact is authoritatively established and the owner is the party to be fined for violating the smoke ordinance. If, however, the plant is properly built, and the engineer or his fireman is careless or inefficient, that fact is established and the engineer's license is revoked, for he is held responsible for his fireman. The soft coal interests will not be discriminated against under such an ordinance, but on the contrary a systematic regulation of steam plants will be introduced which will be of benefit to them by demonstrating the possibility of smokeless or almost smokeless firing with soft coal. At present they are resting under a stigma in every city, which has been brought upon them by the unscientific or unintelligent use of soft coal or by the forcing of power plants beyond their legitimate capacity.

The annual report of the State Mine Examiner of Alabama shows that last year 4,246,736 tons of coal were mined in the State and 9280 people employed, as against 5,270,042 tons and 10,280 people for 1893. The falling off was caused by the coal strike of the summer.

For the first time in 30 years the Delaware River was, on Sunday, solidly frozen over between Philadelphia and Camden, N. J., and people crossed on the ice from shore to shore.

Trade Notes.

The West Side Foundry Company of Troy, N. Y., have issued an illustrated catalogue of stable fittings, &c., which is likely to prove interesting to many of our readers. Among the goods illustrated are Stall Guards of cast iron, crimped wire, wrought iron and square mesh crimped flat iron, Stall Panels of cast iron; also Ventilators and Door Panels, Hinges, Hay Racks, Salt Dishes, Hog Troughs, Hitching Posts, Blanket Brackets, Harness Hooks, Pole Brackets, Stable Gutters and Covers for wood or cement floors, Caldrons, Cuspidors, &c.

The annual meeting of the stockholders of the Novelty Stamping Company, Bellaire, Ohio, was held recently and the result of the year's business was reported as being very satisfactory, although no dividend was declared. The capacity of this concern for the manufacture of railroad and tubular lanterns, stamped ware and sheet metal specialties has recently been doubled, the firm having added to their equipment a No. 14 Bliss press at a cost of $5000. At the present time the firm have sufficient orders on hand to guarantee steady operations for the next six months.

The new addition to the McCullough Iron Company's works at Northeast, Md., is nearing completion. It will replace the building burned some time ago.

The Ansonia Brass and Copper Company, Ansonia, Conn., have leased the factory formerly occupied by the Aluminum Brass and Bronze Company, Bridgeport, Conn.

A big warehouse fire in Louisville, Ky., on Sunday, February 10, involved severe losses to the Louisville Tin & Stove Company, 122 to 128 Eighth street, and Myer, Bridges & Co., hollow ware and wooden ware, 815 West Main street. The losses are said to be entirely covered by insurance.

In their advertising space this week Gummey, Spering & Co., Philadelphia, print a testimonial letter received from Fieber & Holmes, Brookville, Ind., in which they give their experience with Gummey's Anti Pinhole Tin, which they have used for coffee pots and boilers, and have given it remarkable tests with most excellent results. Messrs. Gummey, Spering & Co. have taken much trouble to bring out this plate and are much gratified with the excellent properties it has shown in use.

The firm of Evans & Robertson, Cincinnati, Ohio, have been succeeded by the W. F. Robertson Steel & Iron Company, whose office is in the Chamber of Commerce Building, W. F. Robertson having purchased the entire interest of Charles Evans in the old concern.

G. A. Crosby & Co., 176 and 178 South Clinton street, Chicago, are now carrying in stock a full line of Tinners' Tools, comprising Crimpers and Beaders, Seaming and Grooving Machines, Pipe Formers, Wiring Machines, Turners, Burring Machines, Forming Rolls, Bar Folders, Tinners' Stakes, &c., and Tinners' Small Tools.

STOVE TRADE NOTES.

The Chicago Stove Trade.

Nobody expects to do a very large volume of business at this time of the year. It is midwinter, and although it has been unusually cold throughout the Northwest for the past month, the trade in heaters has not been stimulated. The usual scattering orders have been received, but the wants of the country had been well supplied when winter set in. Protracted cold spells of excessive frigidity may make people buy more coal, but not additional stoves. The dependence of the trade is now on the various forms of cooking apparatus. Cook stoves and ranges are a constant necessity without regard to season. The demand for these has been fair, but manufacturers report a varied experience. Some have done but little—so little that they take a gloomy view of the situation. Their sales are below those of the corresponding period of last year, and they see no basis on which to rest hopes for the future. To them the outlook is bad, and will continue so until farmers get better prices for their produce. But others are much more cheerful. Either their goods are more popular, or they have more energetic salesmen, or they depend less on purely agricultural communities. A refreshing experience is noted in the case of a few houses who have actually received carload orders. These orders may not all have called for very large carloads, but they have been big enough to class in that category.

The various stove foundries in the Northwest are quite generally in operation. But so far as known at this writing, very few, if any, are running full time. Some are on half time and others vary from that up to five days per week. This is due to the stocks carried over from last season. Manufacturers made more stoves in 1894 than they were warranted in doing by the actual condition of trade. But they were anxious to keep their working force organized, or else they were prompted by pure philanthropy to accumulate even excessive stocks in giving their workmen employment so that the latter could provide food for their families. These stocks now prevent the resumption of work on full time, for obvious reasons. If the demand were large enough to move the current output of the foundries the case would be different. It is to be hoped that as the year advances the prospects of trade will brighten, so that fairly full employment may again gladden the hearts of all interested.

It might be supposed that such times as we have endured for the past two years would check enterprise and cause manufacturers to confine their attention to the devising of plans for moving more stoves of the kind they are already making. This, however, is not the case. Designers and pattern makers have not found their occupation gone, but they are still connected with the stove trade and have a goodly clientage. New stoves may not be so numerous this year as they have been in more prosperous times, but nevertheless quite a number of stove companies will bring out notable additions to their lines. Considerable enterprise is shown in the direction of steel ranges. Manufacturers of cast goods are giving increased attention to steel construction, as they perceive a growing fancy for ranges of that character among their customers. It is a curious feature of current trade that notwithstanding the hard times the demand for steel ranges is increasing steadily, although they are as dear, if not dearer, than the best class of cast ranges. It appears to be the ambition of housewives to own a steel range when one of their neighbors thus furnishes her kitchen.

The St. Louis Stove Trade.

In view of the extreme cold weather prevailing throughout the section tributary to St. Louis the natural supposition is that the stove foundries would be running full turn to fill the demand. Such, however, is not the case. Inquiry reveals the fact that retailers have bought very sparingly during the past 60 days and have endeavored to clean up stocks which they carried over from the last two seasons. The cold weather has caused stoves everywhere to be forced to their full capacity, so that next fall will find many of them unfit for use, and the outlook for a good trade at that time is decidedly encouraging. Notwithstanding the dullness, manufacturers are not idle but are busy on their lines for this year's trade. Visits to the pattern shops of the local foundries find them working larger forces than for some time past. In fact one concern was compelled to advertise for additional pattern makers. This indicates that the local stove men will be in the market with goods that are "up to date" in every particular. Steel ranges will be pushed with much vigor during the coming season and three of the four St. Louis foundries will have exceptionally full and complete lines of ranges to offer to the trade.

The sale of furnaces has been satisfactory and the test to which they have been put by the extreme weather has been a severe one. The wood burning air tight heaters have sold in large quantities and it is estimated that between 15,000 and 16,000 were made in St. Louis during the past season.

The gasoline stove trade opens with excellent prospects. The local manufacturers have made extra improvements in their goods, which will, it is hoped, be followed by an increased sale during the coming summer months.

Amos C. Barstow.

The annual meeting of the Barstow Stove Company was held at the company's office in Providence, R. I., on Saturday, February 9, at which the secretary presented a paper to the stockholders of which the following is a copy:

At the regular meeting of the New England Stove Manufacturers' Association, held at Boston October 18, 1894, the following resolution was unanimously adopted:

Resolved, That this association, through proper resolutions, express its sense of loss in the death of Hon. Amos C. Barstow, and that a committee of three be appointed to draft such resolutions, to be forwarded to the family and business associates of the late Mr. Barstow, and that a copy of the same be entered on the records of the association.

George W. Walker, Albert N. Parlin and J. R. Prescott were appointed a committee, and herewith hand you a copy of the resolutions prepared and reported by them.

Whereas, Death has removed one of our valued associates since our last meeting;

Resolved, That in the death of the Hon. Amos C. Barstow we recognize a sense of loss in which the whole community where he was known must share. Although he was not actively connected with our association, he was known to us by a reputation which made him one of the most prominent men ever identified with our trade.

His abilities and virtues enabled him to command in an unusual degree the confidence of others, and the stove trade feels itself honored in the long list of public and private offices and positions of trust held by him.

We bear testimony to his honorable career as a merchant and to those graces of manner and character which endeared him to so many as a friend.

To his associates in business and to his family we extend our sympathy and place upon the records of the New England Stove Manufacturers' Association this tribute of respect and esteem.

GEO. W. WALKER,
A. N. PARLIN,
J. R. PRESCOTT,
} Committee.

Cupola Tuyeres.*—V.

BY DR. EDWARD KIRK.

Hight of Tuyeres.

There is a wide difference of opinion among foundrymen as to the hight or distance tuyeres should be placed in a cupola above the sand bottom. So great is this difference of opinion at the present time that tuyeres are placed in cupolas at from 2 inches to 5 feet above the sand bottom. This wide variation in the hight of tuyeres is due to some extent to the different classes of work done in different foundries, it being claimed by foundrymen making heavy work that it is necessary to have the tuyeres high to hold molten iron in the cupola and keep it hot for a large casting. Foundrymen making light castings requiring very hot iron draw the iron as fast as melted, and do not think it necessary to have high tuyeres to hold iron in the cupola. In the many experiments I have made in melting iron in a cupola I have placed the tuyeres at various distances above the sand bottom, and closely observed the effect of tuyeres at different hights. I learned by these experiments that the fuel under the tuyeres is not consumed in melting, nor is it wasted away to any extent by the heat or molten iron coming in contact with it. Charcoal may be placed in the bottom of a cupola, and if care is taken to prevent it being consumed by admission of air through the front before the blast is put on the charcoal will not be consumed during the heat and may be found in the dump. I have tried this in my experiments to soften hard iron by bringing the molten metal in contact with charcoal in the bottom of a cupola and found it correct. Pieces of charred wood used in lighting up are often found in the dump after having remained in the cupola through a heat. If these soft combustible substances are not consumed under the tuyeres, then it is not at all likely that the less combustible hard coal and coke are consumed. No iron can be melted in a cupola under the tuyeres, and the only function of the fuel below the tuyeres is to support the stock in a cupola above the tuyeres. If there is not sufficient heat in the bottom of a cupola to consume wood or charcoal, then there is not sufficient heat to keep molten iron hot for any length of time; and it is a well-known fact among practical foundrymen that large bodies of molten iron can be kept hot and fluid for a greater length of time in a ladle when covered with charcoal to exclude the air than it can be in a cupola.

Another reason given in favor of high tuyeres is that it is necessary to have them high to tap slag in long heats. The only slag in a cupola that can be drawn from it through a slag hole is a light fluid slag that floats on top of the molton iron or rests on the bottom of the cupola when there is no molten iron in it, and this slag may be drawn at any point between the sand bottom and tuyeres. When a slag hole is placed high, slag can only be drawn when the cupola is permitted to fill up with molten iron and raise the slag upon its surface to the slag hole. Slag may then be drawn for a few minutes while the cupola is filling up with iron to the slag hole. As soon as the iron reaches the slag hole, however, it flows out and must be tapped from the front. The slag then falls in the cupola with the surface of the iron as it is drawn off and the slag hole must be closed to prevent the escape of blast through it. Iron tapped after permitting a cupola to fill up to a high slag hole is always dull.

When a slag hole is placed low it is not necessary to have the cupola fill up with iron before slag can be tapped, for the slag may be drawn off the bottom of the cupola, and, furthermore, the slag hole may be opened and permitted to remain open through a heat without waste of blast. The flow of slag regulates itself when the hole is of a proper size. It is, therefore, not necessary to place tuyeres high that slag may be drawn from a cupola, nor is it necessary to hold iron in a cupola for a large casting or to keep it hot. Molten iron should be handled in a ladle and not in a cupola.

Hot iron for light work cannot be made in cupolas with high tuyeres, and for this reason the tuyeres in stove foundry cupolas are always placed low. In cupolas of large diameter, having a large bottom surface for molten iron, the tuyeres are placed so low that those at the back of the cupola are not more than 1 inch above the sand bottom, and those in front not more than 2 or 2½ inches above the sand bottom. Tuyeres placed in this way give ample space below them to hold molten iron for this kind of work, for the iron must be very hot and is drawn from the cupola as fast as melted, and the cupola is large enough to melt iron as fast as it can be handled, and it is only when the cupola is not working free that it is stopped up to accummulate iron. The tuyeres in any cupola may be placed as low as in these large ones, if provison is made for handling the iron as fast as melted.

In smaller cupolas not capable of melting iron sufficiently fast to fill a 40-pound hand ladle every 8 or 10 seconds the tuyeres are placed from 2 to 4 inches above the sand bottom, so that a sufficient quantity of iron may be collected before tapping to give each man in the section catching a hand ladle full and fill the ladle in about 6 seconds.

In cupolas of very small diameter the tuyeres should be placed from 6 to 10 inches above the sand bottom. These very small cupolas melt so slow that if the iron is drawn as fast as melted the stream is so small that the iron is chilled in flowing from the cupola to the ladle more than it is by holding it in the cupola until a body of iron is collected sufficient to supply a large stream.

In machine and jobbing foundry cupolas tuyeres are generally placed from 18 to 24 inches above the sand bottom. The object in placing the tuyeres so high is to hold iron in the cupola for a large casting. But, as before explained, this is not necessary or advisable. Another reason for these high tuyeres is that they are necessary for tapping slag. The slag from many cupolas is drawn off at the tap hole with the iron, and a number of spouts have been invented for separating the slag from the iron and preventing it running into the ladle. Slag may be drawn from the back of a cupola on a level with the sand bottom at that point, if the iron is drawn as fast as melted, or it may be drawn 1, 2 or more inches above the sand bottom at that point. It is, therefore, not necessary to place tuyeres at so great a hight to tap slag.

The tuyeres in cupolas for heavy work should be placed from 6 to 8 inches above the sand bottom when slag is not to be tapped. This gives an abundance of room in a cupola for holding iron while removing or placing a large ladle, and that is all that is necessary. The tuyeres in many of the cupolas used in Bessemer steel works are placed 5 feet above the bottom. They are probably placed at so great a hight because the tuyeres in the first cupola constructed for this work were placed at that hight. Tuyeres in all cupolas should be placed as low as they can be for the size of the cupola and facilities for handling the iron, for the fuel placed in a cupola under the tuyeres is not consumed in melting and is wasted by being heated in the cupola and crushed and burned in the dump. The value of fuel wasted every year in the United States by the use of high tuyeres in cupolas is sufficient to make a man rich.

* Copyrighted, 1894, by Edward Kirk.

ODD PLATES.

THE WORKS of the Ohio Stove Company of Portsmouth, Ohio, have begun operations again after a shut down of several weeks. The plant has been enlarged and improved and work is resumed with a full force.

THE WEST SIDE FOUNDRY COMPANY of Troy, N. Y., favor us with illustrated circulars of some of the specialties which they are offering the trade. Among these may be mentioned the Paris Ideal six-hole range with smokeless attachment; the Masterpiece, a square base burner which has recently been placed upon the market; the Improved Paris Imperial, a new surface burner, made in three sizes; the Paris double draft, a six hole range of attractive design; the Paris Marvel, a four hole range for hard coal or wood; the Paris Home Comfort, a six-hole range of the latest pattern, and the Paris cottage parlor and range combined. The company have in process of preparation a new stove catalogue which they expect to distribute to the trade in the course of a few days.

THE EVANSVILLE STOVE WORKS, Evansville, Ind., have recently enlarged their warehouse. They started up their works on the 13th ult., running with a full force.

RATHBONE, SARD & CO. of Albany, N. Y., are distributing to their friends an interesting puzzle, the solution of which will help to occupy many an hour in these dull times. The puzzle consists of a paper dumb bell about 5 inches in length, the ends carrying representations of acorns and the inscription "Acorn stoves and ranges." Between the ends and upon the bar portion are three rings so placed that at first glance the puzzle seems impossible of solution. The idea is to take off and replace the rings without bending the bar. Like everything else it is very easy when one knows how, but the "know how" is what is difficult to acquire.

NEW YORK STOVE MEN are reaping honors and Walter A. Clark of the Phillips & Clark Stove Company, formerly of Troy, N. Y., and now of Geneva, is getting a large share of them. Assemblyman Clark is now to be complimented upon his selection as treasurer of Hobart College.

EDMUND T. RAFTERY, manager of the Chicago branch of Rathbone, Sard & Co., Albany, N. Y., is making his annual visit to friends in the East.

THE HOBRECKER STOVE COMPANY of Omaha, Neb., have issued a very neat catalogue of gasoline stoves, ovens and furniture which they are offering the trade for the season of 1895. The stoves are placed on the market under-

the name of the Insurance line. They comprise all styles of individual and single generator stoves, high juniors, low juniors, &c. The catalogue is a highly original production, abounding in poetry, quaint sayings and curious letters from queer customers. It is undoubtedly of a character to attract attention.

A HUGE LINEN BACKED CARD reaches us from the Michigan Stove Company, on which is printed a capital appeal to the reader. It very appropriately begins, "This cloth is not all wool and a yard wide," and then refers to the merits of Garland stoves and ranges. The Michigan Stove Company display much originality in these advertising devices. Manager Gardner comprehends both the art of catching the attention of a reader and then saying something likely to fasten itself on his memory.

THE PORTSMOUTH STOVE & RANGE COMPANY, Portsmouth, Ohio, despite the discouraging past and the uncertain outlook, have been doing a very satisfactory business. The company have at present more orders on their books than ever in the history of their business.

THE JOSEPH BELL STOVE & RANGE COMPANY of Muncie, Ind., are being represented this year on the road by J S. Bush, who is traveling in West Virginia, Kentucky and southern Ohio; C. M. Silkey in Illinois and eastern Missouri; T. J. Schultz in Indiana and northern Ohio, and G. W. Hasty in western Missouri and eastern Kansas.

THE CRAIG-REYNOLDS FOUNDRY COMPANY of Dayton, Ohio, have issued a circular letter to the furnace trade, intimating that now is the time to consider the handling of the Triumph, which they manufacture in several varieties. The company also manufacture hot water, steam and combination heaters, but the Triumph warm air furnace is their specialty. Accompanying the letter are a number of lesflets carrying illustrations of the company's lines. Among these we notice the Triumph All Cast heater, the Triumph Air Blast, the Triumph King, the Triumph Special and the Triumph steel furnace. These are shown with the outer casing removed, so as to enable the dealer to obtain a better idea of the internal construction than would otherwise be the case.

BISSELL & Co. of Pittsburgh, Pa., are to supply the grates for the Woman's Building at the Cotton States and International Exposition to be held at Atlanta, Ga., from September 18 to December 31 of the present year. The company have agreed to furnish 13 of their Peerless and Columbian grates of various styles, finished in electroplated brass, bronze and silver.

THE WEST SIDE FOUNDRY COMPANY of Troy, N Y., are building up a very gratifying trade in their specialties, and we understand they are seriously contemplating an addition to the north end of their molding shop, extending it 100 feet to 27th street. This will make the addition about 100 x 80 feet in size and give 8000 square feet of space. The 1½-story building on Third avenue, in which is located the office, is to be raised to the hight of three stories, the upper two floors to be used for storage purposes. A bridge will be erected connecting this addition with the mounting shop. In addition to the manufacture of stoves and ranges, the company make a number of specialties for other concerns, and these orders are increasing to such an extent that all of their space is now occupied. William Sleicher, Jr., is general manager of the company; John A. Sleicher is secretary and treasurer; Edwin A. Keating, for many years with Rathbone, Sard & Co., is the general sales agent, and W. N. Sleicher superintendent.

WE ARE INDEBTED to the Joseph Bell Stove & Range Company of Muncie, Ind., for a photograph of the New Belmont Arlington line of soft coal and wood cook stoves and ranges for 1895. The cooks are made in 14 sizes and there are four sizes of a six hole range, both square and reservoir, also with new style tea shelves and high closets. The goods are attractively finished, having nickel plated front door and oven door panels, outside oven shelf, tea pot shelf, oven door handles and damper handles. The mounting is of a high order and the castings are of fine grade. A new style of wood cook under the name of La Belle Arlington has also been brought out, the ornamentation and general appearance of which are similar to the Belmont Arlington. Fourteen sizes are made as well as the usual modifications. The company state that their traveling salesmen, for the brief period they have been out this year, have forwarded sufficient orders for these goods to warrant the statement that they will prove very popular.

THE PORTSMOUTH STOVE & RANGE COMPANY of Portsmouth, Ohio, have succeeded, through the assistance of Hon. William F. Kemmler, United States Consul at Horgen, Switzerland, in establishing an agency for their steel ranges at Thalmeil, Switzerland. The Swiss agent will be H. Berthold, an extensive dealer in stoves, ranges, &c. Consul Kemmler, in a letter to a local German paper, says that stoves and ranges are very expensive in Switzerland and he is of the opinion that American manufacturers can, with a little energy, build up a very profitable trade.

WE HAVE RECEIVED, with the compliments of the Leibrandt & McDowell Stove Company, 22 South Charles street, Baltimore, Md., and 123 North Second street, Philadelphia, a pocket map of Virginia and West Virginia, and also one of Delaware and Maryland. These maps are folded to convenient size for the pocket, and are inclosed in heavy paper covers, upon the second page of which are calendars for the year 1895. Upon the outside covers attention is called to the celebrated Farmer Girl cook stove and the lines of heaters, ranges and furnaces manufactured by the company.

OSCAR I. LUCE, president of the O. I. Luce Stove Mfg. Company, at Leeds, Mo., died Sunday, January 27, at his home, 2935 Woodland avenue. He was 40 years old and leaves a wife and three children.

THE INDIANA STOVE WORKS of Evansville, Ind., are about to increase their facilities by the erection of a three-story brick warehouse, permits for which have recently been granted.

THE BLOOMINGTON STOVE COMPANY of Bloomington, Ill., were incorporated on January 30, with a capital stock of $50,000. The incorporators were John W. Evans, Edwin H. Miner and Howard E. Hays.

THE NEWSOME COMBINATION HEATER COMPANY have recently secured ground on the east side of the City of Detroit, Mich., and it is their intention to soon begin the erection of a large factory for the manufacture of a combination oil heater, cooker and lighter. The leading spirit in the formation of the company was Robert R. Grange of Chicago, and he has associated with him as active members of the concern William Wright of Scotland, Simeon Newsome, J. A. Lotz and J. W. Berns, all of Detroit. At present the office and headquarters of the company are at 112 Gratiot avenue, where there are on exhibition samples of the goods mentioned.

WE HAVE RECEIVED FROM W. E. Puffer of 136 Beekman street, New York City, a copy of the 24-page pamphlet which he has issued relating to automatic furnace regulators. The device is described at considerable length, and directions are given for using the regulator and furnaces. More than one-half of the pamphlet is given up to testimonial letters, nearly all of which we notice bear date of January of the present year.

THE CONOVER FIRE PLACE MFG. COMPANY have reorganized their business under the management of the members of the late firm of J. S. Conover & Co. and are located at 7 and 9 West Thirtieth street, New York City. The warerooms of the company have been fitted up in attractive style and contain a fine display of wooden mantels, fire places and their furnishings in great variety of designs. The company make a specialty of architectural metal work, ornamental bronze for banks and offices, wrought iron grill work, floor and wall tiling, &c.

THE PALERMO MICA COMPANY, 27 Peck slip, New York, miners, importers and wholesale dealers, issue in very pretty form their 1895 standard price-list of selected mica, the list having taken effect January 1. The second page of the circular gives the standard price-list, the third page gives the prices of 1, 2 and 3 pound assorted packages, put up expressly for the retail trade, while the third page gives the retail price list of mica by the sheet. The printing is done on a fine grade of paper with red ink, and is a neat piece of work.

THE ROUND OAK STOVE WORKS of Dowagiac, Mich., are reported to have closed their works on the night of Friday, February 8, throwing out of employment between 300 and 400 men. We understand that the employees asked that the 1894 scale of wages be restored, and that a refusal of the demand on the part of the company resulted in the men going out and the closing of the works.

PRESIDENT CHARLES O. LYON of the Thatcher Furnace Company, 240 Water street, New York, is making a two weeks' trip through the West. He reports excellent results from the Thatcher hot air furnace and the Champion steam and hot water heater during the recent severe weather.

THE TOLEDO STOVE COMPANY of Toledo, Ohio, report the prospects for 1895 as very bright. They expect to produce a much larger tonnage than ever during the year, and with this object in view started their plant with a full force immediately after the holidays. Unfortunately, however, a fire occurred on January 22, which com-

pelled them to shut down for a time. As soon as the weather permits and the work of rebuilding has been completed, they will at once resume in all departments.

The Standard Lighting Company of Cleveland, Ohio, have just issued from the press an exceedingly attractive catalogue of New Process gas ranges for the season of 1895. The volume is printed in colors upon a good quality of paper, and bound in neat covers with embossed side title in gold. The illustrations of the stoves appear in a deep shade of green, while the text is printed in red. The opening pages call attention to the many novel features embodied in the New Process goods, and refer among other things to the high grade of workmanship, "careful selection of materials and testing, handsome appointments, graceful design and ingenious, effective simplicity." The New Process range is shown in numerous varieties of cabinet style, and in connection with each illustration are given the sizes in which the stove is made, the number of burners, size of bake, roast and warming ovens, chop broiler, stove top, size of step, weight, price, &c. Brief reference is made to hot plates, the Radiant gas heater, ovens, burners, valves, &c. The last page is devoted to a table of comparisons, showing the difference in the cost of cooking by coal and gas.

H. Waterman of 111 Beekman street, New York City, visited the trade on the line of the New York Central and Erie railroads during the past week. Mr. Waterman represents the Cleveland Foundry Company of Cleve land, Ohio, and secured some very gratifying orders.

George J. Ralph, for 20 years idenfied with the stove trade of Buffalo, succeeds H. E. Stambach as the Buffalo agent for the Garland stoves and ranges.

The Carton Furnace Company of Utica, N. Y., were delayed a couple of days in starting their cupola by reason of the severe storm which swept over the country the past week. They had their temporary building all up with the exception of the roof when the storm prevented further progress. They have contracted for their new foundry building, the iron work now being on the way. The contractors agree to give the company possession of the new building the first week in March, providing the elements permit. The company on Wednesday, February 13, lighted their cupola for the first time since the fire, thus making a loss in time of only eight days.

Sam S. Utter of 113 Beekman street, New York City, has been doing an export business during the past week. We understand that on Monday he made a shipment of goods to Honolulu, on Tuesday to Havana and on Wednesday to Rio Janeiro.

The Bridge & Beach Mfg. Company, St. Louis, Mo., who have been at work for some time past on a line of steel ranges, advise us that they will be ready to offer these goods to the trade about March 1. Circulars, catalogues, &c, are being prepared and will shortly be issued. These ranges will be substantially built and will, we understand, be moderate in price.

The Wolff Gas Radiator Mfg. Company, 164 Franklin street, New York, report a good trade in the Wolff gas radiator during the recent cold weather.

Illness of Secretary Thomas.

We are very sorry that we cannot give a more encouraging report of the condition of Secretary Thomas of the National Association of Stove Manufacturers. Last week he showed a slight improvement, and hope was expressed that it might prove a permanent change for the better. Since then, however, Mr. Thomas has been somewhat worse, and the report furnished us on Thursday of this week was that he had been failing during the preceding three days. All will hope that in our next issue we may give brighter news, but we fear there is little ground for this hope.

Hints in Regard to Window Display.

BY J. P. HUMES.

The show window might be termed a silent salesman, and if given the proper amount of attention will accomplish its object, namely, to attract the passers by and induce them to make purchases, or make an impression upon the looker on which will lead to purchases in the future. It serves as a reminder to forgetful people—to the busy man whose better half asked him to bring home a carpet sweeper or tack hammer, but it escapes his mind, until seeing the required article in a window his memory is refreshed and thus a sale is made.

Cleanliness.

To fulfil its object the window must be kept clean and neat both inside and outside, and the arrangement of the goods should be such that they will be pleasing to the eye. There is, I might say, hardly any limit to the kinds of goods suitable for display, for one must consider the fact that all classes and kinds of people pass stores.

The Kind of Goods.

I find it a paying plan to display a few wares that will appeal to the masses, and under that head I might mention goods such as Mouse Traps, Pocket Knives, Scissors, &c.; in other words, goods which some one wants all the time. Do not confine the display to any one class of goods, but have a variety of articles, among which every one will see something which will interest him.

Constant Changes.

Displays should be changed at least once a week, for while there are numbers of people who seldom pass the store there are hundreds of others who pass daily. If the display is not changed at least weekly it will not catch their attention, while if frequent changes are made in the display it will be able to attract all.

A Little Beforehand.

Seasonable goods should always be given a prominent place in the window, and it is a wise plan to display wares a fortnight before the season for their use opens. By so doing the lookers on are apprised that a certain article is handled, and when they require the same they will recall having seen the article in the window. The probabilities are that they will then purchase. Hardware stores, as a rule, seldom have sufficient space in their windows to display articles in actual operation, and as such a display adds greatly to the expense I do not think such displays are profitable.

The Arrangement.

In making a display the goods should be so arranged that they will not only appear artistic in every way, but also so that the articles will appear to their best advantage. Avoid crowding a great number of goods in the window at the same time; do not try to show a sample of everything you keep at the same time.

Plain Figures.

To reap the full benefits of a display it is necessary to card each article shown, not only marking its price in plain figures, but also have some remarks on the price card in reference to the goods. The cards should be written so that he who runs may read, and so worded that they will to a certain extent interest the reader. Quotations from well-known authors, which apply to artices displayed, will interest the people. To explain more fully, I give, as follows, a few examples of cards:

BUTCHER KNIFE.

A better Knife did never itself sustain upon a butcher's stye.

50 cents each.

SAW.

Of all the Saws you ever saw, you never saw a Saw saw as this Saw saws.

Only $1 each.

SERRATED EDGE KNIVES.

Hot bread cut as easily as cold.

$1 a set.

MOUSE TRAPS.

The cat is minus a job since the Delusion was invented.

15 cents each.

BARLOW KNIVES.

Ragedy, O! Wherever I go, I am always known as Billy Barlow.

Warranted genuine imported Barlow's, only 25 cents each.

A window may be dressed in an economical way as follows: Have the floor of window built on an incline; cover the floor with colored material; make a border of two rows of brass jack chain; have the sides or walls painted white, on which can be placed a circle of Masons' Trowels, Hatchets, Saws, Dog Collars, Chains, or, in fact, any article which will show to advantage when tacked to the wall. Stretch from one end of the window to the other, about 3 feet from the floor, a brass wire upon which to hang suitable goods. Then make the main display on the floor. If the articles displayed are small, such as Picture Nails, Molding Hooks, &c., a dozen or so should be arranged in a semicircle or triangle. If the articles are large, one is sufficient. The clerk having the dressing of a window in charge should have an adaptability for the work, as it requires extreme good taste.

To Prevent Rust.

If the window is damp and it is found that bright goods rust when displayed, purchase some mercurial ointment and rub the article with it, and it will be found that the goods can be exposed to any amount of dampness and still retain their polish.

Definite arrangements are reported to have been made for the organization of a corporation to develop Southern industries and interests by the establishment of a permanent Southern exchange in New York City. The new corporation will, it is said, be a stock company, capitalized at about $200,000. An Executive Board of from 15 to 30 members, representing the different regions and interests of the South, will superintend its operations and direct its policy.

TRADE REPORT.

The Iron Market.

Reports are somewhat contradictory and reflect the contending influences which are shaping the situation. The business community is nervous over the financial muddle and is gradually working itself up to a high pitch of irritation, coupled with a pronounced contempt for the vast majority of politicians. No sound business revival need be hoped for until this country is known to be unquestionably committed to a square gold basis. Domestic or foreign capital will not go into new enterprises on a liberal scale until then, and without that stimulus our industries must drag along with insufficient work.

Outside of a fair run of sales of Lake Ore from the accumulations on the docks nothing has been done. Therefore the much talked of advance in prices has not yet been seriously tested. Some uneasiness has been created by numerous reports of a recurrence of labor troubles in the Coke trade. Some of the large interests have again accumulated big stocks of the fuel.

One bright spot is the condition of the Wire industry, which has been booking a very large tonnage. This is reflected in good sales of Wire Rods, with further large negotiations pending. It has also had its influence on Soft Steel Billets.

In the Foundry Pig Iron market, our Cincinnati correspondent notes that some large transactions are held in abeyance on account of the financial situation. In the Chicago district the local furnaces are well booked up, so that the Southern producers have had a chance to get some fair orders.

The Cast Iron Pipe trade records another record breaker in the way of prices, an Eastern foundry having carried off a 2300 ton order for Worcester, Mass., at the phenomenal price of $18 delivered.

Pig Iron.—The market in New York is rather a shade weaker, some efforts being made to push sales by Northern makers. Among the recent purchases are those of one consumer who has taken about 4000 tons to cover requirements up to August. We quote $12 @ $12.50 for No. 1; $11 @ $12 for No. 2, and $10.50 @ $11 for No. 2 Plain, standard brands, tidewater delivery. Southern Iron, same delivery, is selling at $11.25 @ $11.50 for No. 1; $10.25 @ $11 for No. 2; $10 @ $10.50 for No. 3; $10.25 @ $10.75 for No. 2 Soft, and $10.50 @ $10.75 for No. 1 Soft. Foundry No. 4 (Foundry Forge) is $9.50 @ $10.

In the Philadelphia Pig Iron market business has been very quiet during the past week, but there is no particular change in the general situation. The supply is fully equal to the demand, but at the prices now ruling further decline is almost impossible, so that consumers have no inducement to delay their purchases. On the other hand, there are so many sellers, and so many varieties of Iron, that buyers show no anxiety in regard to supplies, and are as unwilling as ever to make long contracts. Sales have been in moderate quantities at about the following prices for Philadelphia, and from 20¢ to 30¢ less for water delivery, or at points such as York, Harrisburg, &c:

Standard No. 1 Foundry X	$12.00 to $12.50
Standard No. 2 Foundry X	11.00 to 11.50
No. 2 Plain	10.75 to 11.00
No. 1 Soft	11.50 to 11.75
No. 2 Soft	10.75 to 11.00

Local furnace companies in the Chicago district report a fair run of orders for carloads, but no special movement beyond this. Shipments are increasing, the tendency still being to call for a greater quantity of Iron under contract. Agents of Southern furnace companies have entered orders aggregating 3000 tons. Lake Superior Charcoal continues very quiet. Quotations are as follows, for cash:

Lake Superior Charcoal	$13.00 to $14.00
Local Coke Foundry, No. 1	10.25 to 10.50
Local Coke Foundry, No. 2	9.75 to 10.00
Local Coke Foundry, No. 3	9.50 to 9.75
Local Scotch	10.50 to 11.00
Ohio Strong Softeners, No. 1	12.50 to 13.00
Southern Silvery, No. 1	11.50 to 11.75
Southern Silvery, No. 2	11.25 to 11.50
Southern Coke, No. 2	10.00 to 10.50
Southern Coke, No. 3	9.75 to 10.25
Southern, No. 1, Soft	10.25 to 10.50
Southern, No. 2, Soft	9.75 to 10.25
Alabama Car Wheel	17.50 to 18.00
Jackson County Silvery	15.50 to 16.00
Other Ohio Silvery	14.25 to 14.50

During the past week there has been more disposition on the part of furnaces in the Pittsburgh district to push sales, and a number of transactions involving 1000 and 2000 ton lots have been closed. Foundry Iron does not show any improvement, either in demand or price, the latter being much lower at this time than ever before. Quotations are as follows:

No. 1 Foundry	$10.50 to $10.65 cash
No. 2 Foundry	9.65 to 9.75 "

There has been quite a fair run of small orders placed during the week in the Cincinnati market, ranging from single cars to 100 ton lots and several sales of 500 tons, one lot of 1500 tons Mill Iron; but the large orders seeking placement have been suspended. While the outlook is improving there is too much uncertainty to allow any essential strengthening of the market and prices of all kinds are without change of importance. The unprecedented cold weather, too, has had a depressing effect. Shipments are retarded or suspended and mails delayed. Mills and foundries are gradually resuming, but even this impetus has received a check recently. Quotations are given as follows:

Southern Coke, No. 1	$9.75 to $10.00
Southern Coke, No. 2	9.00 to 9.25
Southern Coke, No. 3	8.50 to 8.75
Ohio Soft Stone Coal, No. 1	14.50 to 15.00
Ohio Soft Stone Coal, No. 2	14.00 to 14.50
Lake Superior Coke, No. 1	11.75 to 12.25
Lake Superior Coke, No. 2	10.75 to 11.50
Hanging Rock Charcoal, No. 1	16.00 to 16.50
Hanging Rock Charcoal, No. 2	15.50 to 16.00
Tennessee Charcoal, No. 1	13.00 to 13.50
Tennessee Charcoal, No. 2	12.00 to 12.50

Advises from St. Louis report that the demand for Pig Iron shows a slight increase without, however, any improvement in prices. Southern furnaces are not disposed to urge sales at prices ruling, as it is evident that the future appears more encouraging than it has for some time past. The local consumption has been increased by the starting up of two Stove foundries which have been closed down for the past two months. Sales during the week, while not large individually, aggregate a fairly satisfactory volume. We quote as follows for cash, f.o.b. cars St. Louis:

Southern Coke, No. 1 Foundry	$10.00 to $10.25
Southern Coke, No. 2 Foundry	9.50 to 9.75
Southern Coke, No. 3 Foundry	9.00 to 9.25
Southern Car Wheel	16.00 to 16.50

Metal Market.

Pig Tin.—The market has been remarkably steady through the greater part of the week. Arrivals, although quite heavy, have been well taken care of and so handled that spot stock has been kept at a considerable premium over regular February contract price. The premium averaged about 0.40¢, but was greater at intervals. More or less covering of short sales was prompted by tardiness of delivery notices and consequent apprehension that deliveries might be deferred long enough to cause inconvenience in speculative quarters if contracts were left open. This and other buying, along with the fact that the bulk of stock on spot and afloat for this point is well controlled by a few firms, has kept prices somewhat independent of London fluctuations. Distant future deliveries, while not traded in except to a limited extent, have ruled somewhat higher. The movement of tin into the channels of consumption continues liberal, or at the rate of not less than 400 tons per week. Later in the week the market assumed a tamer appearance, consumptive orders being lighter, and only a moderate jobbing business passing. Straits Pig in small lots from store rules at 14½¢ @ 15¢ ℔ lb.

Copper.—Irregularity in prices has continued, and the market has shown rather weak tone, the result chiefly of disappointing business on both home and export account, that has led to freer offering from outside sources or the small producers. Retail business has been very moderate, consumers showing little interest except in small lots for present use. Lake Ingot from store in small parcels is quoted at 10½¢ ℔ lb.

Sheet Copper.—The demand for Cornice Copper is very tame in this section and little of note is being done in the way of contracts for forward deliveries. Inquiry is, however, reported as fairly active, indicating the prospect of good business later on when the weather and general business conditions are more settled. The price asked for small lots of Sheet Copper from store is on the basis of 15¢ ℔ lb net.

Pig Lead.—The recent blockade on the railroads, owing to the severe storms, has operated to strengthen temporarily the price for American Pig in the East. Stock from stores conveniently located for immediate delivery to consumers' works has realized a slight advance, 3½¢ @ 3⅝¢ being quoted for moderate sized parcels. Otherwise the market has been bare of distinctly new feature. The demand

has continued moderate and the offering reserved, as for some time past.

Lead Pipe and Sheet — Nothing tangible in the way of improvement can be roported in the demand for Lead Pipe or Sheet Lead. Buying is still of the hand to mouth character, which has marked it for some time past, slightly increased, perhaps, in the past week by the requirements incident to repairs to plumbing work during the frost. Prices in this section are maintained at the list rate, namely, 5½¢ for Pipe, and 6¼¢ for Sheet, with 20 %.

Spelter.—There has been no improvement. In fact, the market has remained quite weak and positively dull, the extremely low prices being ineffective as an inducement to buyers. Western brands in small lots are quoted by jobbers at 4¢ @ 4½¢ ℔ lb.

Antimony.—Demand has been only fair and the market is rather weak under the influence of freer offering. Present prices for small parcels are about 8¢ for Hallett's and 9¼¢ @ 9½¢ for Cookson's, from store.

Nickel.—Sellers' prices are 35¢ @ 40¢, according to size of order.

Tin Plates.—The market in general during the past week has shown as checrless an aspect as it has exhibited at any time since the beginning of the year. Interest in forward deliveries of imported Plates has been entirely commonplace, and the business effected in this line by importing and jobbing houses did not at all equal the average of the preceding two weeks, although quite as attractive inducements in the way of low prices were made. There have been rumors, however, of contracts in this line having been placed with some American works. For the greater part of the week spot business has also been remarkably flat, although in the last few days, since the moderating of the weather, some improvement is noted in this respect, but orders have been almost invariably for small lots, and the entire business has made a poor showing. The domestic works generally are reported as starting again into operation, while advices from the other side are to the effect that more than half the Welsh mills are idle and the rest are only running fitfully. The market, as a whole, is in a most unsatisfactory condition, and prices are weaker than ever.

A special London cable dispatch of February 13 to *The Iron Age* reports on the British Tin Plate market as follows: The Tin Plate market is unchanged. Quotations are nominal in a great measure. There is more inquiry from Russia and San Francisco for future deliveries. Improved demand is noted for Black Sheets for America at £7. About one-half the Welsh works are now standing idle. Stocks at shipping point about 234,000 boxes. Quotations, f.o.b. Wales, are given as follows:

Bessemer Cokes, IC 14 x 20	9/	@ 9/1½
Siemens Cokes, IC 14 x 20	....	@ 9/4½
Ternes, 20 x 28	18/	@ 23/
Charcoals, IC 14 x 20	10/6	@ 13/

Sheet Iron.—Considerable inquiry is noted for future supplies of both Black and Galvanized Sheets. Consumers seem to be becoming impressed with the idea that prices have reached their lowest level, and the opinion is widely held that the present is a favorable time for closing contracts for future wants. Manufacturers, on the other hand, are not eager to book far ahead at the current rates. Some good sized orders are being placed for Black Plates for tinning purposes, and the productive capacity for these Plates is increasing rapidly with the starting into operation of old and new mills under the recent wage compromise. Jobbers' quotations for small lots of No. 27 Common Iron from store are about 2.65¢. Galvanized Sheets in small lots rule at 75 and 5% @ 75 and 10% off

Chicago Report.

Scrap.—The demand is light. Dealers quote their buying prices as follows, Chicago delivery:

	Per net ton.	Per lb
No. 1 Wrought Scrap	$6.50	....
Machinery Cast	5.50	....
Malleable Cast	5.00	....
Stove Plate (free of burnt)	4.00	....
Burnt Iron and Grate Bars	3.00	....
Sheet Iron and Hoops	2.00	....
Plow Steel and Breaking Stock	4.00	....
No. 2, such as Shovels, Hoes, &c.	3.00	....
Old Boilers—whole (Iron)	3.00	....
" (Iron)—cut in single Sheets and Rings	5.00	....
Old Gas-Pipe and Boiler Tubes	5.00	....
Cast Borings	3.00	....
Turnings	4.00	....
Horseshoes	7.50	....
Copper Bottoms	....	6 ¢
Copper Clips and Heavy	....	7 ¢
Heavy Brass	....	6 ¢
Light Brass	....	3 ¢
Pipe Lead	....	2½¢
Tea Lead	....	2 ¢
Zinc	...	2¼¢
Rubber		4 ¢

Anthracite.—The prolonged cold weather is at last affecting trade. Business is much better. The Soft Coal war is ended, the railroad companies having advanced their rates to old schedules. Carload lots of 12 net tons or over are quoted as follows, although some concessions are now being made:

	Egg, Sto. Grate.	and Ch.
Chicago, Ill	$4.75	$5.00
Milwaukee, Wis	4.75	5.00
Kansas City, Mo	7.95	8.20
Council Bluffs, Iowa	7.95	8.20
Lincoln, Neb	8 10	8.35
Sioux City, Iowa	7.95	8.20
Aberdeen, S. Dak	8.00	8.25
Dubuque, Iowa	6.05	6.30
Madison, Wis	6.25	6.50
St. Paul, Minn	7.25	7.50
Burlington, Iowa	6.25	6.50
Des Moines, Iowa	7.75	7.95
Davenport, Iowa	6.05	6.30
St. Joseph, Mo	7.95	8.20
Leavenworth, Kan	7.95	8.20
Omaha, Neb	7 95	8.20

Colorado Anthracite.

COLORADO FUEL & IRON COMPANY.

Denver	$8.00
Pueblo	8.00
Colorado Springs	8.00
Leadville	8.00
Cheyenne, Wyo	10.00
All points between Denver and Missouri River	8.85

TATHAM & BROS, 82 Beekman street, New York, manufacturers of Drop and Buck Shot, Bar and Sheet Lead, &c., have temporarily lost the use of the upper part of their shot tower, through damage by fire, which broke out in one of the upper stories Thursday afternoon, February 7. The tower, which has long been a landmark in that portion of the city, was constructed about 1858, and is 225 feet high, being built of iron columns filled in with brick. Portions of the tower will be in use in a few days and the balance shortly. There was no insurance.

THE EVERSON TUBE & METAL COMPANY are a new concern in Pittsburgh, Pa. The incorporators are: George H. Everson, M. H. Howell, Joseph A. Shinn, R. W. Richardson and John Owen.

CONDITION OF THE

Hardware Trade.

THE PAST WEEK has witnessed few changes in the market. Prices continue as for some time past without any general strengthening, but with a slightly better tone on a few lines. Some kinds of Hardware which have been low and demoralized are in no better shape, but on most lines prices are pretty well maintained on the low levels with which the trade are familiar. The improved condition in Wire Nails, Barb Wire and to some extent in Plain Wire are encouraging features, and on some of these goods the trade are recognizing the fact that it is the part of wisdom to have their requirements for the spring trade covered by orders and early shipments. There is a fair volume of business, but the extremely cold and severe weather which has prevailed so generally throughout the country has curtailed transactions considerably. Stocks are very low in the hands of jobbers as well as retailers, and the policy of keeping them so is still followed. The feeling is freely expressed by well informed business men that if the financial question was settled and monetary matters put in good and permanent shape there would be an early and marked improvement in trade.

Advices from Chicago.—Shelf Hardware jobbers have experienced a quiet week. The mails have been seriously interrupted by the terrific weather which so generally prevailed throughout the country and traveling men have been storm bound in every direction. Heavy Hardware jobbers report the receipt of good specifications from large buyers of Iron and Steel. Contracts which had been entered for March shipment are now being filled, as consumers are in need of the material earlier than was expected. Prospects are extremely good for larger business.

Notes on Prices.

Wire Nails.—The Wire Nail market continues in excellent condition and with substantially the same prices as were mentioned in last week's review. The tone of the market is firm, especially in view of the fact that manufacturers are well supplied with orders and inquiries are coming in in good volume. The opinion is expressed by those who are well informed that in view of the diminished production, as compared with last year, the mills, with only an average demand, will be fully occupied for several months to come.

Advices from Chicago.—Manufacturers are extremely busy, the largest concerns being furthest behind in shipments. Orders are good and the trade appears to be in excellent shape for another advance, which is daily expected. Local jobbers, however, are uninfluenced by the manufacturers' report of better business, and continue to cut prices as freely as ever, although manufacturers assert that a loss is netted on every keg sold at the low rates now prevailing. Small lots from stock here are selling at various prices, ranging from 95 cents to $1.05, according to the disposition of the seller. It looks now as if every retail merchant who wishes to buy Wire Nails cheaply should place his orders as quickly as possible, as prices may be advanced at any day.

Cut Nails.—There is little change in the Cut Nail market, but the condition is perhaps somewhat improved, as manufacturers are refraining from pushing for business with as much energy as they sometimes do. There is also a diminished output on the part of the mills, and this tends to give a slightly firmer tone to the market. Small lots from store, New York, are held at about 90 cents. Business is rather quiet.

Advices from Chicago.—Trade continues about the same as previously reported. Manufacturers are receiving orders, but not large ones. Small lots from stock are selling at $1.

Barb Wire.—The Barb Wire market is characterized by a good degree of activity and an excellent tone. Small lots from store in New York are held at $2.15 to $2.20.

Advices from Chicago.—Factories in this locality are well fixed with orders for the present and report prospects bright for a considerably heavier movement in March. Good inquiries are being received for large quantities. The improved demand for Wire Rods in this vicinity reflects the activity now prevailing in the Wire Nail and Barb Wire trade. Prices are unchanged. Small lots from stock are selling at $1.65 for Painted and $2 for Galvanized.

Freezers.—We are advised by the White Mountain Freezer Company Nashua, N. H., that they have abolished the system of list and discount in connection with the sale of their White Mountain, Granite State and Arctic Freezers, which they are now quoting at net prices. They refer to this change as simplifying the method of quoting and selling the goods.

Wringers.—The American Wringer Company, 99 Chambers street, New York, in issuing their price-list of Wringers under date of January 1, 1895, have rearranged it and made a few slight changes as compared with their circular of July 1, 1894. The second and third pages contain their standard high grade Wringers with iron and wood frames and for folding benches. The last page describes what are termed regular grade Wringers, with both iron and wood frames and for folding benches, at somewhat more moderate prices. They have also added the Star, iron frame, and Falcon and Crescent, wood frame, Wringers to those heretofore made.

Wrought Iron Pipe.—The lists recently adopted by the Pipe manufacturers and printed in full in our last issue have met with the general approval of the trade. It has for some time been recognized as desirable that the inequalities in the old lists should be corrected, inasmuch as if in an assorted order standard sizes were sold at cost under the old lists and discounts less salable sizes would be sold below cost. This condition of things has been recognized by the manufacturers for some time, and the new list represents an attempt on their part to make one based throughout on the cost of manufacturing the goods. This rather than to make an advance in the price of the goods was the object of the action taken by the meeting.

Glass.—The rigorous weather which has been so general throughout the country has contributed to the dullness which pervades the Glass trade, and with the usual quiet of the season has resulted in almost nothing being done for the past week. From indications building for the coming nine months will be on a much larger scale than for either of the two previous years; and if this proves to be the case the outlook is favorable for a larger demand for Glass. Reports from Pittsburgh indicate that the factory price for Glass in large lots is from 89 and 2 to 90 and 2 per cent. discount, though in some cases a price as low as 89 and 5 to 90 and 5 per cent. discount has been made. The New York market is represented by the following quotations: From store in small lots, 85 and 15 per cent. for Single, and 85 and 20 per cent. discount for Double Strength Glass. In car lots 88 per cent. for Single and 89 per cent. discount for Double Strength Glass.

Old Metals.—The demand for Old Metals is merely moderate, and prices exhibit no radical change. The following quotations represent the ruling rates paid by dealers, New York delivery:

Heavy Copper	℔ 7 ¢
Light and Tinned Copper	℔ 6½¢
Heavy Brass	℔ 4¾¢
Light Brass	℔ 3¾¢
Lead	℔ 2¾¢

Dr. Senner, Immigration Commissioner at Ellis Island, N. Y., in a report sent in to the Treasury Department, shows that during the year 1894 the total number of passengers sailing from New York, Boston, Phladelphia, Baltimore, New Orleans and Montreal was 311,760, against a total of 268,037 sailing from the same ports in 1893. During last year the number of immigrants arriving at Ellis Island was 167,585, who had in their possession $3,050,946 in gold. Steerage traffic from the United States to Mediterranean ports fell off considerably as compared with 1893, while steerage trsffic to Englsnd and Central and Northern Europe showed a large increase over the previous year. The hard times of 1893, when work was difficult to obtain, csused large numbers of Italians to return to their native country, while it had a contrary effect on people from Northern and Central Europe in keeping them in the United States. The total number of steerage passengers sailing from the United States in 1894 was 210,251, against 174,766 in 1893.

MANUFACTURING.

Hardware.

The Consolidated Barb Wire Company of Lawrence, Kansas, have secured the wire mill of the defunct Clark & Winsor Wire & Spring Company at Joliet, Ill., and are now drawing wire. They will manufacture barb wire as soon as they can put up the machines, and it is also their purpose to manufacture wire nails. The company have a large plant at Lawrence, Kansas, recently enlarged and greatly improved, but they find that some of their trade can be more conveniently handled from Joliet.

The Ansonia Brass and Copper Company, Ansonia, Conn., have leased the factory formerly occupied by the Aluminum Brass and Bronze Company, Bridgeport, Conn.

The plant of the Eureka Mower Company, Utica, N. Y., was damaged by fire to the extent of $25,000 on the 5th inst.

An addition is to be erected at the works of Henry Disston & Sons, Philadelphia, which will be set apart for the testing of saws.

P. C. Sweeney has bought the plant of William Wilkinson & Co., sheep shear and cutlery manufacturers, Reading, Pa., and a stock company will be organized to continue the business.

Moore Bros., saw manufacturers, Jamestown, N. Y., will erect a new iron clad building, 50 x 24 feet.

The annual meeting of the Walter A. Wood Mowing & Reaping Machine Company, Hoosick Falls, N. Y., was held on January 31. The old board of officers was re-elected as follows: C. E. Dudley Tibbits, president; William S. Nicholls, vice-president; Danforth Geer, secretary; N. E. Russell, general manager. The directors elected were the following: C. E. Dudley Tibbits, Walter P. Warren, William S. Nicholls, LeGrand C. Tibbits, J. Russell Parsons, C. A. Cheney, N. E. Russell, John Wool Griswold and Danforth Geer.

The Syracuse Arms Company, Syracuse, N. Y., have increased their board of directors from five to seven of the stockholders. The new board is composed of George Timmins, Alexander Grant, F. S. Wicks, J. M. Colwell, F. B. Scott, Robert Croasdale and George G. Fryer.

Machinery.

At Akron, Ohio, in the case of Brownell & Co. of Dayton, Ohio, *vs.* the J. C. McNeil Boiler Company of Akron, Ohio, for balance on a flanging machine furnished by plaintiffs, the defendants have filed an answer and counter claim. They admit entering into a contract for a flanging machine to cost $2600, and that it was delivered January 10, 1893, but say that the machine would not do the work claimed for it. For a foundation built to place the machine on, for the loss sustained by its poor work, and for some $666.66 paid on account, they claim $3735.33, for which they ask judgment.

The James E. Thomas Company of Newark, Ohio, have recently added a No. 6 Whiting cupola to their foundry, which enables this concern to largely increase their output of ingot molds and similar castings.

The firm composed of Ernest G. Rippel and James T. King, in the machine and foundry business under the name and style of Rippel & King, Canal Dover, Ohio, were, yb mutual consent, dissolved on January 28, 1895, James T. King retiring. Ernest G. Rippel, who has purchased all the assets and assumed all the liabilities of the firm, will remain and carry on the business as usual in the same place under the style of the Rippel Manufacturing Company. The firm make a specialty of rolling mill and blast furnace castings.

Armstrong Brothers, boiler manufacturers, Springfield, Ohio, have been awarded the coutract for eight boilers, 65 inches in diameter by 20 feet long, each containing 22 tubes, 6 inches in diameter, riveted into the heads, for the new works of the National Tin Plate Company of Anderson, Ind. These boilers are to be completed with full flush fronts, all castings, fittings and stacks, and are to be suspended in furnaces by heavy eye beams. The approximate horse-power of the order is 1600.

The Morton Tin Plate Company, Cambridge, Ohio, have placed an order for two five-roll Morewood tiuning sets with the Lloyd Booth Company, Youngstown, Ohio.

Wm. B. Pollock & Co., Youngstown, Ohio, have been awarded a contract for a large amount of steel rivet pipe to be furnished the water works department of Clevelaud, Ohio. The contract amounts to $11,800.

The Cook-Stoddard Mfg. Company, have been organized at Dayton, Ohio, for the manufacture of gas engiues under patents owned by the company. The capital stock is $30,000.

The stockholders of the American Cotton Picking Company met at Pittsburgh last week and elected the following directors: George C. Chalfant, Homer Laughlin, T. J. Keenan, John B. Keaggy, Thomas R. Morris, A. Campbell, W. J. Morris.

The Babcock & Wilcox Company, through their Pittsburgh agent, have closed a contract with Pickands, Mather & Company, Cleveland, Ohio, to furuish 1500 horse-power high pressure boilers, to carry 250 pounds pressure, to be used on a freight vessel now being built by the Chicago Ship Buildiug Company. A contract for the same amount of boilers has been received from a concern located in the vicinity of the lakes, to be used on a passenger vessel.

LABOR EXCHANGE.

Notices under this heading of reasonable length are inserted free of charge. Only those relating to employment are admitted. Write distinctly on one side of paper only, and do not use postal cards.

HELP WANTED.

One or two good SNAP MOLDERS to work on stove plate work. Ohio Stove Company, Portsmouth, Oblo. Feb. 16

Simplicity, Adjustability, Neatness and Strength.

HOW TO KEEP A STORE.

By S. H. TERRY.

406 PAGES, 5x7½ INCHES.

This book should be in the hands of every one interested in the selling of goods at retail. Among the subjects discussed are: The selection of a business; choice of a locality; buying a stock of goods; examining, marking and arranging goods; how to advertise; employment of clerks; selling for cash and credit; keeping accounts; expenses; copartnerships; losses by fire, theft, &c.; influences of social life on business; buying at auction; investment of profits; insolvency; business qualifications. Every branch of the retail trade is treated upon in a direct, business-like manner. It is a thoroughly practical book for merchants and clerks. **Price, $1.50.**

SECOND EDITION.

PRACTICAL HINTS

—ON—

JOINT WIPING,

FOR BEGINNERS IN PLUMBING,

WITH THIRTY-FIVE ILLUSTRATIONS.

48 PAGES. PAPER, 25c.

This book contains a reprint from *The Metal Worker* of two articles on the method of Joint Wiping, an operation calling for a very large degree of manual skill.

The first account is written by a practical plumber, and is illustrated from photographs faithfully representing the hands and tools when wiping joints in various positions.

The second account, by an expert joint wiper, is also illustrated from photographs and will prove of great assistance to learners.

Ample instructions are given on preparing the pipes previous to wiping the joints, with full descriptions of all tools and appliances used.

The pamphlet, in short, gives all the assistance that description of the work can furnish and is the most practical and complete account of joint wiping that has been published.

Sent, post-paid, on receipt of price, 25c.

ROYAL

WASH BOILER HANDLE.

PATENTED.

We call the trade's special attention to the Royal Handle, being the cheapest and the most durable handle in the market, fully protected by a number of letters patent, and all manufacturers using the handle report that their trade on wash boilers has largely increased. Over 100,000 handles sold in our local trade last year.

The advantages gained by using the Royal Handle can be readily seen, as it far excels the old fashioned tin or iron drop handles in beauty and strength, fits the hand perfectly and is always cold and adds greatly to the general appearance of boiler. Manufactured only by

AN IMPORTANT FIXTURE.

A new Water Closet for Hospitals, School Houses and Public or Private Buildings.

THE

Puritan Wash-Down Water Closet.

PATENTED.

WHY THE PURITAN WASH-DOWN IS BETTER THAN ANY OTHER FORM OF CLOSET.

It is simple and compact. The Tank being connected directly to the closet does away with unsightly pipes on the wall and reduces the noise to a minimum, and at the same time being more effective and has a larger surface of water. The joint where the earthenware connects with the soil pipe is under water, which is an absolute safeguard against the leaking of sewer gas. It is especially adapted for fire-proof buildings, and the soil pipe can run on the floor either in front or behind the partition. There is no chance for stoppages and there are no concealed spaces, all parts being accessible.

The body of the closet is made of vitreous or non-absorbing ware and is perfectly sanitary.

GOOD FIXTURES ARE CHEAP, AND POOR FIXTURES ARE EXPENSIVE.

Each Closet is guaranteed for a term of years. Call and see the operation of the Closet at our **SHOW ROOM.**

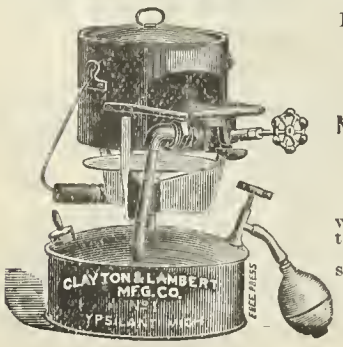
Columbus

WROUGHT STEEL SINKS

ARE DRAWN FROM A SINGLE SHEET OF STEEL, AND ARE SUPERIOR TO CAST IRON SINKS IN EVERY PARTICULAR; BEING LIGHTER, STRONGER AND MORE DURABLE. WILL NOT BREAK FROM HEAT, COLD OR ANY CAUSE WHATEVER. BEING LESS POROUS THAN CAST SINKS, ARE COMPARATIVELY ODORLESS, AND THEIR GREAT ELASTICITY AVOIDS THE BREAKAGE OF DISHES.

THE BOTTOM IS FORMED TAPERING TO THE CENTER AND THE OUTLET, SO THAT THE DRAINAGE IS PERFECT, AND ENABLING THE ATTACHMENT OF STRAINER AND PIPE MORE SATISFACTORILY THAN IS POSSIBLE WITH ANY OTHER MAKES.

We Are The Originators



Of the Wrought Steel Sink, and are in position to supply them in any style finish desired, and in many different shapes, at prices that will be named.

THE IRWIN & REBER
PATENT

EXPANDING WATER CONDUCTOR.

MANUFACTURED BY THE

S. S. S. Conductor Co.
LIMITED,

163 Lacock Street,
ALLEGHENY, PA.

THE STANDING SEAM allows of an easy and secure fastening, keeping the pipe far enough from the wall to make any overflow from the eave pipe or head, run down the spout, and not the wall; and will open, in case of freezing, so as to prevent bursting, and still remain double-locked and water-tight.

Made in 6-foot lengths of a single sheet of SOFT STEEL.

GALVANIZED, KALAMEINED or LEADED.

The Irwin & Reber Expanding Water Conductor Pipe has been extensively used through the United States and Canada for the past ten years and has proved itself to be the best in the market. Send for Price-List.

The Climax Ratchet Stock

Is an indispensable tool for conveniently threading iron pipe in ditches, under floors, in corners, over head, etc. With this tool threads can be cut without removing whole lengths of pipe. This tool is provided with a strong vise which securely grips the pipe, and by means of the leading thread the die is forced on pipe and the thread is cut. It is made of malleable iron and steel, and while light in weight, making it convenient to carry, is very strong and rigid. The advantages of this tool make it absolutely indispensable to Plumbers, Steam and Gas Pipe Fitters, Gas and Water Companies, Machinists, etc. It takes standard size dies, which are extra if furnished.

No. 1 threads ¼ to 1 in. pipe, takes 2 or 2½ in. die, $10.00

No. 2 threads 1 to 2 in. pipe, takes 2½, 3 and 4 in. die, $17.00

For sale by leading jobbers.

WESTERN AGENTS: ILLINOIS ROOFING & SUPPLY CO. CHICAGO, ILL.

Gummey's Anti Pin Hole Bright Tin Plate.

By permission of Messrs. Fieber & Holmes, Brookville, Indiana, we insert the following testimonial:

BROOKVILLE, IND., FEB. 1, 1895.

Messrs. GUMMEY, SPERING & Co.,
Philadelphia.

GENTLEMEN:

We have some Coffee Pots and Boilers made from your Anti Pin Hole Tin which have been in use over a year and only one of them ever came back for repairs. In this one case it had a flat copper bottom, and the *bottom* was worn out. We carefully examined the tin on the inside and could not see that it was eaten a particle This Boiler was a very large one for the County Poor Asylum.

Yours truly,

(Signed) FIEBER & HOLMES.

NEW CASTLE

AMERICAN BRIGHT TIN AND TERNE PLATES

Made at our Extensive Works direct from

LAKE SUPERIOR ORES.

Equal to the "Best in the World," If you don't believe it send for samples.

New Castle Steel and Tin Plate Co., New Castle, Pa.

NOTICE.

It has come to my knowledge that certain parties are offering an exact duplicate of our Phillips-Newbold Tinning Machine, including our Flue arrangements, both of which are protected by patents, and hereby give notice that any user of such Pots and Machines will be held responsible for damages, without reference to the builders thereof.

I have this month sold nine of our Phillips-Newbold Machines to run on special work where other pots are being run on such work as they are adapted for. (Signed) F. R. PHILLIPS, Philadelphia, Pa.

Phelps, Dodge & Co.,

Also the Celebrated Phelps' Treble Coated Roofing Plate.

FOLLANSBEE BROTHERS COMPANY,

Successors to

James B. Scott & Co,

Manufacturers of the well and favorably known "**Scott's Extra Coated**" guaranteed Roofing Tin. **Trade-Mark Registered.**

The officers of this Company are the surviving members of the old firm, and the management, manufacture and inspection of each plate are in charge of the same individuals as heretofore.

Also sole factors

Blairsville Rolling Mill and Tin Plate Co.,

Manufacturers

Black Plate, Tin Plate, Terne Plate.

Offices and Warehouses, 122 and 124 Second Ave.,

PITTSBURGH, PA.

BEWARE OF IMITATIONS.

"BREVITY" MAY BE "THE SOUL OF WIT"—

But short pieces of tin do not make "TANDEM" CONTINUOUS ROOFING....

CUSTOMERS are told what to expect—and get it. In "TANDEM" they get a roll of good, prime tin, made of sheets 96 in. long, furnished either 14 in., 20 in. or 28 in. wide; and, if desired, THOROUGHLY WELL PAINTED.....

"TANDEM" is put on the market under no false pretenses. It is not a light weight tin; it is not made from 14 x 20 in. or 20 x 28 in. sheets—and IS NOT SOLDERED BY HAND.....

"TANDEM" Continuous Roofing Tin is made in IC and IX thicknesses. Primes and Wasters are sold separately. Before buying continuous roofing tin, be sure of what is being offered you in competition with "TANDEM".....

—ON—
FOUNDRY PRACTICE

The Encyclopedia of Founding and Dictionary of Foundry Terms,

used in the practice of molding. Together with a description of the tools, mechanical appliances, materials, and methods employed to produce castings in all the useful metals and their alloys, including brass, bronze, steel, bell, iron and type founding, with many original mixtures of recognized value in the mechanic arts. Also aluminum, plating, gilding, silvering, dipping, lacquering, staining, bronzing, tinning, galvanizing, britannia-ware, German silver, nickel, soldering, brazing, ores, smelting, refining, assaying, etc. By SIMPSON BOLLAND, Author of "The Iron Founder," "The Iron Founder" Supplement. 12mo.: cloth..... .....$3.00

The Pattern Maker's Assistant

Embracing lathe work, branch work, core work, sweep work and practical gear constructions, the preparation and use of tools, together with a large collection of useful and valuable tables. Sixth edition. By JOSHUA ROSE, M. E.; illustrated with 250 engravings; 324 pages: cloth.....$2.50

Modern Molding and Pattern Making.

A practical treatise upon pattern shop and foundry work. By JOSEPH P. MULLIN, M.E.: 257 pages; cloth; illustrated. $2.50

Iron and Steel Founding.

Illustrated with 39 diagrams. By C. WYLIE. Second edition, revised and enlarged; 324 pages; 8vo; cloth... .....$2

The Practical Brass and Iron Founder's Guide.

A treatise on brass founding, molding, the metals and their alloys, etc. By JAMES LARKIN, late conductor of the brass foundry department in the Penn Works, Philadelphia. A new revised and greatly enlarged edition. Contents: Among the most important and entirely new sections of this edition of this valuable and popular book are the following: Behavior of Metals and Alloys in Melting and Congealing; Malleable Iron Castings; Wrought Iron or Mitis Castings; Manufacture of Steel Castings; Casting of Brass; Casting of Bronze; Bell Founding; Chill Casting; Casting without Core; Casting on to Other Metals; Casting Iron and Other Metals Upon Lace, Emboroideries, Fern Leaves and Other Combustible Materials; Some Modern Bronzes. In one volume; 12mo; 400 pages.....$2.50

American Foundry Practice.

Treating of loam, dry sand and green sand molding, and containing a practical treatise upon the management of cupolas and the melting of iron. By THOMAS D. WEST, practical iron molder and foundry foreman. Fully illustrated. Eighth edition, revised. 408 pages; cloth.....$2.50

The Iron Founder.

A comprehensive treatise on the art of molding, including chapters on core-making, loam, dry sand and green sand molding, also crystallization, shrinkage and contraction of cast iron and a full explanation of the science of pressures in molds, added to which are formulas for mixtures of iron, tables, rules and miscellaneous information. By SIMPSON BOLLAND. Illustrated with over 300 engravings. 12mo, cloth....$2.50

The Iron Founder Supplement.

A complete illustrated exposition of the art of casting in iron, comprising the erection and management of cupolas, reverberatory furnaces, blowers, dams, ladles, etc., mixing cast iron, founding of chilled car wheels, malleable iron castings, foundry equipments and appliances, gear molding machines, molding machines, burning, chilling, softening, annealing, pouring and feeding, foundry materials, advanced molding, measurement of castings, wrought iron, steel, etc. Also the founding of statues, the art of taking casts, pattern modeling, useful formulas and tables. By SIMPSON BOLLAND. Illustrated with over 200 engravings; 400 pages; 12mo; cloth..... ...$2.50

The Smallest Electric Battery in the World.

In contrast to the very large generators of electricity—batteries and dynamo electric machinery—in such common use today, it may be interesting to note what is perhaps the smallest electric battery ever constructed and no doubt also the smallest generator of electrical or mechanicnl energy. Thls battery was constructed some years ago, says the *Manufacturer and Builder*, by one of the electricians of the Boston Telephone Company, and consisted of an ordinary glass bead, through which two wires, one of copper and the other of iron, were looped and twisted so as to prevent their coming in contract. The wires acted as the electrodes, and all that was necessary to cause a current to flow was to place a drop of acidulated water in the bead. Certainly such a minute battery furnished but an infinitesimal current, but could be easily used in a delicate telephone; in fact it is said to have actually been used in signaling to a distance of nearly 200 miles.

— QUALIFIED.—(Public School, First Grade, A. D. 1905.) Teacher (to applicant for admission): Johnnie, have you got a certificate of vaccination for smallpox ?"

"Yes, sir."

"Have you been inoculated for croup ?"

"Yes, sir."

"Been treated with diphtheria serum ?"

"Yes, sir."

"Had your arm scratched with cholera bacilli ?"

"Yes, sir."

"Have you a written guarantee that you are proof against whooping cough, measles, mumps, scarlet fever and old age ?"

"Yes, sir."

"Have you your own private drinking cup ?"

"Yes, sir."

"Do you promise not to exchange sponges with the boy next to you and never use any but your own pencil ?"

"Yes, sir."

"Will you agree to have your books fumigated with sulphur and sprinkle your clothes with chloride of lime once a week ?"

"Yes, sir."

"Johnnie, you have met the first requirements of the modern sanitarians and may now climb over yonder rail, occupy an isolated aluminum seat and begin making P's and Q's as your first lesson." —*Washington Star.*

— "ARE you the man who painted that 'ere picture of 'Moses in the Bulrushes ?'" asked a countryman of an artist who had recently startled the town by an exhibition of oil paintings.

"Yes," replied the artist.

"All right; then I want you to paint my father."

"Certainly, if he gives me a few sittings."

"Can't do it ; he's dead."

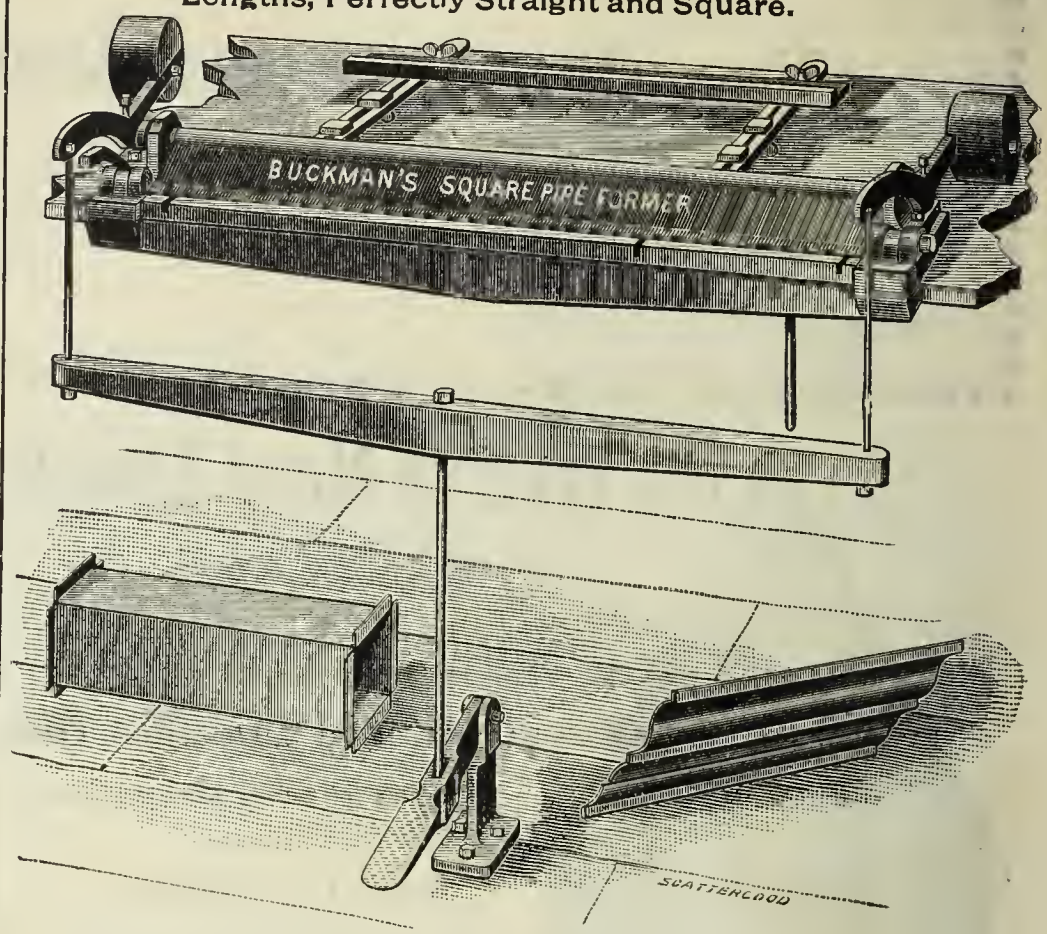
"Let me have a photograph of him."

"Can't do that, neither; he never had his picture taken."

"I am afraid, then, I must decline."

"Decline ! What for? Haven't you painted Moses ? You didn't have a photograph of him, did you? No, I thought not. Well, my father hain't been dead nearly so long as Moses. If you can paint Moses, you ought to know enough to paint my father."

Appreciating the situation, the artist went to work and evolved such a portrait as he thought might satisfy so original a son.



"Crikey !" exclaimed the art patron, on seeking the completed painting. "That almost knocks the stuffin' out of Moses ; but, I say, how he has changed !"

POCOCK'S ECCENTRIC

FORMING MACHINE.

We invite your attention to this new Former for Tinners' and Sheet-Metal Workers' Rolls, on which we claim rapidity of operation, superior construction and durability. The back roll is moved by eccentrics instead of screws, and can be changed instantly from the smallest circle to the passing of a straight sheet. It will flare metal easier and better than any other machine in use. You can get closer to front roll, therefore bend a smaller circle. For sale by all leading jobbers. Send for circular to

3-inch Rolls with Slip Rolls a specialty

— "FIGG is always setting a trap for his wife."

"Jealousy, is it?"

"Nope; mice."—*Chicago Inter-Ocean.*

— "WELL," said Hawkins on New Year's Eve, "Eighteen hundred and Ninety four is about over. It has been a pretty tough year."

"Yes: and it's a good thing it was tough," said Watson. "If it hadn't been it would have died six months ago."—*Harper's Bazar.*

THE METAL WORKER

PATTERN BOOK.

SEVENTH EDITION.

This is a handsome volume of 242 pages, printed on heavy paper, and substantially bound in cloth. It is illustrated by upward of 520 line engravings.

The work is comprised in five general divisions or chapters, bearing the following titles: (1) Definitions and Technicalities; (2) Drawing Tools and Materials; (3) Geometrical Problems; (4) The Art and Science of Pattern Cutting, and (5) Pattern Problems. These titles sufficiently indicate the subject matter of the several parts.

The List of Problems

demonstrated is very extensive, and embraces almost everything of common occurence in the sheet-metal trades, with enough of the exceptional to show methods adapted to special requirements. This chapter, in short, is a ready reference book for all who have pattern cutting to do. Each demonstration is complete in itself. A carefully prepared index facilitates reference. The work has been prepared for sheet-metal workers in general, and not for any one class in particular. The tinner will find in it what he requires, without the necessity of studying the cornice problems. The cornice maker will find in it everything from a simple miter to the most complex problems, so arranged as to meet his requirements, without the necessity of going through portions in which he is not interested. The general student will find the entire subject presented in such a manner as will facilitate systematic study. The rapidity with which each edition has been exhausted, and the universally favorable comments it has called forth, prove that it fully meets the want it was intended to supply

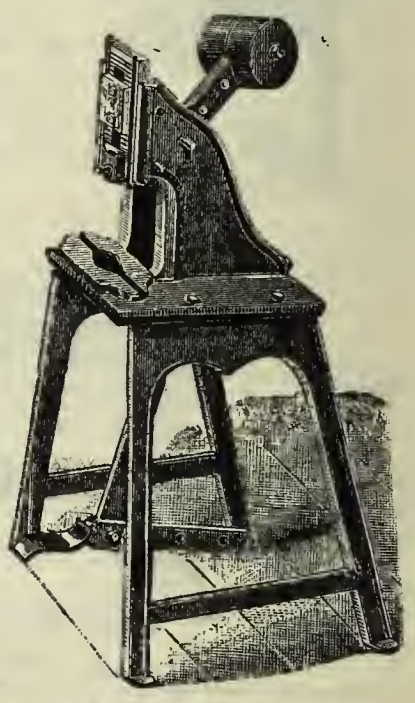
Second, for Quality of Work.
Third, for Simplicity of Construction and Ease in Operating it.

To those undertaking large contracts at close prices, in fact, *to any Roofer who appreciates saving of time and labor,* this machine is indispensable. Send for testimonials, &c., to

LYON, CONKLIN & CO.,



Importers Tin Plates and Metals,

ESTABLISHED 1860. BALTIMORE.

—OUR—

PENDULUM PRESSES

are suitable for a wide range of work. Grooved beds with sliding bolts for holding all sizes of dies. Perfectly fitted, balanced, and adjustable to light and heavy blows. A first-class machine in every respect.

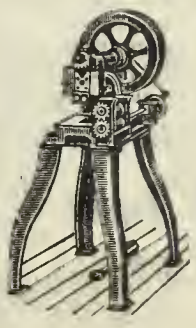
MANUFACTURED BY

G. A. Crosby & Co.,

176 & 178 So. Clinton St., CHICAGO, ILL., U. S. A.,

DESIGNERS AND BUILDERS OF

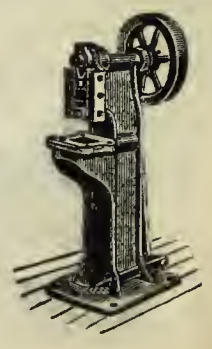
Power, Screw, Drop, Hand and Foot Presses, Squaring and Trimming Shears and Special Machinery for Can, Soap Makers', and other lines of goods, including Lanterns, Oil and Vapor Stoves, Locks, Hinges, Brass Goods and all Hardware Novelties.



Special Attention to Dies of every Description.

WORK GUARANTEED THE BEST.

Write for Prices and New Catalogue containing full line of Tinners' Tools.



☞ Agents for the Clark Perfection Kerosene Oil System for Heating Soldering Apparatus.

The Toledo Machine & Tool Co.,

MANUFACTURERS OF

Power Punching Presses, Drop Presses, Trimming Presses, Stamping Presses, Riveting Presses, Embossing Presses, Presses with Automatic Feeds, Chain Presses and Machines for working Bar and Sheet Metals. Complete outfits for Can Making.

Send for Catalogue now being Printed.

THE KEENE FOOT POWER

CORNICE BRAKE.

EASIEST TO OPERATE, STRONGEST AND BEST.

Sheet Metal Working Machinery of all Kinds.

GEO. C. KEENE & CO.,

Cincinnati, O.

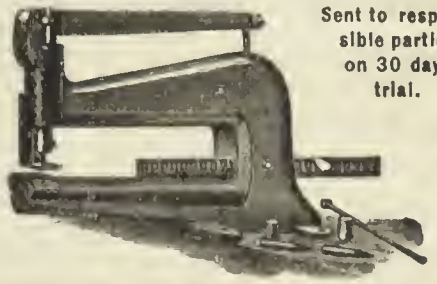
AGENTS:

Hibberd & Spinner,
9 Cliff St., New York

Holder & Herrick,
49 Broad St., Boston, Mass.

Ledwidge & Co.,
234 Lake St., Chicago, Ill.

PRESSES, DIES AND TOOLS



For Can and Tinware Manufacturers.

Dies for Cutting, Drawing & Stamping Tinware

Estimates given at sight of samples of drawing work.

Send Sample for Prices before ordering elsewhere.

DOVER MACHINE WKS., Dover, Del.

Sent to responsible parties on 30 days' trial.

CLOUGH'S IMPROVED FOOT PRESS,

For Sheet Metal Work. Punches to center of 86 in. sheet or 5 in. pipe 30 in. long. Handiest Press made. Dies and Punches furnished with every Press. Weight about 175 lbs. For Descriptive Circular and Price, address

R. M. CLOUGH, Tolland, Conn.

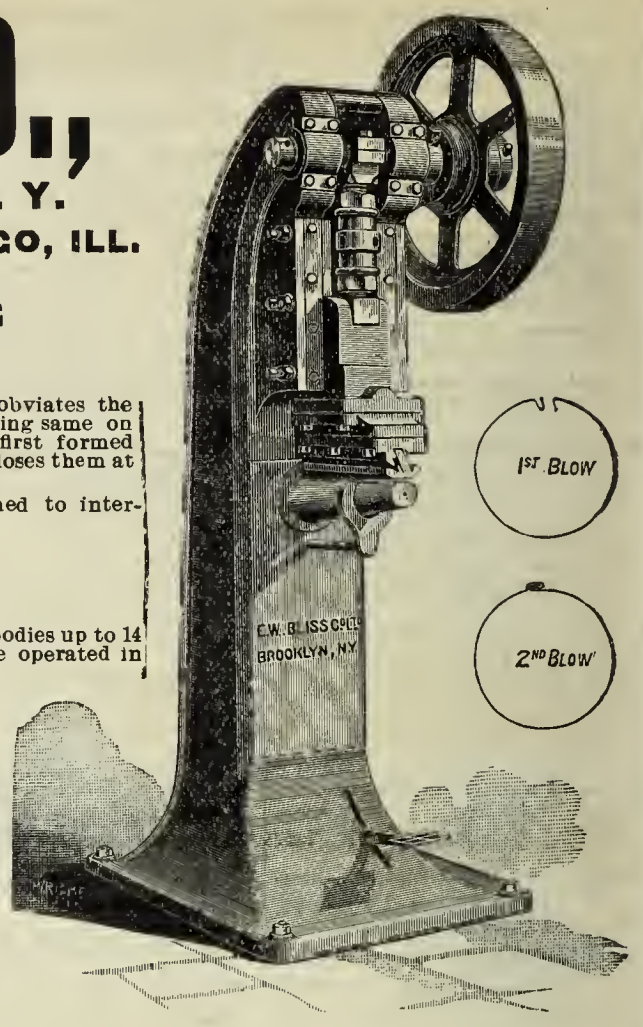
DUPLEX FOLDING AND SEAMING MACHINE.

THIS machine is designed to facilitate the manufacture of lock-seamed tinware. It obviates the necessity of using a bar-folder for forming the hooks on the body blank before rolling same on the forming machine. Its operation is exceedingly simple and reliable. The blank is first formed in the rolls, then placed in the machine, which forms the two hooks at one stroke and closes them at a second operation. The advantages obtained are:



First—That the blank is rolled in the flat, not having any hooks previously formed to interfere with the operation.

Second—That both edges are hooked at one blow

Third—That the hook forming and closing are done in one handling.

Fourth—That the seam is more uniform than if started in the bar-folder.

The horn can be arranged to throw the seam inside or outside. All sizes of bodies up to 14 inches long can be done on the one horn. These horns and forces are not adapted to be operated in presses having more than ½ inch throw.

MANUFACTURERS OF

PATENT PLANISHED SHEET IRON

PATENTED:

December 10th, 1878.	March 4th, 1884.	August 31st, 1886.
January 10th, 1882.	April 15th, 1884.	January 1st, 1889.
January 1st, 1884.	June 10th, 1884.	January 17th, 1893.
February 12th, 1884.	January 6th, 1885.	

Guaranteed fully equal, in all respects, to the IMPORTED RUSSIA IRON. Al WOOD'S SMOOTH FINISHED SHEET IRONS and SHEET STEEL of different qualities CLEANED AND FREE FROM DUST.

General Offices and Works, McKEESPORT, PA.
Branch Office, 111 Water St., Pittsburgh, Pa.

HAMILTON'S
BEST REDIPPED AMERICAN ROOFING TIN

is DIPPED AND REDIPPED by HAND, and is NOT coated b machines through ROLLS like some plates that are laude so highly by the makers, and the coating on Hamilton' Best Redipped is as heavy on the TOP half of the sheet a it is on the BOTTOM half. You have scales, test it. We ca furnish machine coated plates with 20 lbs. of coating t the box of I. C. 20 x 28 at $11.50 per box, fully equal t any of the so-called extra coated plates.

JOHN HAMILTON,

PITTSBURGH, PA.

McCLURE'S REDIPPED
ROOFING TIN.

AMERICAN MADE.

The durability of a Roofing Plate is in the amount and quality of Coating and not in the iron.

McCLURE'S REDIPPED

Is the finest and heaviest coated Roofing Plate made; guaranteed to contain **35 lbs. Coating** per 112 sheets.

To reduce the price of a Roofing Plate is simply to reduce the quality and amount of coating, thereby making a much inferior plate.

The high quality of **McClure's Redipped** will always be maintained as it is our desire to make the **finest and heaviest coated** Roofing Plate in the market regardless of any cost.

The best is always the cheapest.

The Best Galvanized Iron

t not to require specification, for a first-rate job of ult work can't be done without it, and a first rate job less with it than an honest attempt at a first-rate job out it.

ery first-rate metal-worker probably knows that lo is true to gauge and flat and bendable.

is of some little account that the top and bottom ts of a bundle are cushioned against the bands; and e delivered almost without blemish, just as the top and m sheets protect the inside sheets from the bands in r makes.

pollo Best Bloom is the trade-mark. It costs a little : in large quantities. This is the only reason that r galvanized iron is sold at all.

JENKINS' PACKING

Is all right, so say thousands of Engineers. We have positively refused many times to cheapen the quality to compete with other makers. It is better to-day than when first put on the market 20 years ago. It is cheaper than many other kinds because it does not weigh as much per yard. It is honestly made, and will do all that any other Packing will do and has advantages that no other has.

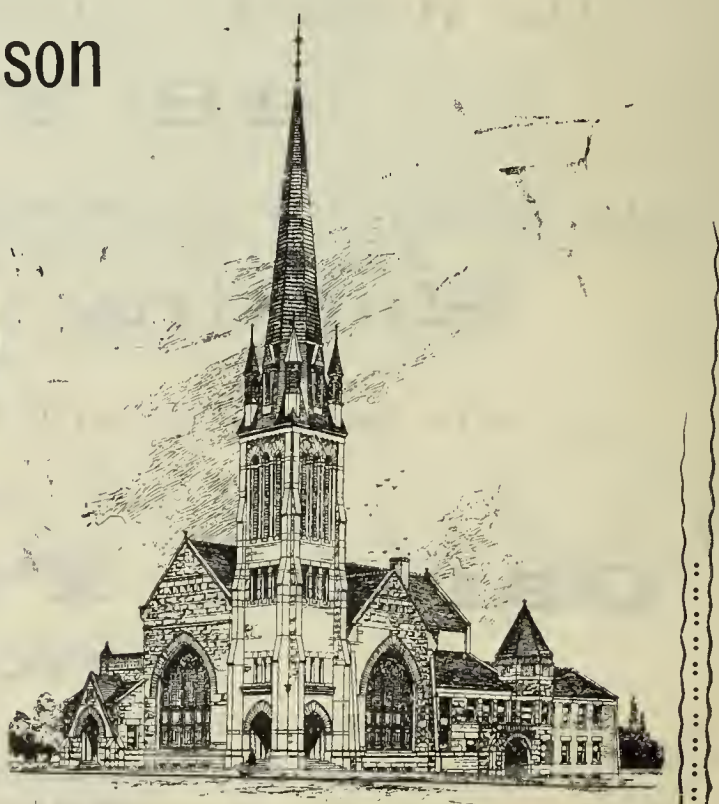
$150,000

Heated and Ventilated By

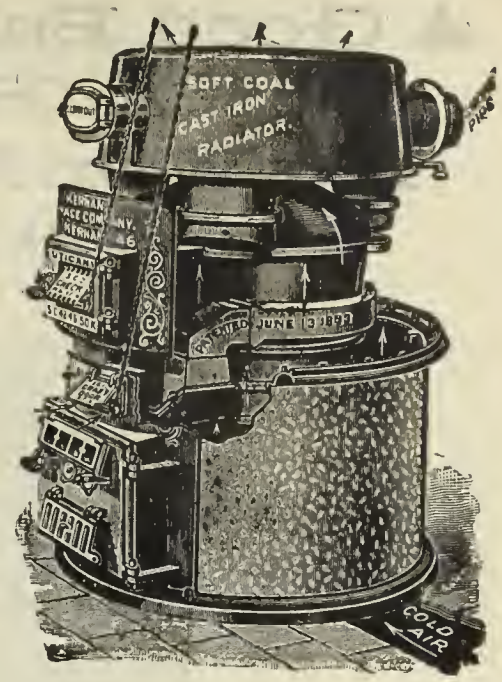
The Peck-Williamson system.



SEPTEMBER 19, 1894.

Gentlemen:—Pardon my delay in replying to your favor. It was only because I wanted to obtain the judgment of the particular officers of our church, and add their experience to mine about the workings of the furnaces in the building. After so inquiring, I am glad to be able to report that we are all much pleased with both the Heating and Ventilating apparatus furnished by your company and in use in our church. Everything works well, and we can heartily commend your system.

NEANDER M. WOODS,
Pastor Second Presbyterian Church, Memphis, Tenn.



(This church cost $150,000, and is one of the finest churches in the South.)

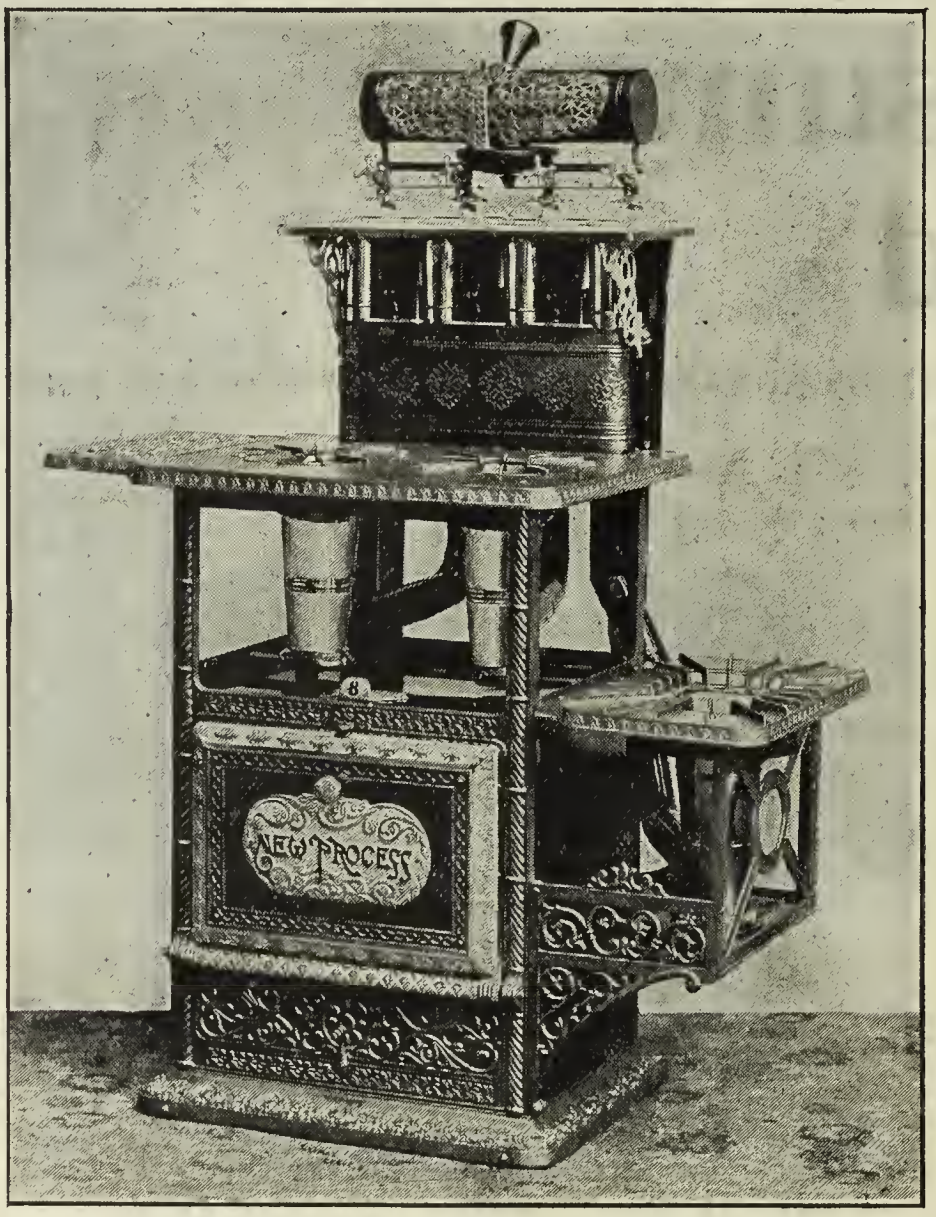
KERNAN Smoke Consumers Lead

In all the sections of the country where soft coal is used.

SECTIONAL VIEW,
showing the principle in the Kernan Smoke Consumer Furnace of a heated current of air entering the fire-pot, igniting with and consuming the smoke from soft coal.

Now is the time to secure the agency and thereby control the furnace trade of your locality. Do not waste time and money experimenting on new and untried constructions. The

Kernan Smoke Consumers



have been used for several years in all parts of the country and with every variety of soft coal, and are now conceded by the trade and public to be the only warm air furnace in which soft coal can be cleanly and economically used.

Send for Reference Catalogue of Soft Coal Furnaces.

IMPORTANT ANNOUNCEMENT.

To Our Patrons and the Trade Generally:

Our new Catalogue for 1895 will be ready for distribution within a few weeks. We take this means of announcing in advance of its publication that we have very carefully studied the requirements of the trade in every particular, and that our lines will be complete. We will place on the market specialties in entirely new goods that will commend themselves both by reason of popular prices and their many attractive and desirable features. In addition to our very popular Oilgas Cook Stoves, containing our improved 1895 Burners that are giving such perfect satisfaction, we have something entirely new in the line of special Lamp Stoves at special prices; also Sheet Steel Circular Burner Oil Cook Stoves. Write for further information and prices.

CENTRAL OILGAS STOVE COMPANY,

—Manufacturers of—

Gas, Oil and Oil Vaporizing Stoves and Fixtures. Over 200 different styles and sizes for Cooking and Heating purposes.

BOSTON, NEW YORK, CHICAGO, SAN FRANCISCO.

One of the many admirers of the L. & H. Process Stoves sends to us the following poem, which we give, as we believe it will be enjoyed by our friends and the trade at large:

"Sweet Marie"

Respectfully dedicated to the Vapor Stove Combination, with apologies to the author of Sweet Marie.

I've a secret to impart, Sweet Marie.
'Tis the same which made the Vapor Pool start, don't you see,
Every dealer in the land knows this secret, knows the brand (L. & H.)
Which causes the Pool to print their bluff, so grand! Holy gee!
When we took their case in hand, Sweet Marie.
There was music without a band—rogues they be;
All their souls are full of fear, full of worry and public leer,
And the dealers listen while we jeer, Sweet Marie.

CHORUS:
On the decline, Vapor Combine,
Vapor Combine, on the decline,
Not because their nerve is less—no, it's sublime,
For their patents are no good
Win their case they never could,
And they wonder how they stood all this time.

One morn the trade did awake, Sweet Marie,
To the blooming Vapor Pool fake, don't you see,
Now every dealer within this border to L. & H. sends his order,
For he'll not be intimidated, no, not he.
When the sunset tints the west, Sweet Marie,
The Vapor Pool will be laid to rest with glee,
And every member beneath the sky from the L. & H. mark will fly,
And if you mention "Vapor Pool" they're shy, Sweet Marie.

CHORUS:
On the decline, Vapor Combine,
Vapor Combine, on the decline,
Not because their nerve is less—no, it's sublime,
For their patents are no good,
Win their case they never could,
And they wonder how they stood all this time.

GARLAND STOVES AND RANGES
The World's Best

I has been said that in America TWO CLASSES of Stoves and Ranges are sold, viz :

"GARLANDS"

—AND—

OTHERS.

At the very head and front of the "Others" stands our new line of

"MICHIGAN" STOVES and RANGES,

Which are unquestionably the latest, handsomest and most artistically-designed Stoves and Ranges to be found upon the market at anything like the price at which they are sold.

They are made under our own supervision; by same workmen and out of the same material from which **"Garlands"** are made, and this fact of itself should be sufficient to cause them to be preferred by discriminating merchants and consumers, as against all other brands, excepting the invincible line of **"Garlands."**

MANUFACTURED BY

THE WARREN HARDWARE CO.

7 Market Street,

WARREN, OHIO.

Taplin, Rice & Company,

—Manufacturers.—

DICTATED BY P. **Akron, Ohio,** January 29, 1895.

BY THIS we beg to call the attention of the trade to the fact that during the current year we will be on the market with several new patterns of Steel Ranges and Heating Stoves, of superior construction, ornamentation and attractive form, the patterns of which are well under way and will soon be ready for the sand. The Climax Steel Range, which will be made in all the various conventional forms and styles, will be both as to construction and appearance second to none on the market. We will also have ready for the trade in due time a "Climax Air Blast" and "Climax Air Tight" heating stove in different sizes, the constructive features of which will be a radical departure from any pattern of stove ever offered, and we feel well assured they will wherever introduced take a leading position in the line of special heaters. Cuts and prices of these Ranges and Stoves will be mailed on application at an early date, and we are confident you will feel justified in deferring your order for supplies until samples or cuts of stoves named may reach you.

With grateful appreciation of former courteous favors shown us by the trade, we remain,

Very respectfully,

TAPLIN, RICE & CO.

Northern Queen

COAL RANGE,

SECOND EDITION.

KITCHEN BOILER CONNECTIONS.

A SELECTION OF

Practical Letters and Articles Relating to Water Backs and Range Boilers.

Compiled from THE METAL WORKER.

71 Illustrations, 8vo, 140 Pages, Cloth,

Price, $1.00

The book is well got up and the information well given. Those interested in works of this character will do well in buying it.—*The Plumber and Decorator.*

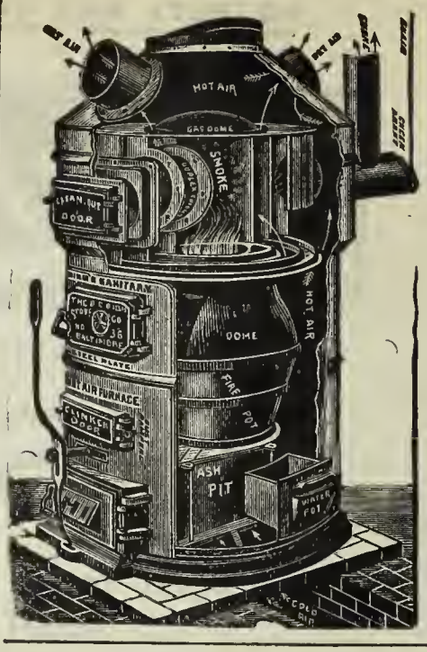
The Metal Worker produces in this volume a number of queries, with answers thereto, which have appeared in that paper. It will be seen that *any plumber who is troubled to make boilers work satisfactorily will here find his troubles alleviated. It contains numerous illustrations and throughout is highly practical from the standpoint of the plumber.* It contains a table of contents and an index.—*Scientific American.*

The publisher of this work is well known for his former successful efforts in the publication of useful and thoroughly practical books for metal workers and steam fitters The book before us is a model of its kind in judicious compilation, practical instruction, neat illustrations and general typographical appearance.—*The Master Steam Fitter.*

Can be considered an authority on the subject to which it relates.—*American Engineering.*

The book is a practical helper to every member of the plumbing trade, who, being alive to his own interests, should embrace this opportunity to obtain the valuable instruction in which the work abounds.—*New England Stove, Hardware and House Furnisher.*

A well bound, well printed, well illustrated and well edited book. . . The special field of this work is very thoroughly covered. . . Abounding in rare technical information of a practical character. *American Artisan.*



Nearly every problem is illustrated fully and this interesting question of water back connections will be found to be quite fully treated in the volume.—*Domestic Engineering.*

Both interesting and instructive to our trade. It shows how mistakes are apt to arise and how they may be overcome —*Plumbers' Trade Journal.*

VICTOR WARM AIR FURNACE

THE DOME OR COMBUSTION CHAMBER HAS A CAST IRON TOP AND BOTTOM; COLD AIR FLUES INSIDE.

DOUBLE RADIATOR BELOW THE DOME; SECTIONAL FIRE POTS; STAR GRATE.

IT IS A GREAT ECONOMIZER OF FUEL.

IT IS A LOW FURNACE.

ELMIRA, N. Y., January 15, 1895.

Gentlemen: I am pleased to have the privilege to testify as to the merits of your Victor Warm Air Furnace. This is the second season I have used it, and it gives perfect satisfaction in every respect. It Heats 4 large rooms down stairs and 3 sleeping rooms up stairs, and my monthly average of coal consumed is only one ton; I used 4 stoves to warm the same apartments before, with the average of two tons per month. Your great advantage over other Furnaces is your Base Burner Attachment that economizes all of the heat so that none escapes to the chimney. I am willing to speak a good word for the Victor at any time. Yours truly, R. N. PARMENTER. 118 West Water St., Elmira, N. Y.

Spiral Hot Water Generator.

(PATENTED.)

For General Heating Purposes, but Especially Adapted to House Heating.

COMMENDATORY POINTS:

Simple construction. Practically composed of two sections, consequently few joints and nothing to give out.
Large heating surfaces.
Products of combustion fully utilized.
Instantaneous generation of hot water.
Free and easy circulation.
Easily cleaned fire surfaces.
Hot water may be drawn off at any point along the pipe circuit without materially affecting the heating service.
Grate conducive to economy in fuel.

Spiral Water Back Attachment for Kitchen Ranges.

Spiral Water Back Attachment for Kitchen Ranges.

By utilizing waste heat, this water back extends the capacity of a kitchen boiler, and makes it a valuable heating auxiliary, especially in spring and fall, when the regular heating apparatus is too powerful.

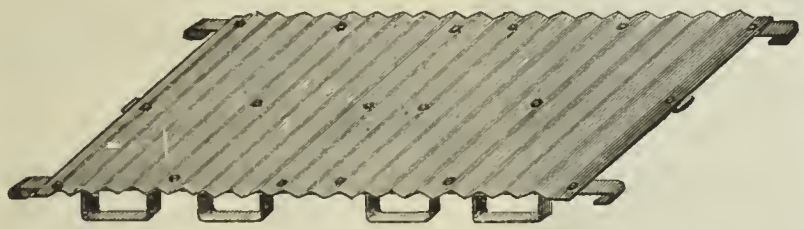
Patent Applied For.

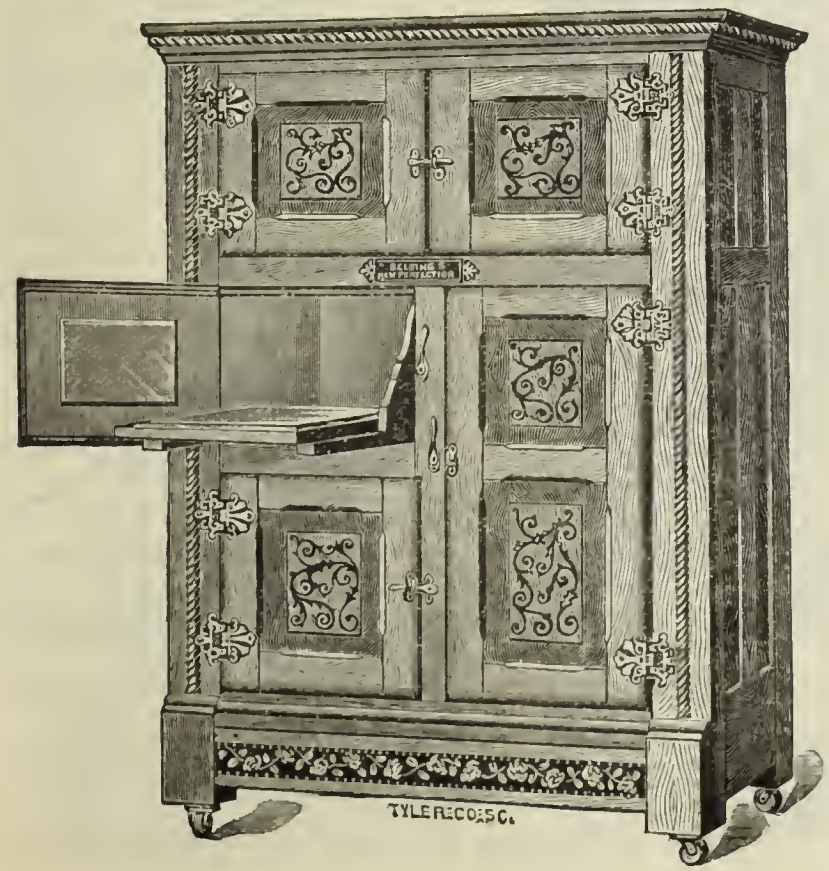
OUR NEW AUTOMATIC COLD AIR DAMPER ATTACHMENTS.



This cut shows a section of our Refrigerator with the New Automatic Cold Air Damper closed.

A—Represents Metal Ice Rack.
B—Bottom of Ice Compartment.
D—The **New Automatic Cold Air Damper.**
E—Door of Provision Chamber.

When the door of the Provision Chamber is opened the Cold Air Damper *immediately* closes the opening through which the cold air drops, thereby *instantly stopping the circulation* in the Refrigerator. Then, as the cold air in the Ice Compartment *cannot escape*, it is impossible for warm air to enter it through the flues in the sides of the Refrigerator; therefore, while the door of the Provision Chamber is open *no ice is wasted, no cold air escapes* and *no warm air enters* the Ice Compartment or *comes in contact with the ice.*



Thus it is clearly shown that this improvement is a *practical* one and makes our Refrigerators *consume less ice* than any that are now on the market.

OUR NEW DRIP CUP ATTACHMENT.

SOLID METAL ICE RACK.

No wood cleats to get water soaked and tainted.

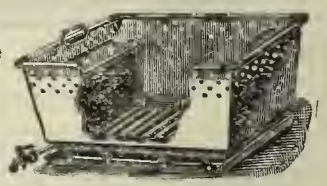
The Gurney Patent Refrigerator

is the BEST SELLER, gives the BEST SATISFACTION and PROFIT to the dealer of any refrigerator on the market BECAUSE—It has special FEATURES, "TALKING POINTS," SELLING POINTS, not found in other refrigerators.

1. By the use of a ***Removable Galvanized Ice Compartment*** the ***"Gurney"*** can be cleaned. This feature alone assures its sale.



2. Under the ***"Gurney"*** principles of construction the ***lowest*** average temperature is reached with the ***greatest economy of ice,*** as fully explained in our catalogue.

3. In the ***"Gurney"*** the ice does not come in contact with the zinc side walls, thus preventing condensation or "sweating" on the inside linings, an important feature of cleanliness and durability.

4. It is packed with Mineral Wool (the best non-conductor known).

5. It has the freest circulation and dryest air, there being a large space around the four side walls of the ice compartment, thus giving about six times the condensing surface of any refrigerator.

6. In style and finish it leads all competitors.

THE

Bowen Manufacturing Co.,

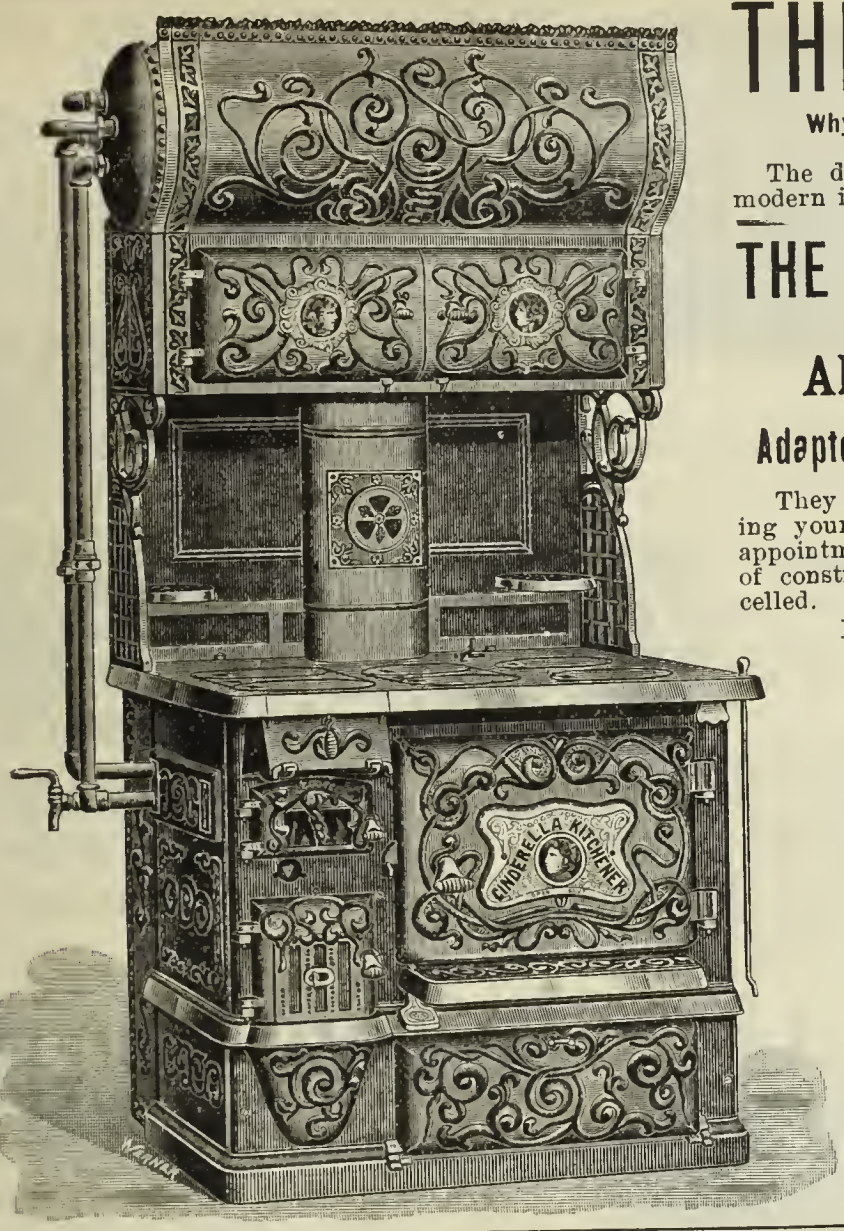
FOND DU LAC, WIS.

WHY IS IT

that the same dealers who sold the **Boomer Furnace** five years ago are still continuing its sale?

DID YOU EVER STOP TO THINK

that one or two years' experience with a poorly constructed light furnace always creates a demand for a furnace that has proven to be the best in the full sense of the word?



IF YOU WANT TO MAKE MONEY

buy the Improved Boomer Furnace, set it up right, please your customer, and you have the key to your future success.

REMEMBER

that a Boomer Fire Pot has never been known to crack or burn out. That it has the simplest and most effective Gas and Smoke Burner. Guaranteed the heaviest Furnace made. 84-page catalogue sent free to all responsible dealers.

HESS, SNYDER & CO., MAKERS. Massillon, Ohio.

THERE IS A REASON

Why some dealers are more successful than others.

The dealer who studies the wants of his trade, adopts modern ideas, is the successful man of to-day.

THE CINDERELLA KITCHENERS

ARE AN ENTIRELY NEW LINE OF

ALL CAST IRON RANGES,

Adapted for burning Hard or Soft Coal or Wood.

They are made in a variety of styles, with a view of meeting your local requirements. They are complete in every appointment, and are "up-to-date" goods that for excellence of construction and beauty of design they cannot be excelled.

Made in the following sizes:

No. 716,	Oven 16 x 16,	10½	inches high.
718,	18 x 18,	11½	"
818,	18 x 18,	11½	"
719,	18 x 20,	12½	"
819,	18 x 20,	12½	"
821,	20 x 22,	13½	"
921,	20 x 22,	13½	"

If you are interested write for prices.

We are makers of a complete line of Stoves and Ranges under the trade-mark of

"CINDERELLA."

We would be pleased to send our catalogue upon application.

The Weathered Hot Water Heater.

MANUFACTURED BY

THOS. W. WEATHERED'S SONS,

139, 141 and 143 CENTRE STREET, - - NEW YORK.

ESTABLISHED 1859. INCORPORATED 1893.

For Heating Dwellings, Greenhouses, Churches, Public Buildings, &c.,

By Hot Water Circulation Only.

OVER 6,000 IN USE.

Guaranteed to be more economical, quicker in circulation and more durable than any heater in the market. Hundreds are in use and doing good service that were put in 25 years ago. Send for our illustrated catalogue, **"Health and Comfort in the Home Circle."**

THE METAL WORKER ESSAYS

—ON—

HOUSE HEATING

—BY—

STEAM, HOT WATER AND HOT AIR

With Introduction and Tabular Comparisons.

Second edition, revised. To which has been added a selection from the Letters of Criticism on the Essays as originally published in THE METAL WORKER and a chapter on Proportioning Radiating Surfaces.

"The various subjects treated on are indicated by marginal sub-headings for reference purposes, and the illustrations, computations, &c., are plain and easy of understanding. The book may truthfully be said to be a careful compilation of the best ideas of those best qualified to speak on the subjects treated of, and to form as a whole the very latest and most valuable literature on a topic which is becoming more and more recognized as being of the first importance in the building and furnishing of healthful homes."—*The Building Trades Journal.*

"It constitutes one of the most valuable works on the subject of house heating hitherto published. It is a terse compendium of practical knowledge of all that is most useful on the subject, wholly ignoring an enormous amount of useless speculation upon the subject comprised in numerous volumes and the current literature of the day—written by persons who adopt theories and vainly search for facts to sustain them—not worth the reading. *Per contra*, the work before us is alike commendable to major-domos who would be well informed on the subject, and to engineers of heating and ventilation, who cannot afford to do without it."—*The Sanatarian.*

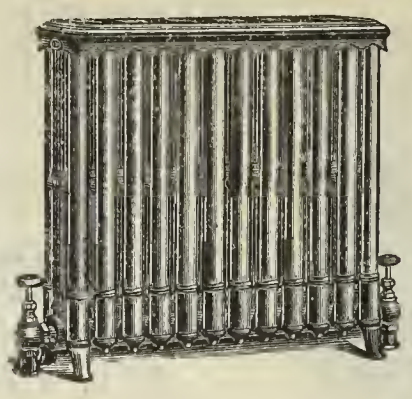
"There are fifteen essays in all, and every one of them is well worth the careful consideration of those interested in this most important subject. . . . The work is undoubtedly one of the most practical and highly valuable ever given to the public on the subject of house heating, and so thoroughly contrasts the different systems considered as to leave the subject almost, if not completely, exhausted. We commend it to the kindly consideration of all of our readers who desire the most practical views on the subject of which it treats."—*The Age of Steel.*

"Practical men have contributed of their knowledge in such a way and in such a form as to make the subject interesting as well as highly instructive, and with copious tables and diagrams showing the various methods of piping, etc., the work is unlike any book published. The book treats the subject in a common-sense method and goes directly to the point without any theorizing. It is a valued work and worth the money it costs many times over. It should be read by all devotees of the systems advocated in its pages, as it deals with a subject that is becoming more and more important every year and one that demands the best thought and the highest skill of every workman."—*Register and Bulletin.*

"It is a practical book. It does not contain rules that depend for their integrity upon one set of conditions, and which may not suit any other condition. The book is for the student, and when studied it will be found surprising how much information it contains that may not appear by a superficial glance or hasty examination."—*Boston Journal of Commerce.*

The work is handsomely presented in a volume of 288 pages in the form of a handy reference book, with many illustrations, showing the several ideas and methods of heating, ventilation and economical arrangement of pipes and radiators, &c. The very complete specifications of materials which accompany several of the essays give a value to the work that will be understood and appreciated by the architect and builder who aim for excellence in this branch of house building."—*The National Builder.*

JAMES SQUIRE, *Youngstown, Ohio.*—"If we had only had the information contained in this volume in earlier life, we could now have dollars where we only have buttons."



407 pages, 7 x 9½ inches. Handsomely bound in cloth. One volume.

DEALERS!

All Weak Points About Vapor Stoves

are not called to your attention by unscrupulous manufacturers or their salesmen. They often palm off imperfect and faulty stoves as perfect, and jolly you into the belief that you have struck a bargain.

But when summer comes and truth comes to light, as it invariably does in the vapor stove business, vexation and disappointment come with it. Vexation, because you have been duped, disappointment, on account of the loss of a season's profit.

Better handle a *good line* at a fair profit than a *poor* line at a *bargain* profit. There is no such thing as a "bargain," especially in the vapor stove business. *Proof*—Review the past???

Better buy from a responsible manufacturer or his legitimate jobber, especially of one whose integrity is unquestioned, and one whose knowledge of the vapor stove business secures you an honest deal and prevents the imposition of fakes or shoddy goods. *There are a few of us left.*

Better buy a good line to be successful. A *bad* stove is a very poor purchase at *any* price.

Better look for Protection.

Protection in order to be of service to you must begin at home. See that this point is not overlooked when casting about for a line for 1895.

Better think this over.

The old adage reads, "Make Haste *Slowly*." This is a weighty proverb. The more so when you consider that the best versed manufacturers in the vapor stove industry are not offering any new inventions or innovations for the coming season.

Yours respectfully,

ART OF COPPERSMITHING.

A PRACTICAL TREATISE ON WORKING SHEET COPPER INTO ALL FORMS.

By JOHN FULLER, Sr.

Size, 10 x 6½ inches ; 327 pages ; 474 engravings. Price, $3.00.

THIS book is brought out to meet the needs of a body of sheet metal workers whose trade has never before been thoroughly described. The author has acquired proficiency in copper working through a long apprenticeship and many years of actual labor at the bench. The instruction he gives is, therefore, entirely practical and will be correspondingly valued by those who are in any way interested in coppersmithing. A special feature of the work is the illustrations, of which there are 474, and which add much not only to the interest but the value of the text, as they show the work in all stages of progress and illustrate all the appliances, patterns and tools. The work is divided into sections, each treating a separate topic, and is thoroughly indexed. The style of the writing is exceedingly simple, and the descriptions of work go into the smallest details.

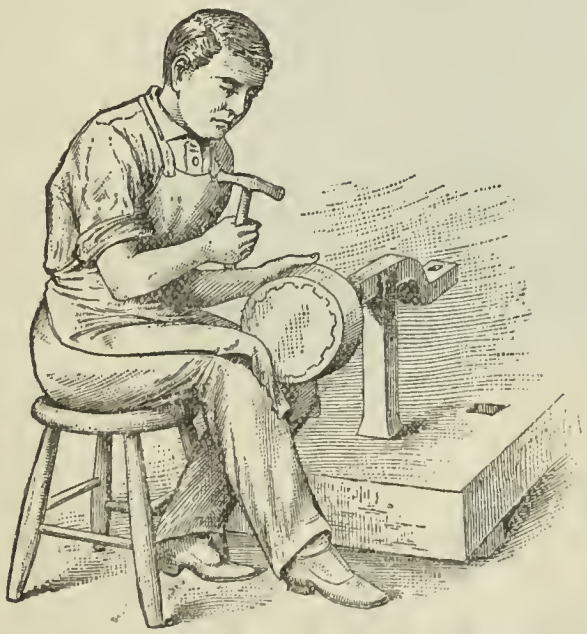

Fig. 107.—Planishing Tea-Kettle Side.

CONTENTS:

Historical Sketch of Copper ; Braziers' Art, or Light Coppersmithing ; First Year's Experience ; Repairing and Tinning ; The Boy's Second Year ; Making Washing Coppers ; Making Small Brewing Coppers ; Table of Dimensions and Capacity ; Making Hand Bowls ; Making Frying Pans ; Making Closet Pans ; Making Water Balls ; Mounting for Copper Goods ; Glue Pots and Tea-Kettles ; Oval Tea-Kettles ; Beer Mullers ; Funnels ; Coffee Pots ; Saucepans and Pudding Pots ; Stewpans ; Stock Pots ; Fish Kettles ; Brazing Pans ; Tea Boilers ; Warming Pans ; Preserving Pans ; Dripping Pans ; Coal Scoops and Coal Hods ; Making Coal Scoops ; Planishing and Smoothing ; Cranes or Syphons ; Pumps ; Appliances of Railway and Marine Coppersmiths ; Making Copper Pipe ; Piecing and Joining Pipes ; The Fire Pots ; Fire Pot Set for Brazing Joint ; Soft Soldering Large Joints ; Taking Templates ; Filling and Bending ; Making Bends ; Template Boards ; Patching Pipes ; Outlets ; Expansion Joints ; Tee Pieces ; Three-way Pieces ; Cross or Four-way Pieces ; Saddle Fire ; Marine Work ; View of Maudsley, Sons & Field's Shop ; Making Large Bends ; Making Double Bends ; Brazing on Flanges ; Short Bends ; Air Pipes for Ships ; Making Hollow Spheres ; Brazing Sheet Brass ; Locomotive Brass Work ; Brass Dome Covers ; Heavy Pipes for Breweries ; Brewing Coppers or Kettles ; Dome Coppers ; Dome and Pan Coppers ; Tallow Coppers ; Dyers' Coppers ; Sugar Tieches ; Stills.

Chimneys.

The influence of the chimney on the heating apparatus is well understood by the larger dealers and engineers. In too many cases the smaller heating man not only does not understand this, but is unable oftentimes, when he does, to procure a proper chimney, as his recommendation is looked upon as a desire to secure additional profit through the erection of a chimney. Chimneys have always been more or less puzzling in their capacity, and a flue of given dimensions under some circumstances has demonstrated a much greater draft ability than flues of larger dimensions under seemingly similar conditions. If a large hot air furnace is connected with a weak flue the fire, instead of being bright and glowing with intense heat, will lie comparatively dead, and the inexperienced person in endeavoring to secure the full power of the furnace will fail, even though more fuel is consumed than would be needed to secure the highest efficiency of the furnace with a flue of strong draft. It is often the case where a small apparatus which has rendered excellent service is replaced by a larger apparatus, from which better service is expected, that it fails to give satisfaction or do as good work because of the incapacity of the chimney to work it at its best efficiency. This trouble is not confined to the furnace business alone, but the makers of steam and hot water heating boilers have found in a number of cases much dissatisfaction to result from poor draft where the boiler, which had ample capacity and which had been piped carefully in accordance with good practice and ample radiation, had been properly placed. Expert investigation as to the cause of the trouble invariably resulted in finding that the chimney had too small capacity. This trouble is no small one to confront in the heating of old houses, and oftentimes the use of one apparatus has to give way to two of smaller dimension, in order that the chimneys which are in the building may be used and satisfaction secured. In the erection of new buildings the owner is often surprised, as well as the architect, after they have decided on a steam or water heating plant, to find the heating contractor demand a flue much larger than has been calculated for in the building for use in connection with his apparatus. Many dealers would save themselves an immense amount of worry and expense if the capacity of the chimney was well looked into previous to contracting for and installing a heating plant where a large apparatus is to be used.

The Drift Cityward.

A business man of New York, well known for his active interest in the younger men of the laboring classes, and whose personal acquaintance with the condition of the city's poor is both wide and sympathetic, was lately lamenting the growing tide of unskilled labor which sweeps into this city every year from the country districts. Did they but realize it, most of the country boys and young men who add themselves to the population of New York City from month to month could, he argued, secure a far better position for themselves in the smaller towns, where the labor market is usually not overstocked. They foolishly elect, however, to go to the large centers of population, where the struggle for existence is always of the most stringent and bitter character. This fact has been particularly noticeable during the past year or two, when times have been unusually hard. Not only young persons, but older people, out of work and perhaps in want, start away from the small towns and country districts with the idea of finding a wider opportunity to better their condition in New York or some other great city. This class of labor has been arriving in shoals during the recent period of depression, recruiting the already unwieldy army of unemployed in most of the greater cities. No graver mistake could be made. As a rule, small towns and villages have less excessive poverty to relieve than the great centers of population, in proportion to their resources. Able bodied single men, especially, should make their way to the country rather than to the cities. Many farmers would be glad to give one or two men, at least, a chance to earn their board and lodging by work in clearing up fields or making improvements in farm buildings, &c. This provision would be, for a while at any rate, far preferable to tramping the city streets day after day in a hopeless search for work, half starving meanwhile.

Heedlessness.

It does seem as though nothing was more aggravating in boy or man than the spirit of heedlessness. Once yielded to it becomes characteristic of the individual, and it is displayed in every act. It renders him useless in almost every position in which he may be employed, and is generally a pretty good indication that his mind is not upon his work. It results in a continued series of errors and disasters, of little blunders and unbounded waste. The person who is dominated by this influence guesses rather than takes the time to figure, is forever cutting off the sheet too short or else wastefully too long, is habitually unsystematic, never knows where things are, and never puts them back in their places, and is forever leaving things almost done when they might just as well have been completed. The cure for all this is hard to effect. Slovenly methods cannot be at once replaced by systematic habits, but the process may be gradual where there is a will to turn from heedlessness to carefulness as a characteristic of one's life. It must be by a careful scrutiny of each act, by thoughtfulness at all times and a never-forgotten determination to do all things as well as it is possible to do them. Such habits are sure to appeal to an employer, and although sometimes long in coming, the conscientious employee seldom fails to receive the reward that he deserves. At all events, it should mean much to him that he has tried to do the best that he can.

According to the New York State Commissioner of Labor, the introduction of typesetting machines has reduced the number of employees in printing offices from 20 to 60 per cent. If a recent announcement of the Paris *Figaro* is to be relied on, the printing trade is on the eve of a revolution which is likely to still further cut down the number of compositors enormously. The medium is a typesetting machine invented by Père Calendoni, a Sicilian monk, which, it is claimed, will compose 50,000 letters per hour. The difference in speed, compared with existing machines, lies in the fact that instead of each letter being made to fall separately into the composing stick, entire words can be composed in a moment by the simultaneous application of the fingers of both hands. M. Mazereau of the *Figaro* asserts that he has himself manipulated the instrument with complete success.

THE LETTER BOX.

A Question in Furnace Construction.

From CONTENTION, *Canada.* — We would be much pleased if *The Metal Worker* would kindly submit the following in the Letter Box for discussion by its expert readers. We make a coal furnace with a steel dome having two descending and one ascending steel flues, separated about 2 inches from the dome. These flues lead into a steel radiator surrounding the fire pot, leaving a space of about 3 inches between it and the pot. The distance from the outside of the radiator to the casing is about 1 inch. The question is whether more heating power would be obtained by having the radiator cast on to the ash pit, leaving 4 or 5 inches on the outside of it between it and the casing. The contention is whether more heat would be obtained by having all of the space on the outside of the radiator or having the air ascend on both sides of the radiator as first indicated.

Will It Work?

From B. M. C., *Hoboken, N. J.*—Replying to your correspondent "F. L. M.," Roseville, N. J., in *The Metal Worker* February 16, other things being equal, the location of the radiator is immaterial, but the heat derived will vary according to the quantity of water drawn from the boiler for household purposes. More satisfactory results would probably be obtained by having the radiator supplied from a small supplementary horizontal boiler above the range, having separate connections to an independent or secondary water back, and supplied automatically from an overhead tank. We know of a three-story brick house in this city heated throughout from the kitchen range on a somewhat similar plan.

Thawing Frozen Street Pipes.

From A. M. K., *Lititz, Pa.*— Will *The Metal Worker* describe some way to open up a frozen supply pipe which is under the street without digging it up?

Answer.—A common practice is to use a small sheet metal steam boiler, which may be placed on a charcoal furnace or a gasoline fire pot. The boiler is provided with cocks to show the water line, a funnel at the top to fill, a hose cock to which a hose may be attached, and, most important, a safety valve that will blow off freely at a low pressure, not over 5 pounds. The hose should be of good rubber, several feet long for convenience, and attached to ¼ inch block tin pipe wound in a coil so that it can be unrolled as used. Whether the pipe frozen is in the ground or covered with wood work, an opening must be made so the coil can be inserted. In the case mentioned there is probably a stop cock on the pipe in the cellar. The pipe should be cut off on the house side of the stop and the stop opened. On inserting the tin pipe it should be pushed in until ice is struck, then by turning on the steam the process of thawing without digging up the street is accomplished. When the water begins to run the steam pipe is withdrawn and the stop cock closed until the pipe is repaired. Some plumbers put a brass union in at the severed point, so that provision is made for thawing in future if necessary. If the pipe to be thawed has many turns in it the rubber hose can sometimes be made to pass them, but if it will not other openings in the pipe must be made. In *The Metal Worker* of February 18 and 25 and July 1, 1893, are letters on this subject with illustrations.

An Old Stove.

From B. L. F., *Lawrenceville, Pa.*—I am very anxious to learn when a very old stove which I possess was made. The name on it is:

"The Signe of the Anvil and Sledge. Made by John Spencer & Co., Albany, N. Y."

It is of the shape and about the size of an old fashioned fire place for wood, and the old lady from whom I secured it claims that it was used in either the first Methodist or Presbyterian Church in New York City.

Mechanical Telephone.

From SUBSCRIBER, *Paris, Ill.*—Will *The Metal Worker* give me a little information regarding a mechanical telephone? I have a Regina music box, and wish to convey the sound from the second story to my shop below. I bought a toy drum, cut it in two parts, and used them for diaphragms. They were secured in position by means of iron straps, and connected with a wire, there being one turn in the wire where it passed through the floor. As this arrangement did not operate, I placed an 8-inch pipe so as connect the music box with upper diaphragm, with no better success. I then used a waxed linen thread in place of the wire, and this did not operate. Does the turn in the wire stop the sound, or would it be better to have larger drums? Would an electric telephone work better? What is the cost of same, and where can they be obtained?

Answer.—To have a mechanical telephone operate properly there should be no short bends in the connecting wire, and this wire should not come in contact with any solid object. The bends should be made in a large curve, which can be done by fastening a number of soft cotton strings to the wire and securing these to small nails. As the drum heads are liable to become damp from the moisture in the air, and are difficult to keep tight, they are not so well adapted to the purpose as thin pieces of pine. Large drum heads would be no better in this respect. An electrical telephone might be used for the purpose of conveying sound from a music box, but it would be necessary to hold the receiver to the ear, as in ordinary use. Such telephones cost about $18, and can be procured from the Western Telephone Construction Company, 539–541 Monadnock Building, Chicago.

Objects to Waste and Cool Water.

From C. M., *New York.*—I am somewhat puzzled about a kitchen boiler which is set close to a range, but does not furnish hot water promptly to a sink, which is also close to the range. We have to let the water run a long while before the hot water comes, and as the boiler is supplied by a tank which is filled by a hand pump from the cistern the waste is a very serious objection. I think the water back is not large enough for the 40 gallon boiler, because the upper pipe from the water back is never so hot but what the hand can be placed on it. My customer did not want the pipes overhead, so we ran them from the boiler down to the cellar and across under the kitchen and up to the sink, then up to the bath room and wash bowls on the second floor. It is my opinion that better service would be secured if the pipes were overhead. The bottom of the boiler is 2½ feet above the floor and above the top of the range. How can the hot water flow be quickened without wasting so much water?

Answer.—The size of the stove not being given, it is difficult to form an opinion as to whether the water back would be of sufficient capacity to heat a 40-gallon boiler. It is quite probable that a much smaller boiler would give better results with the water back now in use. Another trouble is caused by the pipes running down into a cold cellar and being exposed. If the water is not specially hot and the water back of ample capacity, it is more than probable that the water lying in the pipe would be quite cold, and when the faucet over the sink is opened this water would have to run off before hot water could come. Wrapping this pipe with hair felt or some similar material to prevent its cooling will reduce the trouble. Where the waste of water is objectionable it is often advisable to use what is known as a circulating pipe—that is, a pipe of smaller diameter leading from the hot water pipe at the faucet back to the boiler and connecting with the pipe at the bottom of the boiler. Our correspondent is correct in assuming that less difficulty would be experienced if

the pipes were run across the ceiling of the warm kitchen; and in these times, when exposed plumbing work is becoming more general, there is little objection to a neat job of piping.

Coloring Brass.

From W. E. B., *Reading, Pa.*—Please inform me through the columns of *The Metal Worker* how I can produce an old copper finish on brass or bronze. I would like as simple a method as possible, one that any tinsmith can use.

Answer.—The article to be colored should be chemically clean so that the coloring solution is free to act on the exposed surface. While the article may appear to be clean, the surface may still be covered with a greasy film or oxide. This can be removed to a great extent by the use of polishing powders that are free from grease. The article is then to be dipped in a pickle composed of 1 quart each of water and sulphuric acid. Add to this 1 pint of nitric acid and 1 ounce of hydrochloric acid. The article is first dipped in the above mixture, rinsed in clean hot water, and at once placed in the coloring liquid. The coloring liquid is prepared as follows: Dissolve 1 ounce of hyposulphate of soda in 1 quart of pure water. Into this is to be stirred another solution made by dissolving 1 ounce of acetate of lead in 1 pint of water. When to be used the solution is heated in an earthenware vessel to a temperature of about 195° F., when the article to be colored is immersed The color obtained will depend upon the time the article is held in the solution, the colors being golden yellow, copper, carmine, dark red, blue and brown. A red and green coloring can be given to brass by substituting an equal weight of sulphuric acid for the acetate of lead.

Wants Hotter Water.

From PLUMBER, *Nassau, N. H.*—I would like a little assistance from the readers of *The Metal Worker*. I put in a job of plumbing lately and my customer finds fault with it, saying that on some days he cannot get any hot water with a new fire. The job is put up in the usual way, with the exception that the hot water pipe runs to the cellar and then up to the bathroom on the second floor. I have examined the pipe at the top of the boiler and the water front and found everything clear. A 35-gallon boiler is used. Some days the water is hot; other days it is only warm.

Note.—No doubt our readers can give this correspondent some assistance. In the mean time we would suggest that it is quite probable that the pipes being exposed in the cellar to a low temperature and making such a long run previous to reaching the bathroom the water is cold before it arrives at the faucet. It may be that a 35-gallon boiler is too large for the water back that is used in connection with it, or the fire required to do the work for the family is less than would be needed to heat so much water. The trouble may be overcome to some extent by wrapping the pipes to prevent the loss of heat while the water is in transit.

Is It a Good Investment?

From J. B., *New Jersey.*—I have suggested to one of my customers that he should use a circulating system in connection with his kitchen boiler so that he could get hot water in any of the fixtures in his system immediately on any of the faucets being opened. In this particular case the actual cost of labor, piping and material for insulating the piping will not exceed $25. My customer asked me why he should spend $25, when for a few minutes' time he can get just as hot water, and further explained that as the $25 would be a permanent investment and the money being worth 6 per cent., he would be out $1.50 per year for interest. I have explained that in waiting for the water to come hot from his faucets he brings more cold water into his boiler and water back to be heated, and consequently requires more coal for the kitchen range. He claims that the fire would have to be run anyway, and doubts if there would be any increase in the consumption of fuel. It is my opinion, however, that in the course of a year he would not only save enough coal to pay the interest, but something on the principal, and that in a term of years much less than 25 he would save enough coal to pay for the circulating pipe and then receive a dividend on the investment. I should be glad to hear the opinions of the readers of *The Metal Worker* on the subject.

Will It Circulate?

From T. W., *Paterson, N. J.*—In *The Metal Worker* of January 26 I notice the inquiry of "F. D." and his heating plant. There is some space above the top of his flow main, and I should advise that this flow main be run up as high as it is possible and have an air vent connected with the expansion tank, the expansion tank, of course, to be above the flow main. From this point the flow main should have a fall instead of a rise, as shown in his drawing to the heating coil. This will give him better chance for circulation. In order to get the cold water from the coil in the pit back into the heater, it will be necessary to have a sufficient hight of column of water back of the coil to let the weight of the water overcome the weight of the cold water in the coil. If he has sluggish circulation or his job fails to circulate altogether, he will know that the hight of the water column is not sufficient. Then it may be necessary for him to put the expansion tank on the floor above and to run a siphon up to it and drop down immediately alongside of the expansion tank to where it connects with the main that runs over to the first coil. Then no difficulty should be experienced in getting good circulation through the coil in the pit.

Gasoline Burner for Cook Stove or Range.

From C. D. FOWLER, *Berwick, Pa.*—Will some of the readers of *The Metal Worker* inform me through the columns of the Letter Box if they know of a gas burner intended for use in connection with a range or cook stove, which will burn gas made by a gasoline machine? I want to heat the range in the same way that coal would heat it, and am anxious to learn of the name of the manufacturer of the burner.

A Direct Hot Water Connection.

From D. & W., *Bellwood, Pa.*—I would like to get some information about making a direct connection from the water back in a stove to a sink. The water back will be connected with the boiler in the usual manner, but owing to the surrounding conditions it would be much more convenient to take a pipe from the water back direct to the sink than to take it from the top of the boiler to the sink. Would there be any danger in making such connection and what would be the objection to it?

Answer.—There would be no danger in a direct connection from the water back to the sink. The objection, however, would be that in all probability cold water would be drawn through this faucet after a small quantity of hot water had been secured. The water back receives its water supply from the bottom of the boiler and as soon as any hot water faucet is opened cold water enters the boiler to take its place. This cold water passes immediately to the water back, and if a direct connection were taken from the water back to the sink, the cold water would pass but slightly warmed through this pipe to the faucet.

Emanuel Samuel, vice-president of the Steel Bath Mfg. Company, Detroit, Mich., was accidentally killed in New York on the 3d inst., by falling down an air shaft in an apartment house where he was visiting. Mr. Samuel was a widower, 45 years of age, and had resided in Toronto, Canada, for 30 years. He was liberal in his charities, and recently donated $1000 to the new synagogue on Bond street. He was president of the Metellic Roofing Company, and a member of the well-known wholesale hardware firm of M. & L. Samuel, Benjamin & Co., Front street, Toronto.

The Metallic Cabinet Company, Cincinnati, Ohio, are about to publish a complete catalogue of the various styles of metal furniture that they manufacture. Advance pages show some of these specialties and illustrate the capability of sheet metal for this class of work. Cabinet files and cabinets of various sorts are shown. The advantages afforded by this material for various furniture purposes will be readily comprehended.

The method adopted in Antwerp for purifying the filthy water of the River Nethe is to pass it through revolving cylinders containing small pieces of iron, it having been ascertained that 15 pounds of metallic iron is sufficient to purify a million gallons of water. The water thus treated is said to be completely freed from germs, bacteria and other ojectionable matter. Chemists find that the contact with iron reduces the organic matter from 45 to 85 per cent., and albuminoid ammonia by from 50 to 90 per cent., and all free ammonia is removed.

PLUMBING and GAS FITTING.

Allentown, Pa., Plumbers.

Secretary August Leibold of the Allentown, Pa., Master Plumbers' Association sends *The Metal Worker* a copy of their constitution and by laws and a statement that they have affiliated with the National Association of Master Plumbers. The firms composing the association are:

John H. Birchall,
J. C. Bitterling,
A. P. Deiley,
Mattern & Seagreaves, (2)
J. T. Reichard,
Shafer & Willenbecher Bros., (3)
Evans, Seagreaves & Co., (3)
Kiernan & Whitesell, (2) Bethlehem, Pa.

The following are the officers and committees:

President, John H. Birchall.
Vice-president, J. A. Shafer.
Secretary, Aug. Leibold.
Treasurer, M. F. Seagreaves.
Sergeant-at-Arms: J. T. Reichard.

Executive Committee: John H. Birchall, J. A. Shafer, Aug. Leibold, M. F. Seagreaves, Peter Kiernan.

Sanitary Committee: Lewis Willenbecher, F. E. Whitesell, E. B. Evans.

Investigating Committee: J. C. Bitterling, M. F. Seagreaves, Wm. H. Mattern.

Auditing Committee: J. A. Shafer, Lewis Willenbecher, A. P. Deiley.

Apprenticeship Committee: M. F. Seagreaves, Peter Kiernan, J. A. Shafer.

Conference Committee: F. E. Whitesell, E. B. Evans, M. F. Seagreaves.

Rhode Island Master Plumbers.

The convention of the Rhode Island Master Plumbers' Association at Pawtucket, R. I., last week, elected the following officers:

Patrick Tierney of Providence, president.

E. G. Lee of Providence, P. J. Murphy of Newport, C. W. Talcott of Woonsocket, C. P. Brennan of Providence, and David G. Fales of Pawtucket, vice-presidents.

James Oppeshaw of Newport, treasurer.

J. C. Conroy of Providence, corresponding secretary.

W. M. Congdon, financial secretary.

T. E. Manney of Providence, recording secretary.

The proposed law was discussed at length, and a unanimous vote taken to give it support and insure Rhode Island the same sanitary protection by modern improvements that other States receive.

At 4 p.m. the delegates sat down to a banquet, and speeches followed by ex-National President Trainor of Baltimore, D. G. Finnerty of Boston, John F. Deedy of Worcester, Inspector of Plumbing J. G. Read of Pawtucket, J. R. Tully of Boston, and others.

THE PLUMBING AND TINNING FIRM of Behner & Norton of Hartford, Conn., says the New Haven *Record*, has been dissolved. The business will be continued by F. E. Behner at the old stand.

New Perfection Irrigating Pump.

The accompanying cuts represent an irrigating pump, put on the market by the St. Joseph Pump Company, St. Joseph, Mo. The device is shown in

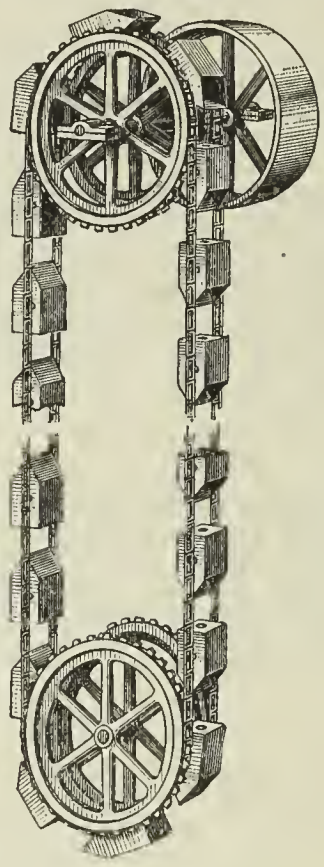

Fig. 1.—*New Perfection Irrigating Pump.*

Fig. 1, and an enlarged view of the bucket in Fig. 2, a portion being broken away to show the valve in the bottom. The bucket is made of galvanized iron, folded together by double locked seam, having a ball valve or air

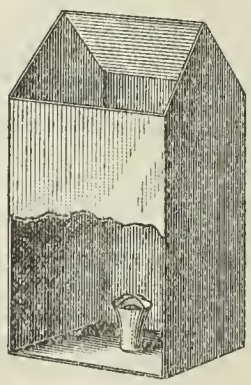

Fig. 2.—*Enlarged View of Pump Bucket.*

vacuum in the bottom to allow the air to escape as the cup fills with water, thus overcoming air resistance. As the cup passes over to empty, the valve or ball drops into a basket, which permits the air pressure to force the water, causing it to empty rapidly. It has been demonstrated, it is stated, that air resistance in a large volume of water is almost equal to the weight of the water itself, and the manufacturers refer to the pump saving almost one-half in power and machinery. It is claimed that, practically speaking, with the pump all that has to be overcome in the way of resistance is the actual weight of water, and that this is a feature peculiar to this pump only. When a pump is ordered, it is furnished as represented in Fig. 1, including the top gearing, babbitted boxes, sprocket wheels and driving pulley keyed on to the shafting; also with the chain and buckets and lower sprocket idlers keyed in position. The frame for the machine to rest on is designed to be constructed by the purchaser, after the plan of a common grindstone frame, to suit the lay of the ground. When hights of lifts are not given the manufacturers' quotation is based on a 20-foot rise to the top of the ground. The company state that the pump is adapted to the use of farmers, gardeners, stock and fruit raisers, and that it can be driven by horse, steam, windmill or motor power. It is further stated that the pump can be used in raising water from wells, rivers or canals, that it is especially adapted to use where a large volume of water is required, and that it is made with a capacity of from 50 to 1500 gallons per minute.

A Model Plumbing Establishment.

The building 212 Bank street, New London, Conn., occupied by L. Mallory has come out of the hands of carpenters and painters and the change in its appearance has been remarkable. Two large plate glass windows have been placed in the front, giving ample window display. The interior is hard wood finished throughout and has been fitted up to make the finest kind of a showroom for exhibiting Richmond steam and hot water heaters, elegant bathtubs, lavatories, siphon closets, and all their working connections, showing also the fine plumbing the firm are capable of.

In one window is shown a porcelain bath and a lavatory of light Tennessee marble with all faucets, trimmings, &c., silver plated. The window floor is covered with tiling and rugs and the effect is decidedly pleasing. In the other are shown Richmond heaters in two styles, painted white with gilt decorations and various kinds of ornamented radiators.

In the center of the store is a row of Richmond heaters. One is set in Philadelphia pressed brick, with a section left open showing the arrangement of the flues. On the north side is a row of siphon closets of modern design, with connections all made, showing their action with water. Another bath, steel clad and copper lined, is here shown and also an elegant lavatory with beveled plate mirror.

On the south side is set up a Jewett steel range with all the auxiliaries in working operation. Here are seen the plumbing connections to the copper boiler, the porcelain lined sink on one side and the convenient wash trays on the other. In the rear in one corner is

the business office neatly partitioned off, and further in the rear is the workshop, arranged with all the necessary appliances for promptly and skillfully turning out work.

The store is specially fitted up as a showroom, and everything is arranged just as it would look ready for use in a private residence.

Association News.

The Missouri Plumbers' Convention.

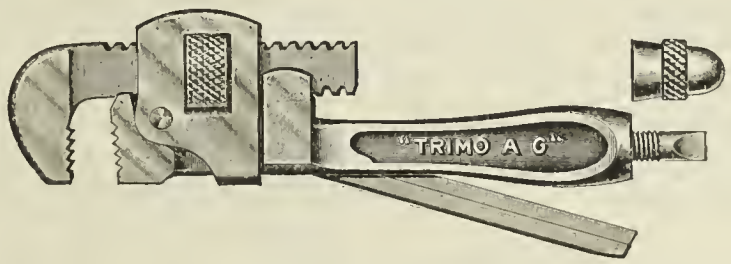
The Missouri State Association of Master Plumbers held its annual convention last week in the Elks' Hall, Hagan Building, St. Louis.

President L. B. Cross called the meeting to order at 10 o'clock a.m., appointing L. Marvin, R. T. Connell and Phil Kruez as a Committee on Credentials. John McDonnell of Kansas City, Ed. Byrne of St. Joseph, and John Mc Mahon of St. Louis were appointed as Auditing Committee, and T. T. Gray of Sedalia, Henry Goss of Kansas City, Harry Cooper of Springfield, and M. J. Ward of St. Louis as Committee on Resolutions. President Cross then addressed the meeting and congratulated the association on the good work already accomplished. The secretary reported 13 new members during the year, and the treasurer's report showed a balance of $1044.50. Initiation fees for individual members were increased from $2 to $5, and from $10 to $20 for firms.

A new plumbing law was advocated which provides for the inspection of plumbing in cities of 5000 inhabitants and over, and the appointment of a Board of Examiners, to consist of the health officer of the city, two master plumbers and two journeymen who have had at least 15 years' experience. The matter will be taken before the Legislature by a committee appointed by the association. Another committee of two will be appointed to canvass the State for new members. The election for officers for the ensuing year resulted as follows: L. B. Cross, Kansas City, president; Joseph W. Powers, St. Joseph, vice-president; John P. Kelleher, St. Louis, secretary, and Henry Goss, Kansas City, treasurer. The officers, with the addition of M. J. Ward and Harry Cooper, will act as the Executive Committee. Ed. J. Lonergan of St. Louis and Joseph W. Powers of St. Joseph were selected as delegates to represent the Missouri division at the Convention of the National Association, to be held at Philadelphia, June 11, 12 and 13.

St. Joseph was chosen for the next annual meeting, and the time was changed from the second week of February to the second week of April. After a vote of thanks to the local organization and to the press, the meeting adjourned *sine die*. In the evening the visitors were entertained at a banquet given in their honor by the local plumbers, and songs, recitations and speeches were listened to during the repast, which continued until a late hour.

THE Massachusetts State Association of Master Plumbers will hold its next quarterly meeting in New Bedford, Mass., the latter part of April, and at a recent meeting of the local Master Plumbers' Association the subject of the State association's meeting was considered.



THE Wisconsin plumbers' organization have had a copy of the New York plumbing law introduced in the Wisconsin Legislature and P. H. Ryan and W. S. Patterson appeared before the legislative committee in behalf of its passage, clearly stating its points, and made a favorable impression in its favor on the committee.

JOHN HICKMAN, Paterson, N. J., State vice-president of the National Association of Master Plumbers from New Jersey, was caught out in the recent blizzard and badly frozen. It is reported that he is recovering and is still able to make one of his effective speeches.

MASSACHUSSETTS, MISSOURI AND CONNECTICUT PLUMBERS were honored at their State conventions. National President John Mitchell was at Waterbury, Conn., ex-Presidents Daniel G. Finnerty and John Trainor were at Boston, Mass., and National Vice-President L. B. Cross presided at St Louis, Mo.

Trimo Gas Fitters' Wrench.

The Trimont Mfg. Company, Roxbury, Mass., are putting on the market a wrench for gas fitters' use, as shown herewith. The wrench is 6 inches in length, and has a gas tip cleaner which shuts into the handle, as a knife blade. The cleaner is released for use by unscrewing the knurled cap at the end of the handle. By unscrewing the cap entirely a screw driver is disclosed. The tool is referred to as a handy pocket wrench, and is furnished both polished and nickel plated.

Trimo Gas Fitters' Wrench.

TRAPS AND VENTS.

R. L. DODSON, who was a member of the firm of Whitney, Dodson & Co., in Albuquerque, N. M., has opened a plumbing establishment himself.

THE BOARD OF PLUMBERS of Watertown, N. Y., met last week and granted a certificate of competency to F. B. Wilson, who was credited with 97 points out of a possible 117. The following plumbers now hold certificates of registration: Hyde, Young & Hyde, A. Beffrey, McCrady & Sutton, Howard & Arthur, J. W. Spratt, Pfister & Morath, J. J. Hartigan, J. J. Bragger, M. Harbottle & Co., Huntington & Weeks, G. H. Mowe, A. J. Easton and L. A. Howard.

THE MATTER of plumbers taking out licenses and furnishing bonds was brought up by the City Council of La Porte, Ind. All plumbers are to be made to take out a license and furnish a bond for doing their work in accordance with the requirements of the city. There are said to be now practicing in the city several plumbers who have neither licenses nor have they furnished bonds.

"STEEL CLAD BATHS, TORONTO" appears in raised gilt letters on the front cover of a pretty pamphlet which is issued by the Toronto Steel Clad Bath & Metal Company, Limited, Toronto, Ontario, Steel Clad Baths being made in Toronto, New York, Detroit and London. This is the third season of the concern, and in a prefatory note to the catalogue they refer to the constantly increasing sales of their specialty and the indorsements it has received from sanitary engineers and architects. Ten different full page plates show their various styles of the Steel Clad Baths, while sufficient descriptive particulars are given to enable the reader to form a very clear estimate of its features. Toward the close of the pamphlet cuts are shown of bath fixtures, range boilers, soap cups, pantry sinks, &c. At the end is a list of references and a number of testimonial letters.

THE City Council of Gloucester, Mass., is considering a plumbing ordinance.

J. C. DEGNAN, Middletown, N. Y., is exhibiting a shower bath of his invention in his window.

AT THE MEETING of the Board of Plumbing Commissioners, Jacksonville, Fla., last week, the report of Plumbing Inspector Moran for the eight months from May to December 31, 1894, was received and shows that 442 plans have been submitted for his approval. Of these, 85 were for inspections in new buildings, 265 for the remodeling of plumbing in old buildings and 92 for sewer connections. There were 195 inspections of new plans and 590 of old plans made during the eight months, and $639.50 was collected in fees. There were at the first of the year eight licensed plumbing establishments in the city, according to the inspector's report.

E. A. CREEVEY has purchased the entire business of the late M. R. Leavenworth, Bridgeport, Conn., who was engaged in the plumbing, heating and stove business for so many years.

THE MONTHLY MEETING AND BANQUET of the Plumbers' Supply Association of New England was held at Young's Hotel. Boston, Mass., last week. Frank J. Knox presided.

F. & F. C. BOOTH, who succeeded a short time ago to the plumbing business of the late Alfred Hopkins on Middle street, Bridgeport, Conn., report a very satisfactory business going on at the present time. They are handling the Mahoney steam and hot water boilers.

PAT KANE'S plumbing establishment at Alton, Ill., was entered by burglars last week.

AT THE ACADEMY OF MEDICINE, 17 West Forty third street, New York, last week, ex-School Commissioner Charles C. Wehrum read a paper on "How can the Sanitary Conditions of the Public Schools be Improved?" He said that it would require $7,000,000 to put the public schools of the city in the condition they ought to be. The Board of

Education was represented by Assistant Superintendent of Schools Lee, who gave his opinion that it would take three times $7,000,000 to put the schools in the sanitary condition they should be in.

F. A. Curtiss of Curtiss & Pierpont, plumbers, New Haven, Conn., has bought a lot and will build a residence in the spring.

The preliminary report of the sub Committee on Baths and Lavatories of the Committee of Seventy, of New York, has just been completed. The committee finds that New York and other American cities are far behind those of Europe in the matter of public baths. The public lavatories in this city are in the bar rooms and, with a few exceptions in the parks, are nowhere else. The committee describes at some length the system employed in London, especially the underground lavatories, &c. It recommends the duplication of the conveniences in the parks and the enlargement of those already built; ample provision of conveniences for women; the opening of a sufficient number of underground water closets near the greatest points of travel; the provision of a sufficient number of surface water closets, and the placing of lavatory accommodations as far as possible in public buildings. The committee further recommends that a part of each of the baths and conveniences be free and in the remaining part a small fee be charged; that the places be in charge of paid attendants, and they be under the jurisdiction of the Health Department.

Catalogue No. 1, dated 1895, and issued by the Pfau Mfg. Company, 138–142 Hunt street, Cincinnati, Ohio, shows a very extended line of Peacock tanks and seats, and likewise notes several other sanitary specialties. The firm have during the past year increased their manufacturing facilities, having added several new departments, including nickel plating, brass casting and finishing and stamping. The trade-mark which they have adopted for their goods is the representation of a peacock. Alluding to the tanks and seats the manufacturers say that they use dowels in each joint, thus insuring great strength and durability. The closets include the Objay and Epay, and the closet tanks in all styles and finishes are illustrated. Among the new goods are the Palm Scroll and the Grecian Border high grade tanks, which are decorated by sunken designs. The Roman pattern high grade seat and tank is a new fluted design of simple but elegant appearance. The Grecian Groove seat and tank are also new constructions, as is likewise the Royal. Other more elaborate designs are the hand carved seats and tanks. At the close of the catalogue illustrations of the different tanks showing their construction and operation are presented.

Smith & Webster, 15 to 21 North Clinton street, Chicago, have secured the entresol floor of the Unity Building, 81 Dearborn street, which is to be fitted up as a showroom for their plumbing specialties. It is an ideal location for this class of business.

The plant now under erection by the Victor Mfg. Company, at Blairsville, Pa., is nearly completed. The new concern will make a full line of porcelain enamel baths and enameled sanitary ware, also enameled specialties of every description. Their plant will be a very complete one and will include pattern shop and foundry. The concern received 5 acres of ground and a cash bonus from the citizens of Blairsville in consideration of their locating the plant at that place.

S. P. Olcott, formerly with C. W. Woodford, Port Henry, N. Y., and J. S. Huestis, formerly with F. E. Huestis & Brother, Crown Point, N. Y., have purchased the hardware, plumbing and tinning business of F. Jansen of Fonda, N. Y. Mr. Huestis is a practical plumber and heating engineer, being a graduate of the New York Trade School, while Mr. Olcott is a practical hardwareman who has been in the business for several years. The capital of the concern is $9000.

The Alberene Stone Company, 219 Lake street, Chicago, are to place a number of their laundry tubs in the Marine Hospital, Lake View.

Proper Location for Gas Meters.

The following extracts are from a paper read by Samuel Abbott, Jr., at the convention of the National Association of Fire Engineers at Montreal :

Experience has demonstrated the fact that the maximum degree of heat from a fire first occurs at the highest point in a room (except in the immediate location of a fire). Such being the case, it would be necessary to so locate the meter as to insure a minimum degree of heat for a reasonable time, thereby allowing for the discovery of the fire and notification of the fire extinguishing forces before the heat had arrived at such temperature as to melt the lead connections to the supply and distributing pipes or the soldering used in the construction of the meter. Very few fires originate in the immediate vicinity of a window of a building. Those that do are discovered early and invariably easily extinguished.

Taking the above experience into consideration, the uudersigned respectfully recommend that the proper location for gas meters in buildings, especially those used for manufacturing or storage purposes, should be at a point where the liabilities of the degree of heat in case of a fire should be at the minimum (which is usually near the floor of a room).

The connections between the supply and distributing pipes of the meter should be of iron, the meters where the soldered joints come to be inclosed in a sheet or galvanized iron hood sufficiently large to allow an air space. The hood would prevent interference with the meter and protect it from the direct heat of the flames.

New buildings should be piped in such a manner as to bring the main supply pipe directly perpendicular from where it enters the building and within easy reach of a window, the piping in the various stories diverging from the main pipe; where more than one meter is used, its location should be as previously recommended.

A shut off cock should be located in the supply pipe, either in the sidewalk or within accessible distance from the cellar window, the glass of which should be of such color as would make it distinctive and noticeable.

The subject of this topic not only is an important factor in a fire in its incipient stages, but is responsible for causing what would otherwise be incipient fires, conflagrations, and also many fires causing the use of large quantities of water that otherwise could be avoided. Often has it been the experience of many of us, where the lead connections of the supply and distributing pipes to the meter, or the pipe itself, becomes melted or disconnected, thereby allowing a fierce flow of gas flame, that invariably cannot be overcome except by the shutting off of the gas.

A Woman Plumber.

Woman ! woman ! that delightful creature so indispensable to man and equal to all of the emergencies made by his weaknesses, has shown that even the mysteries of the plumber's art can be included in her sphere and successfully solved when she goes to work.

In describing her experience, she said: "When sister came down to breakfast she said the water would not run out of the bathtub. I had to go out that day, and in my absence more water was run into the tub with the hope that the increased quantity would force itself out. Father had been consulted, but he had looked at it and said he didn't know what to do, and the water was still in the tub. I told my sister to send for a plumber, for I had another engagement the next day, but she was busy, and as the water had gone a sixteenth of a yard she thought it would all go in time. The next morning I concluded I would know how the 'ruffles were put on' that plumbing system, so I dressed for the work and took up the study of it. I took up the carpet, for I knew there must be some way to get at the pipes, and I found a board that was screwed down. I thought that was unusual, as all of the other boards were nailed, so I took it up to see what was under it. I got a screwdriver and took up the board and found that two other boards came up with it, leaving quite a good sized hole, so I could see under the bathtub. There I saw a short pipe coming down into a sort of a swelling and then running off somewhere, for I could not see the end. I felt all around the pipe and found a little cap with two prongs on it that I pried against with the screwdriver and it came loose so I could unscrew it. The smell almost made me sick, but I fished in there with a stick and got out a horribly nasty mess of lint, string and soap that nearly made me faint. I stuck to it, though, and pretty soon the water came with a rush, and I had to sit near that disagreeable mass with my hand over the hole till all the water ran off. Then I found the inside washed out quite clean, so I screwed on the little cap, got rid of the filthy stuff and put down the board and carpet without half as much fuss as a man would have made, and left everything perfectly clean and in good order. When the folks asked me how I knew how to go about it I told them that *The Metal Worker* did not lay about where I could see it for nothing."

The officials of the New York and New Jersey Bridge Company state that work on the general specifications and plans for the suspension bridge over the Hudson River are nearly completed, and that as soon as they are finished proposals will be advertised for. The wire for the cable will have to be capable of sustaining not less than 180,000 pounds to the square inch.

The paper box trust of the United States is at an end, through the defection from its ranks of one of the largest manufacturers.

HEATING and PLUMBING.

NEW WORK AND CONTRACTS.

ADDITIONS are being made to the school building at New Britain, Conn., for which the Fuller & Warren system of heating and ventilation has been adopted.

DANIEL W. BURNS, 4681 Lake avenue, Chicsgo, is to do tbe plumbing snd drainge work in the flat building of B. O. Gronset, 13 Anna avenue.

FRANK J. RUH, 1204 Diversey street, Chicago, has the contract for the plumbing snd drainage in the flat building of E. Haegele, Lincoln avenue and Diversey street.

JAMES J. DOYLE, 6040 South Halsted street, Chicago, has the contract for the plumbing in the flat building of James Owens, Green street, between Sixtieth and Sixty-first.

ROBERT R. HEANTSCH, 5631 Wentworth avenue, Chicago, has the contrsct for the plumbing and sewerage in the residence of John Dacy, Honore street, near Thirty-sixth.

ISAAC LEVY, 535 South Halsted street, Chicago, is to do the plumbing in the building of Julius Neiss, Wabash avenue, near Congress street.

JOHN SANDERS, 711 Sixty-third street, Chicago, has the contract for the plumbing and sewerage in the two residences of Levi Pritchard, 5638 5640 Sherman street.

MORRIS BROS., 2442 South Halsted street, Chicago, are to furnish the plumbing and drainage for the building of Robert H. O. Marks, 5113, Aberdeen street.

THE plumbing and steam heating contracts for the new house of Dr. F. W. Calkins, New London, Conn., have not been let.

BIDS for the supplies for the water department of Worcester, Mass., were awarded last week. The contract for cast iron pipes and branches was awarded to the Warren Foundry Company of Phillipsburg, N. J., for $18 a ton net for pipe and $35 a ton for special castings. The contract for lead pipe and pig lead was awarded to the Boston Lead Mfg. Company of Boston for the reason that their bid included delivery to any part of the city. The bids in this line were very close. The company above noted quoted 4¼ cents a pound for lead pipe and 3⅓ cents for pig lead, delivered. The contract for iron castings was awarded to Presby Pero of Worcester for 1⅞ cents a pound for new castings, Mr. Pero agreeing to pay 40 cents a hundred pounds for the old castings.

THE SPERL HEATER COMPANY, Carbondale, Pa., have been awarded the contract for heating by the hot water system the new Burke block on Sixth avenue; it will take one of their largest heaters to do this work.

GREEN & LOGAN, Bridgeport, Conn., are now finishing the plumbing and heating of S. Beardsley's house and D. E. McNamara's block, and have put in furnaces for D. A. Wood, J. Wilcoxson, Mrs. C. C. Seeley, F. Wheeler, C. Bradley and William Coulter, all in Stratford.

A SEVEN ROOM COTTAGE HOUSE is to be built in Stratford, Conn., by F. D. Robertson. There will be a tank in the attic, and the house will have modern plumbing conveniences and furnace heat.

THE BUILDING COMMITTEE of the West Hartford School, Hartford, Conn., are now deciding on the heating system to be adopted, and it is expected that Architect Becker will have the plans out for the building ready for figures within a short time.

E. S. BURNHAM, Hartford, Conn., is to build a $15,000 residence that will be heated by hot water.

ASHTON & GARRITY, Waterbury, Conn., have secured the contract for the plumbing, steam and gas fitting in the new Conlan Block. A McCormack boiler will be used with the H. B Smith Company radiators and Peck Bros. and Sanitas fixtures will be used in the plumbing. They also have the plumbing of the Delanay & Condon Block, and are putting two Page boilers in Dr. Rodman's house.

L. P. WALDO MARVIN, Hartford, Conn., is to erect a brick residence to be heated by hot water and having sanitary plumbing, fire places, mantels, tiling, &c.

THE EXETER MACHINE WORKS, 32 Oliver street, Boston, Mass., are furnishing the radiators for R. H White Company's new building in Boston, Buerkel & Co. having the heating contract.

A. V. FETTER, La Crosse, Wis., has secured the contract to put in the plumbing and heating apparatus for the new hotel at Medford, Wis., at $2500.

SEALED PROPOSALS will be received at the office of the Custodian of the United States Court House and Post Office Building at Jefferson City, Mo., until March 6 for certain plumbing and miscellaneous repairs upon the building.

GEO. L. ROOD, 79 Lake street, Chicago, has the contract for warm sir heating in the three residences of C. A. Baker, Euclid avenue.

FREDERICK J. KENDRICH, 3634 State street, Chicago, has the contract for the plumbing and drainage in the flat building of C. A. Lundelius, 1071–1073 Fifty-sixth street.

NOBLE & THUMM, 290 Lincoln avenue, Chicago, are to do the plumbing and drsinage in the building of H. L. Wheatley, 1965–1971 North Commercial street.

WILLIAM S. VERITY, 229 West Randolph street, Chicago, is to do the plumbing and drainage in the cottage of Samuel Brown, 137 Cosgrove avenue, and in two residences at 1210 and 2141 Potwine place.

BECKER & SCHIRRA, 643 Sedgwick street, Chicago, have the contract for the plumbing and sewerage in the flat building of W. Henning, 1527 and 1529 Grace avenue.

FOSKETT & BROWN, 186 Van Buren street, Chicago, are to do the plumbing in the store building of F. M. Woods, 1278–1280 Washington boulevard.

THE J. W. BROWN PLUMBING COMPANY, 364 Lincoln avenue, Chicago, are to do the plumbing and drainage work in the flat building of J. A. Bengard, 1042 Diversey avenue.

JAMES WELCH, 524 Ogden avenue, Chicago, has the plumbing and drainage work in the school building of Rev. G. Husser, 843 West Taylor street.

THE CHARLES H. SIMMONS COMPANY, 72 Market street, Chicago, are to install a steam heating plant in the store building of Heywood & Morrill, 272 Wabash avenue.

R. & J. KNIGHT, 896 Thirty-first street, Chicago, have the contract for the plumbing and drsinage in the flat building of Henry J. Rohrbsck, 3622 Wentworth avenue.

D. F. DEWAR & Co., 335 Sixty-third street, Chicago, have the contract for the plumbing and drainage in the residence of S. Kohn, Vernon Park avenue and Seventy-second street.

WILLIAM SIMS' SONS, 543 West Madison street, Chicago, have the contract for the plumbing and sewerage in the flat building of R. R. Thomas, 234 South Francisco street.

G. M. HAWTREE & Co., 6822 South Halsted street, Chicago, are to do the plumbing and sewerage in the flat building of Mrs. C. Squires, 517–519 Sixty-fifth street.

WM. C. BLETSCH, 1216 Belmont avenue, Chicago, has the contract for the plumbing and drainage in the flat building of Charles E. Matson, 1185 Sheffield avenue.

BYRNE & RYAN, 254 Forty-third street, Chicago, are to do the plumbing and drainage in the flat building of Joseph Duplesy, Champlain avenue and Sixty-fourth street.

THE UNION FURNACE COMPANY, 65 Dearborn avenue, Chicago, are finishing the steam heating work in the Kersage Building, 2954–2956 Cottage Grove avenue.

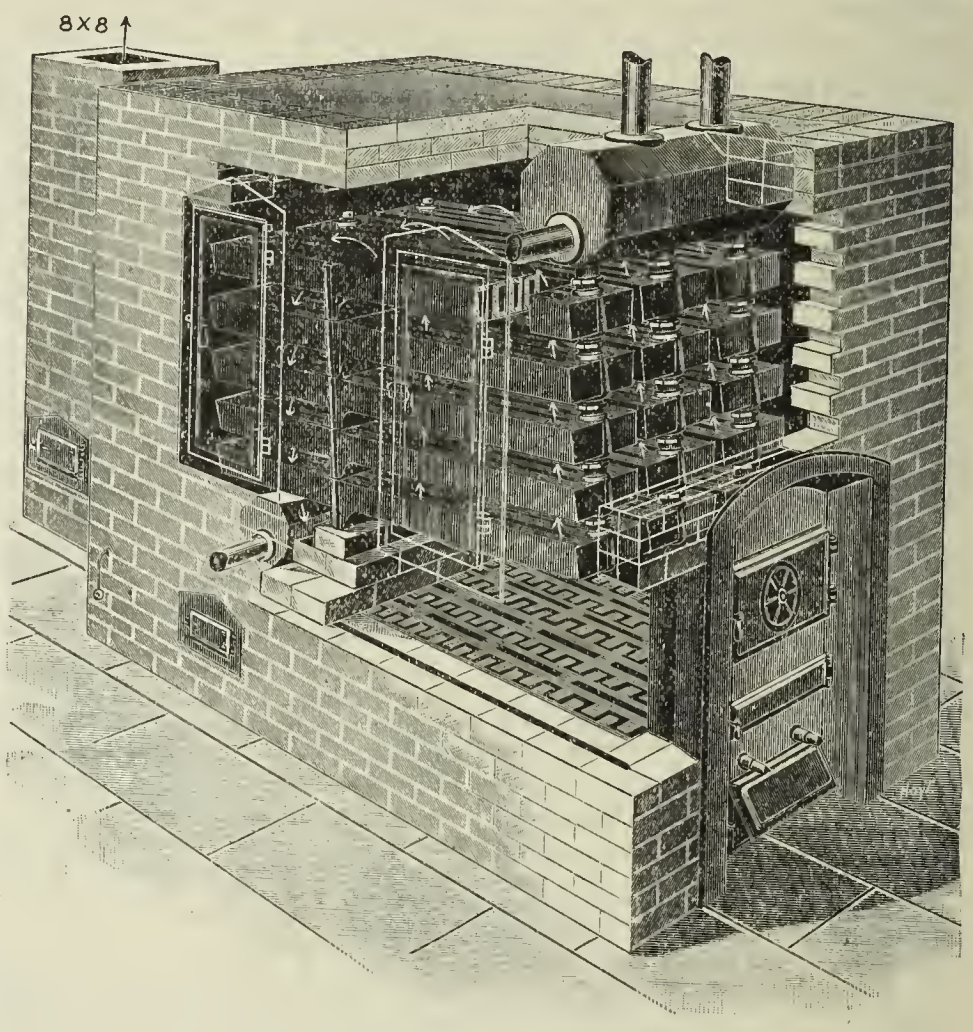
EDWARD B. SILVERY has secured the contract for the plumbing and heating in John Look's new house on New York avenue, Cottage City, Mass., and a Victor boiler is to be installed.

The report of the Chief of the Treasury Bureau of Statistics for January shows the exports of merchandise to foreign countries from the United States to have been $81,332,000 in value during the month, against $85,909,200 in January, 1894. For the seven months ending January 31, the decrease in exports as compared with the first seven months of the last fiscal year was $71,500,000. In January last the exports exceeded the imports by $13,793,746. In January, 1894, the excess of exports over imports was $33,987.549. During the seven months ended January, 1895, the excess of exports over imports was $94,099,612, and the excess for the corresponding period of the preceding year was $206,249,642.

A very decided improvement has taken place in the New York real estate market, and the outlook for the spring months is regarded as being exceptionally bright. Private sales amounting to over $3,000,000 in city realty were closed last week, and brokers report a heavy volume of investment orders in hand.

Representatives of some of the largest sewing machine companies in the United States were in conference at Cleveland, Ohio, last week, with the view, it is said, of consolidating their interests. The capital stock of the new combine is placed at $20,000,000, a large portion of which is likely to be taken by English capitalists. The Singer factories in the United States, Canada and Scotland are to be included.

STEAM AND HOT WATER.



Master Steam Fitters.

A joint conference of the Executive Committee and Advisory Council of the Master Steam and Hot Water Fitters' Association of the United States was held at their headquarters in the Cable Building, New York, on February 15. James Curran was elected a member of the Executive Committee to serve the unexpired term of Frank Williams, who will continue his labors in the interest of the association as State vice-president for New York. The subject of entertainment at the national conventions was discussed, and in future less of the time of the delegates will be devoted to accepting hospitalities than has been the custom in the past. No provision will be made for the exhibition of goods at the next convention, though those who represent the manufacturers will be welcome guests of the association. The advisability of holding the convention at Philadelphia is being discussed, and if favorably decided it is probable that the date, which has not been fixed, will be the 13th, 14th and 15th of June. This is the same week that the National Association of Master Plumbers hold their convention, the date of the latter being the 11th, 12th and 13th of June. Should the same city and the same week be decided upon by the steam fitters it will be greeted with pleasure by many who have in the past regretted the impossibility of attending both conventions. The two associations are to be congratulated on the harmony that makes this possible and probable.

The U. S. Boiler.

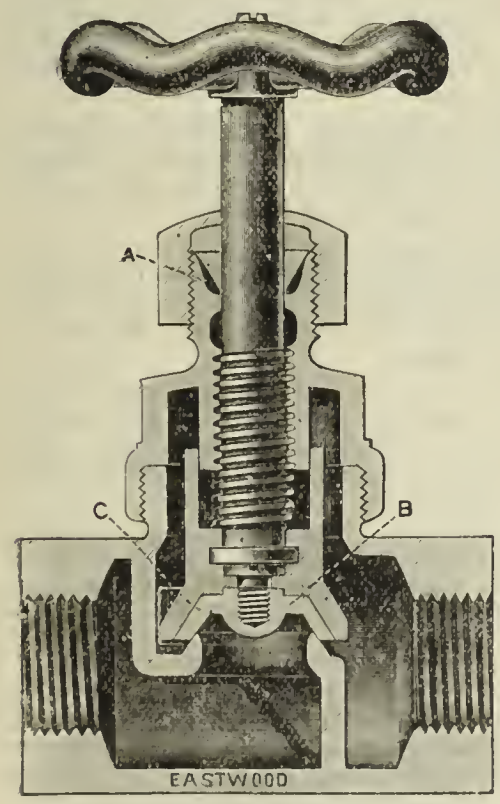
The accompanying illustration shows very clearly the constructive features of the U. S. boiler, made by the U. S. Boiler Company, Titusville, Pa, and which is intended for either steam or hot water. In placing this boiler on the market the manufacturers had in view an apparatus that could be built up by the agents handling it, so they would not be compelled to have a number of boilers in stock to supply the requirements of their trade. The boiler, it will be noticed by referring to the illustration, is composed of a number of sections, placed one over the other, as many rows of sections being used as are necessary to give the required amount of surface for any particular job. The only parts to be provided for are the water leg and dome, the grates and all other parts being such that they can be used in any way required.

The surface of this boiler is over the fire and the heated gases in their upward motion strike the surface at right angles. When they get as high as possible they take a downward course to the flue which is at the lowest point under the water leg. On their upward travel the gases impinge on two-thirds of the heating surface, the downward travel covering the remaining one-third, and the gases leave the boiler at the point where the return water enters. The manufacturers allude particularly to the means by which the gases are held in the boiler until the greatest possible amount of heat is abstracted from them, the gases leaving where the water is coolest—that is, at the point of return to the boiler. It will be noticed the boiler is brick set, which is a system of construction that the manufacturers prefer, the points being made that it reduces the shipping weight of the boiler and that brick setting is more substantial, making the boiler run more evenly and is in the end most economical. The firm sell direct to the trade, and as the boiler can be made up in various sizes, the surface can be worked out with the same care as the radiating surface of the building. The connections are screwed, there being no bolts or packed joints. Each section contains 12½ feet of surface and the boilers can be built up to any size.

The U. S. Boiler with Casing Broken Away.

PHOTOGRAPHS of the indirect radiator of the Niagara Radiator Company, Buffalo, N. Y., are being shown to the trade by Walter Pendleton of the New York office, 89 Centre street.

Introducing Heating Systems.



BY LISTENER.

A dealer in heating apparatus has pursued a course, with a view to extending his business, that may be followed by others throughout the country with advantage. At this season of the year, when houses are well or poorly heated, the public are more likely to be interested in new methods of heating than later in the year, and with this for an incentive he has prepared a series of articles on the use of both steam and hot water for house heating that are appearing in his local paper. It is claimed by good engineers that for some special buildings either steam or hot water is better adapted for securing a comfortable temperature throughout than some other means of heating. While this may be unquestionably true, many citizens are not only not aware of the truth, but in all probability would be slow to accept it on its presentation. If such a citizen was in need of heating apparatus and was approached by a dealer in either steam or hot water apparatus, the probabilities of a sale would be very slight. No little time

would be required to educate the prospective purchaser so that the value of either of these systems would be apparent to him. If, however, he had read in his local paper a series of articles giving the facts simply and comprehensively, without bias, about the different methods of heating and the manner in which they should be installed, the local heating man who furnished them would be silently strengthening his prospects for future trade. It is more than probable that the field of steam and hot water heating could be very materially enlarged if in a plain, sensible way the peculiarities of each were fully explained, where the average householder could digest them at his leisure and with no feeling of constraint to buy. There is yet in the minds of the people an idea that there is more or less danger of an explosion from a steam boiler for house heating purposes, and that a hot water heating system, though not so dangerous, is likely to leak and flood rooms, and while the people remain unfamiliar with these systems the work of education that is before both the dealer and the salesman of such apparatus will be arduous. Articles explaining away these notions would be interesting, and there should be no difficulty in securing their insertion in the local papers.

The Eastwood Valve.

The illustration herewith shows a sectional view of the Eastwood valve, for which patents were granted H. R. Frisbie December 4, 1894, and which are controlled by the manufacturers, the Eastwood Wire Mfg. Company, Belleville, N. J., and 39 Dey street, New York. The valve is made of perfection bronze, and it is claimed that the workmanship in every detail is of the highest possible grade, as the valve is manufactured specially to withstand the highest pressures. All parts are interchangeable, the principal feature being the copper disk which makes the face of the valve and the conical seat upon which it rests. This copper disk is struck up under a 500 pound drop hammer and is firmly fastened into the sleeve which secures the valve spindle by a screw held in place by the valve spindle. By this means it is impossible for the disk to blow out under a high pressure and to find its entrance into the steam pipe and choke it. The sleeve around the valve spindle gives additional strength to withstand the high pressure under which it is said that the valve can be used without disadvantage. Referring to the engraving, B designates the disk holding screw and shows the method by which the screw is locked which holds the disk to the sleeve, while C shows the disk. A is one of four flutings which is placed in a recessed cavity at the top of the valve for packing. The object of the fluting is to prevent the packing from turning with the valve spindle and bringing a pressure against the valve cap. It is pointed out that the method of making the seat joint is entirely new, as the frustum of the cone against which the struck up copper removable disk fits permits any sediment to be washed from the surface previous to the disk setting down on it and thus always insuring a tight joint. One of the tests to which this valve has been subjected was the screwing into one side of the valve of a 16-foot pipe which was filled with sand and connected with a live steam pipe. Then steam at 80 pounds pressure was turned on and all the sand in the pipe was forced through the valve, and after steam had commenced to issue the valve was closed and no difficulty was found in securing an absolutely tight joint. On removing the valve for examination its seat was found to be perfect. The valves have also been successfully tested on a number of digester plants where the steam pressure has been above 120 pounds as well as on the tops of digesters where a pressure of 80 pounds of sulphurous acid gas existed, and after months of wear they still prevent leakage. The valves are made as horizontal, angle and cross valves in all sizes from ⅛ up to 3 inches. They are made with iron body and composition mounted, in all sizes from ¾ to 14 inches, and it is stated that larger sizes will be furnished if desired. Price lists and descriptive circulars can be had by writing for them.

The Eastwood Valve.—Sectional View.

CHICAGO CAPITALISTS are negotiating with H. T. Yaryan of Toledo, Ohio, for an interest in his central station hot water heating system, with a view to introducing it in some of the Chicago residence suburbs. The heating plant that he has in operation in Toledo heats about 25 residences by means of hot water, which is pumped through underground mains to the residences. In each house is a coil of pipes located in the basement. Through this coil of hot pipes cold air is forced by means of a flue taking air through an opening in the foundation walls. This is distributed through the house in the same manner as hot air from a furnace The water used in the system is taken from the city water works in a large tank holding several hundred barrels, from which it is drawn into two upright heating cylinders about 5 feet long and 20 inches in diameter, where it is heated to a temperature of 180° by steam from a large boiler. By means of two pumps it is then distributed to the residences, in all through about 2 miles of pipe, and returned to the heating cylinders, where, having lost about from 20° to 30° of heat, it is used over again and kept in constant circulation. The boiler from which the steam is taken also furnishes the power for the operation of an electric lighting plant supplying light for about 38 residences in the neighborhood.

Uniform Contract.

In accordance with instructions of the sixth annual convention, Master Steam and Hot Water Fitters' Association of the United States, the Committee on Uniform Contract have submitted the following report and contract:

To the Master Steam Fitters and Heating Engineers of the United States:

We present for your consideration a Uniform Contract, being a digest of the opinions received at this office, grouped in a short form, and with the fewest possible blanks.

The words in italics are to show the proper filling out of the contract, and in the printed forms would be blank, as shown by dotted lines.

This Contract aims to cover items which have been found to operate to the disadvantage of our members, namely:

FIRST. That the apparatus shall be paid for when finished; the contractor, at the same time, holding himself responsible to maintain his guarantee at any time called upon. It is hoped this will avoid a retention of money for an unlimited period without recompense to the contractor, being in every case considerable loss.

SECOND. Relating to extra work. In this Contract it is put on the basis of being paid for at or near the time done, instead of being retained until final certificate is issued.

There having been a difference of opinion as to terms of payment, your attention is directed to Alternate Clause for Article VI.

Your attention is also directed to the clause providing for arbitrating disputes as to the true meaning of plans and specifications. It will be of great advantage if this or a similar plan can be carried out.

COMMITTEE ON UNIFORM CONTRACT.

Uniform Contract for the Construction of Heating Apparatus (to Be) Adopted for Use by the Master Steam and Hot Water Fitters' Association of the United States.

(*Copyright, 1895, by the Master Steam and Hot Water Fitters' Association of the United States.*)

THIS AGREEMENT, made and concluded at *Kalamazoo*, State of *Michigan*, the *first* day of *January* in the year one thousand eight hundred and ninety-*five*, by and between *Jones & Brown*, of *Chicago*, State of *Illinois*, for *themselves* and *their* legal representatives, parties of the first part (hereinafter designated the Contractor), and *R. I. Peters*, of *Kalamazoo*, State of *Michigan*, for *himself* and *his* legal representatives, party of the second part (hereinafter designated the Owner).

WITNESSETH, That the Contractor, in consideration of the fulfillment of the agreements herein made by the Owner, agrees with the said Owner as follows:

ARTICLE I. The Contractor, for the consideration hereinafter provided, covenants and agrees with the Owner that the Contractor shall and will, within the space of *three* months next after the date hereof, in a good and workmanlike manner, and at his own proper charge and expense, well and substantially build, furnish and erect a certain *Steam* Heating Apparatus, at

444 4th Avenue, City of Kalamazoo, according to the Specifications, Drawings and Plans designed by *Thomas Robinson, Architect,* which Specifications, Drawings and Plans are made a part of this Contract and are identified by the signatures of the parties hereto.

ARTICLE II. No alterations shall be made in the work shown or described by the Drawings and Specifications, except upon a written order of the *Architects,* and when so made the value of the work added or omitted shall be computed by the *Architects,* and the amount so ascertained shall be added to or deducted from the contract price. In the case of dissent from such award by either party hereto, the valuation of the work added or omitted shall be referred to three (3) disinterested arbitrators, one to be appointed by each of the parties to this Contract, and the third by the two thus chosen; the decision of any two of whom shall be final and binding, and each of the parties hereto shall pay one-half of the expenses of such reference.

ARTICLE III. Should any difference arise in interpreting the Plans or Specifications, involving or assuming additional compensation, the Contractor shall, upon written notice from the Owner, immediately execute such interpretation, the question of compensation to be determined on completion by arbitrators, as provided in Article II.

ARTICLE IV. All the materials and workmanship of the apparatus to be of the quality as expressed in said Specifications, Drawings and Plans; said Owner to reserve the right to reject, through himself or his authorized agent, all material or workmanship of an inferior quality, which said Contractor may attempt to use in the erection of said Heating Apparatus, and if the said Contractor, after being notified, neglects or refuses to do the work, or furnish the materials as called for in the Specifications, Drawings and Plans, then, and in that case, said Owner shall give notice in writing to the Contractor, which notice is to set forth in full the cause or causes of complaint. If the Contractor demurs and refuses to do the work or furnish the materials as directed in the notice of complaint, within three days from date of said notice, resort to arbitration shall be had as provided in Article II.

ARTICLE V. The Owner shall not, in any manner, be answerable or accountable for any loss or damage that shall or may happen to the said works, or any parts thereof respectively, or for any of the materials or other things used and employed in finishing and completing the same, loss or damage by fire excepted. The Contractor shall be responsible for all damage to the building and adjoining premises, and to individuals, caused by himself or his employees in the course of their employment.

ARTICLE VI. It is hereby mutually agreed between the parties hereto, that the sum to be paid by the Owner to the Contractor for said work and materials shall be *Seven Thousand Dollars ($7,000 00),* subject to additions and deductions as hereinbefore provided, and that such sum shall be paid in current funds by the Owner to the Contractor, in monthly payments to the amount of *90* per cent. of the value of materials delivered to and labor performed in the said building during the preceding month, and the remaining *10* per cent. shall be paid as a final payment within *30* days after the contract is fulfilled.

All payments shall be made upon written certificates of the *Architects* to the effect that such payments have become due.

ARTICLE VII. It is mutually agreed that payments for all additional work shall be made at the same time and in the same manner as contract payments, Article VI.

ARTICLE VIII. It is mutually agreed that should default be made in any of the payments as herein provided, the Contractor shall have the right to stop work and withdraw all unused materials until such payment is properly made, or may at his option cancel the contract.

ARTICLE IX. It is further mutually agreed that the essence of this Agreement is that the Owner purchasing this apparatus and paying therefor will receive full value to the extent that it will warm the subdivisions of the building indicated on the plans to *70* degrees Fahrenheit in the coldest weather; but nothing herein contained, or in the Specification accompanying the same, shall prevent the Contractor from receiving from the Owner a final payment for the work herein and at the time stipulated.

ARTICLE X. The Contractor guarantees his workmanship and materials, the capacity of the boiler, the circulation of the system and the efficiency of the heating surfaces, all as called for in the Specifications hereto attached, and should any defects or deficiencies occur, other than from neglect on the part of the Owner or his employees, within the term of one year from the above date, the Contractor agrees to make good the same upon a written notice from the Owner at the Contractor's expense.

ARTICLE XI. If at any time there shall be evidence of any lien or claim for which, if established, the Owner of the said premises might become liable, and which is chargeable to the Contractor, the Owner shall have the right to retain out of any payment then due, or thereafter to become due, an amount sufficient to completely indemnify himself against such lien or claim. Should there prove to be any such claim after all payments are made, the Contractor shall refund to the Owner all moneys that the latter may be compelled to pay in discharging any lien on said premises made obligatory in consequence of the Contractor's default.

ARTICLE XII. It is further mutually agreed, between the parties hereto, that no certificate given or payment made under this Contract, except the final certificate or final payment, shall be conclusive evidence of the performance of this Contract, either wholly or in part, and that no partial payment shall be construed to be an acceptance of defective work or improper materials.

ARTICLE XIII. The said parties for themselves, their heirs, executors, administrators and assigns, do hereby agree to the full performance of the covenants herein contained.

IN WITNESS WHEREOF, the parties to these presents have hereunto set their hands and seals, the day and year first above written.

In presence of

J. B. Saxe

Jones & Brown (SEAL.)

R. J. Peters (SEAL.)

(SEAL.)

(SEAL.)

ALTERNATE FOR ARTICLE VI.

It is hereby mutually agreed, between the parties hereto, that the sum to be paid by the Owner to the Contractor for said work and materials shall be *Seven Thousand Dollars* ($ *7,000*) subject to additions and deductions as hereinbefore provided, and that such sum shall be paid in current funds by the Owner to the Contractor in installments, as follows:

When *The Boilers are delivered and set,* $ *1,500.00*

When *Steam Mains and Risers are in place,* $ *1,500.00*

When *The Radiators are delivered,* $ *1,500 00*

When *The Radiators are connected,* $ *1,500 00*

And the balance of $ *1,000 00* as a final payment to be made within *30* days after this contract is fulfilled.

All payments shall be made upon written certificates of the *Architects* to the effect that such payments have become due.

HEATING NOTES.

THE STEAM FITTER sees the Standard radiators at their best as displayed at 206 Centre street by John I. Leitch, manager of the New York house of the Standard Radiator Company, Buffalo, N. Y. A rich Brussels carpet covers the floor and the different heights of the 2, 3 and 4 column Standard radiators show with fine effect in the varied styles of decoration as arranged at one side of the showroom. Radiators of the 3 column pattern occupy the show window, and Standard indirect radiators are displayed at the entrance. On the other side of the showroom direct-indirect radiators are shown, and on a book stand circulars of the goods are conspicuously placed, while the trade papers are convenient for use by the visiting dealer. At the back of the showroom is the desk of Mr. Leitch, and in the wareroom beyond, which fronts on another street, a large line of radiators are carried in stock.

AT A MEETING of the creditors of the Pawtucket Steam & Gas Pipe Company held at Pawtucket, R. I., a report was presented in which was the following proposition: That the firm would pay 30 per cent. of their liabilities in cash within 30 days and 25 per cent. of their liabilities in 5 payments of 5 per cent. each, in 6, 9, 12, 15 and 18 months respectively. This proposition was unanimously accepted. Creditors or their representatives were present to the amount of $50,000.

THE HAMPSON FLEXIBLE STEAM JOINT COMPANY has been organized at Lakeport, N. H., with a capital of $35,000. The following are the officers: President, John S. Crane; vice president, W. H. Hampson; treasurer, B. F. Drake; secretary, M. F. Crane; directors, J. S. Crane, B. F. Drake, H. S. Young, W. H. Hampson, F. A. Barbey, H. E. Webster, A. J. Lane.

W. A. RUSSELL, the New York representative of the Detroit Lubricator Company, Detroit, Mich., spent the first of the week in Philadelphia and secured a contract for 5000 valves from a heating contractor.

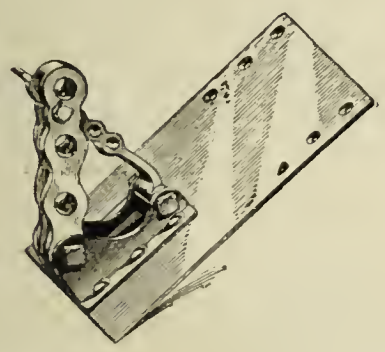
THE UNITED STATES RADIATOR COMPANY, Saltsburg, Pa., are using a new lithograph letter head which shows their Ornate radiator at one side, with the word "Ornate" in a diamond with the words "trade-mark" under it in the center, and at the other side over the company's name is an eagle with spread wings and an American flag in each claw.

SECRETARY J. E. HOLLAND of the Holland Radiator Company, Chicago, is in New York for a few days talking radiators to the trade.

THE LYMAN WATER CIRCULATING & HEATING COMPANY have been incorporated at Chicago by Thomas Lyman, John S. Williams and William F. Storms.

THE AMERICAN BOILER COMPANY, 84 Lake street, Chicago, are now prepared to supply pipe and steam fittings from their warehouse, 46-48 South Canal street.

THE JOHN DOUGLAS COMPANY are to remove their Chicago office and showroom from Room 511, 34 Clark street, to more commodious quarters at 131 Lake street.



The safety of the Atchison bridge over the Missouri River at Atchison is said to be greatly endangered by the encroachment of the river. A canal is being dug to partially divert the stream through the island above the city. The canal will be over 1 mile in length and about 70 feet wide, its construction involving the removal of 167,000 cubic yards of material.

The Elgin National Watch Company and the Waltham Watch Company are to be consolidated and pass into the possession of a British syndicate. The valuation of the two properties is $16,000,000.

ROOFING AND CORNICE.

The Baird Snow Guard.

E. J. Johnson & Co., well-known dealers in roofing slate, of 38 Park Row, New York City, are the sole agents for the Baird Snow Guard, illustrations of which are presented herewith. The guard is the invention of John Baird, a practical roofer of thirty years' experience, who has long realized the need of a guard that would fully meet the wants of the trade. For some time he has been engaged in working out his ideas, resulting in the guard here shown. The device consists of an iron plate, in size corresponding to that of roofing slate, and provided with an upright support for the series of rods or pipes to hold back the snow. The upright support is adjustable so that it may be set for any pitch of roof. It is fastened at the bottom with a ½-inch bolt, and at its upper end to a supporting rod containing five holes, thus allowing it to be adjusted to any desired angle. A view of the guard, showing the manner in which it is constructed, is shown in Fig. 1 of the engravings. The guard is made of malleable and wrought iron galvanized, particular care being taken that its strength shall be sufficient to withstand any strain to which it is likely to be subjected. In Fig. 2 of the illustrations is shown a section of the roof of a building, clearly indicating the appearance of the snow guard when in position. Price lists of this snow guard will be furnished on application to Johnson & Co.

The Baird Snow Guard.—Fig. 1.—General View of the Device.

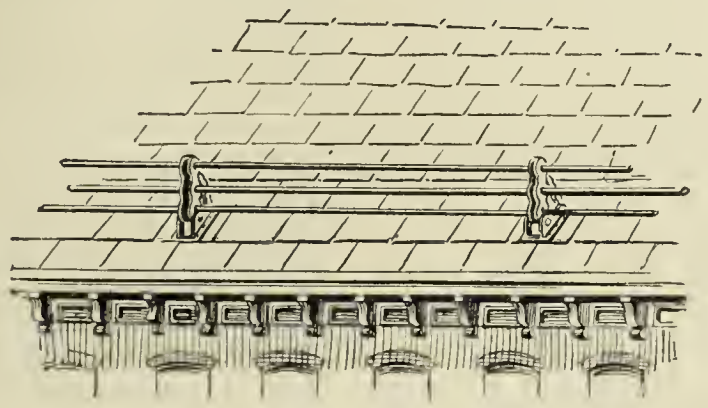


Fig. 2.—Appearance of Guard when in Position.

THE EAST BIRMINGHAM IRON ROOFING & CORRUGATING COMPANY, Birmingham, Ala., are sending out by way of advertisement a reply postal card, on one of which they tell of their business and on the reply sheet is a blank, making it easy to order roofing and siding of different sorts.

FLASHINGS.

THE PLUME & ATWOOD MFG. COMPANY, Waterbury, Conn., are about to build an extension 200 feet long to their main building. The building will be partly two and partly three stories in hight, of mill construction, with iron beams, gravel roof, metal skylights, &c.

J. J. COLVIN, 159 La Salle street, Chicago, is to do the galvanized iron work and slate roofing for the four-flat building of R. Stokes, Rockwell street, near North avenue.

H. J. LAWSON is to make very important additions to his metal works upon Lowell street, Manchester, N. H. Electric power has been introduced, and the power house is not only very convenient but is also a handsome sample of metal work, well worthy of inspection. Machines have been added for the spinning of copper, brass and zinc work. A neat and convenient forge room occupies one corner of the shop. Ponderous machines for the crimping and cutting of metal, and smaller ones for the shaping, burnishing and the other details of the architectural sheet metal work give Mr. Lawson the equipment for successfully competing for work all over New England.

JAMES J. WHITE, 185 Dearborn street, Chicago, has the contract for the copper cornices and 70 squares of tin roofing for the Duncan Avenue School, Duncan avenue and Seventy seventh street.

THE GALVANIZED IRON MAKERS in England have formed a combination for the checking of ruinous competition and the protection of their interests generally under the title of the Galvanized Sheet Iron and Steel Association. A large majority of the trade have, it is understood, joined the new association.

HENRY HENNINGSEN of Jersey City, N. J., is putting the finishing touches on the new City Hall job, in Jersey City, where he has used some 20 tons of galvanized iron and about 10 tons of 16-ounce cold rolled and soft copper, with imported Holland tile. The work amounts to about $16,000. He is also doing the bay windows and copper cornice for Patrick Byrne's new handsome residence in the same city, 18-ounce cold rolled copper being used.

B. M. SCHELLMANN, manufacturer of cornices and skylights, has removed to more spacious quarters at 190 Wooster street, New York City, his former place of business, where he had been for 25 years, having been torn down to make room for new buildings.

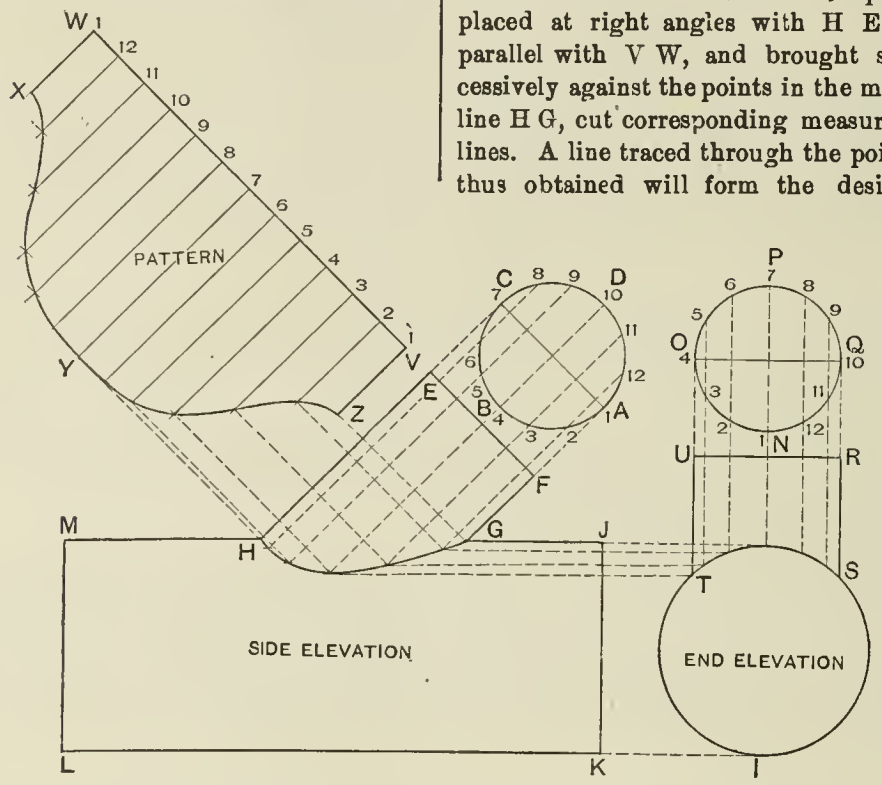
THE YOUNGSTOWN IRON & STEEL ROOFING COMPANY, Youngstown, Ohio, have appointed the Andrews Bros. Company, John McLauchlan, manager, 808 New York Life Building, Chicago, as their general Western agent, and ask the trade to correspond with them when in the market for anything in their line.

Sheet zinc, the British consul at Hiogo reports, finds a large and increasing demand in Japan, being indispensable as lining for cases containing matches for export. An advance in the price of this material has lately occurred in that country.

The British consul at Berne, Switzerland, reports to his government that the exports of aluminum from Switzerland increase steadily. Last year they were about $100,000 more in value than in the preceding year.

It is reported by the *British Trade Journal* that the Continental Zinc Syndicate for the regulation of the European mines of the metal is in danger of being disrupted. Negotiations for the renewal of the convention are still going on, but the difficulties in the way are said to be such that an agreement seems most unlikely.

Probably the largest single order for aluminum ever given is that of the French Minister of Marine. It is for 92,500 pounds of the metal, to be used in the construction of steam launches for the navy.



The dire effects of the flood at Williamsport, Pa., last year are reflected in the annual statement of the lumber operations from that point for 1894. The shipments are shown to have aggregated 196,185,000 feet, a decrease of 78,150,000 feet from the figures for 1893. The flood swept away 140,000,000 feet of logs from the booms, as well as much manufactured lumber from the yards, only a portion of which was recovered.

Immigration to the United States in January amounted to 8784 persons, against 9308 arrivals in January, 1894. It is still considerably below the average for many years.

THE TIN SHOP.

Pattern for Tee Joint.

From O. E. S., *New Prague, Minn.*—Will *The Metal Worker* publish a method for obtaining the pattern of a tee joint at an angle, the pipes being round and one larger than the other? Also pattern for elliptical pipe to join a round pipe at an angle.

Pattern for Tee-Joint at an Angle, One Pipe Being Larger than the Other.—Fig. 1.—Joint Between Round Pipes.

Answer.—In Fig. 1 is shown a side and end elevation of the article for which the pattern is desired. As indicated by A B C D, N O P Q and T S I, the pipes are round, pipe E F G H being joined to J K L M at an angle, as indicated by M H E or F G J. The end elevation is represented by T U R S I and the side elevation by M H E F G J K L The two profiles, A B C D and N O P Q, are to be drawn in line with the side and end elevations, as shown. To obtain the pattern of H E F G it is necessary to determine the points in H G through which the miter line is drawn. To do this divide the two profiles into the same number of equal parts, commencing at the same points in each. Draw lines from the points in N O P Q, parallel with U T, cutting T S. In a similar manner draw lines from the points in A B C D, parallel with H E, as shown. From the points in T S draw lines parallel with M J, which produce until corresponding lines from the two profiles intersect. Through the several points of intersection thus obtained draw the miter line H G. For the pattern of E F G H proceed as follows: On E F extended as V W, lay off a stretchout of profile A B C D, through the points in which draw the usual measuring lines at right angles to the stretchout line. With the T square placed at right angles with H E, or parallel with V W, and brought successively against the points in the miter line H G, cut corresponding measuring lines. A line traced through the points thus obtained will form the desired pattern. Then V W X Y Z is the pattern for part of article shown in side elevation by E F G H and in end elevation by R S T U. In Fig. 2 J′ K′ L′ M′ represents a round pipe, to which is joined the elliptical pipe E′ F′ G′ H′, profile of which is shown by A′ B′ C′ D′. In this example the major axis B′ D′ of ellipse is drawn parallel with side of arm H′ E′. In Fig. 3 the round pipe is represented by J″ K″ L″ M″, and the elliptical pipe by E″ F″ G″ H″. In this example the minor axis B″ D″ of ellipse A″ B″ C″ D″ is drawn parallel with side of arm H″ E″. The same method was used for obtaining patterns in Figs. 2 and 3 as was used for Fig. 1

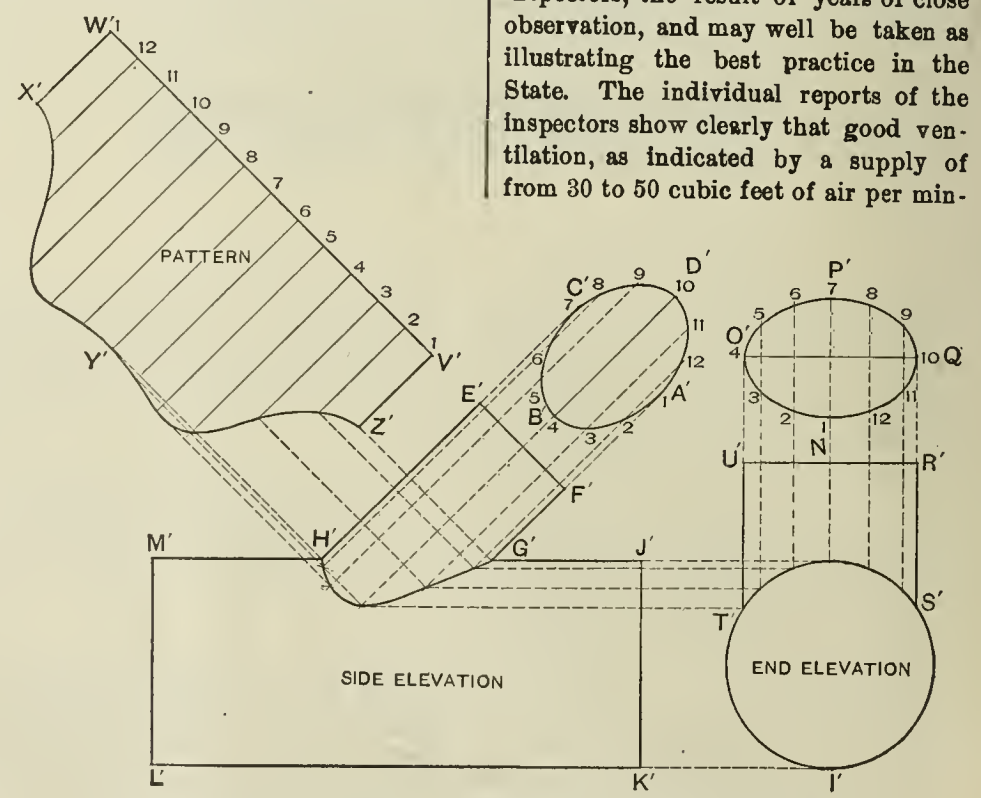


Fig. 2.—Joint Between Elliptical and Round Pipes.—First Example.

Heating and Ventilating.

That better ventilation can be secured in public and manufacturing buildings is well evidenced by the working of the law controlling this matter in the State of Massachusetts. The enforcement of this law being delegated to the State Board of Police, the report of the chief of that body, Rufus R. Wade, is always an interesting volume and clearly indicative of the progress in this particular line. The report for 1894, which has just appeared, although detailing the work of the department in all its various branches, devotes by far the larger portion of its pages to reports upon school house inspection. Of particular value is a series of lithographed plates illustrating model heating and ventilating arrangements for school houses. These embody the ideas of the inspectors, the result of years of close observation, and may well be taken as illustrating the best practice in the State. The individual reports of the inspectors show clearly that good ventilation, as indicated by a supply of from 30 to 50 cubic feet of air per minute per pupil, can be secured when the system is properly designed. They advocate the use of mechanical means in

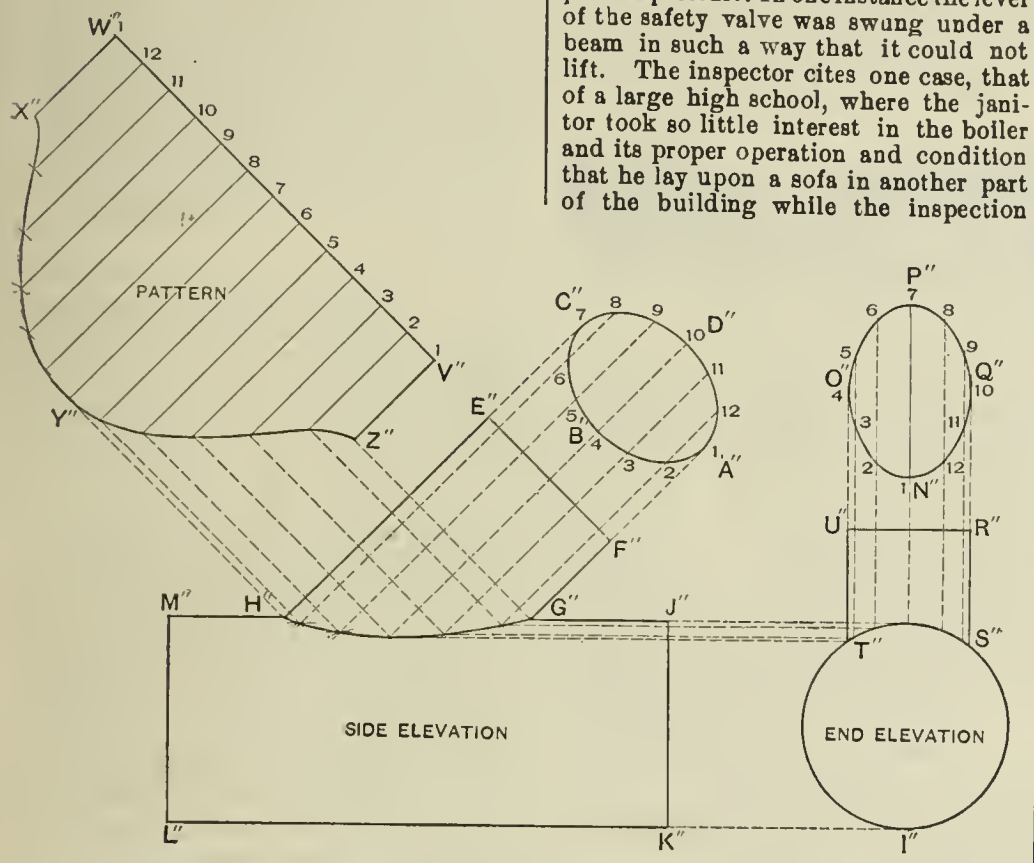
the shape of a fan for moving air wherever possible, and illustrate one building in which one small fan forces air to hot air furnaces and another withdraws it through the ventilating flues. Each year thus makes simpler the enforcement of the law because of the better understanding of the principles involved in ventilation and a realization that good ventilation can after all be easily secured and at moderate cost.

Inspection of Uninsured Boilers.

In 1893 the Legislature of Massachusetts authorized the appointment of a temporary inspector upon uninsured steam boilers. The thorough investigations of this officer revealed such a condition of things that the succeeding Legislature continued his services, and his report for 1894 certainly warrants his still further continuance and the enactment of more rigid laws controlling the operation and inspection of this class of boilers. This should apply particularly to that most dangerous class, second-hand boilers. The immense responsibility resting upon the man in charge of a boiler is too often overlooked, and the daily peril of those in the vicinity of the boiler is never comprehended until some dire disaster occurs. In factories where the boiler produces steam for both heating and power some most startling conditions were discovered. In one instance a small upright boiler was found, upon application of hydrostatic pressure, to be leaking badly, while a portion of the internal shell had been so eaten away that for a distance of several inches it was reduced to less than $\frac{1}{32}$ inch in thickness. The owner nevertheless supposed that everything was in first-class condition.

School House Boilers.

As the work of this department became more widely known, requests were frequently made for the inspection of boilers in school buildings. The requests were complied with, and in every case defects were found, many of them of such a character that the boilers must soon become dangerous, while some were found already dangerous. It has been revealed in this way that very few school house boilers are inspected, and the fact has been emphasized that the majority of janitors are totally ignorant of boiler inspection or where to look for deterioration, and that many of them know nothing concerning the safe management of a boiler. Usually school house boilers are designed for and expected to run at low pressure, but nevertheless the inspector found numerous cases where the safety valves were stuck or overloaded, in some cases to over 60 pounds pressure. In one instance the lever of the safety valve was swung under a beam in such a way that it could not lift. The inspector cites one case, that of a large high school, where the janitor took so little interest in the boiler and its proper operation and condition that he lay upon a sofa in another part of the building while the inspection was being made. The inspector further pertinently remarks that the condition of the boiler and its surroundings was indicative of the character of the man. Everything covered with ashes and soot, a hand hole carelessly packed and things generally in a condition to rapidly deteriorate. The necessity of the best of attention and of frequent inspection was rendered startlingly evident in the case of the explosion of a boiler at the Center School, Uxbridge, Mass., upon which the inspector also reports. The effect of the explosion was to lift bodily the floor immediately above, with the children thereon. Almost miraculously no one was fatally or serlously hurt, although nearly all were injured. The exploded boiler, which had been in use about 15 years, was of cast iron, and was found upon inspection to have had an unstayed surface 28 x 40 inches, in some places less than ¼ inch thick. Apparently for years this had been acting as a more or less flexible plate under the low pressure carried until it had cracked at the bending lines, and excess of pressure upon this particular day had caused the disaster. With the evidence of such necessity for further legislation the chief renews his recommendation of the previous year for the enactment of a law regulating the use of steam boilers and for the better protection of life in the use of the same.



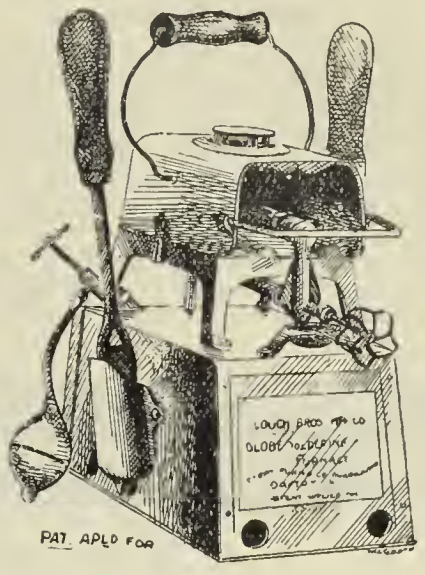


Fig. 2.—Joint Between Elliptical and Round Pipes —Second Example.

Globe Soldering Furnace.

The Couch Brothers Mfg. Company, Dayton, Ohio, are placing on the market a new combination furnace for tinners, plumbers and canning factories under the name of the Globe soldering furnace, which is illustrated in the accompanying cuts. Fig. 1 is a general view of the furnace, while Fig. 2 shows the burner. The furnace is particularly adapted for work out of doors in all kinds of weather, and the manufacturers allude particularly to the stationary generator, so arranged that the flame will light the burner from the generator, making an exceedingly hot fire. It is also noted that the burner is of such shape and construction that it will not clog up by dropping solder. The manufacturers claim that the Globe furnace by having the needle point $\frac{3}{16}$ inch from the mixing tube will save one-half of the fuel. The furnace is noiseless and is used to melt lead and heat coppers at the same time. The tank is concealed from view and is thereby thoroughly protected. The burner, it is pointed out, can be attached to any other furnace.

Globe Soldering Furnace —Fig. 1.— General View of Furnace.

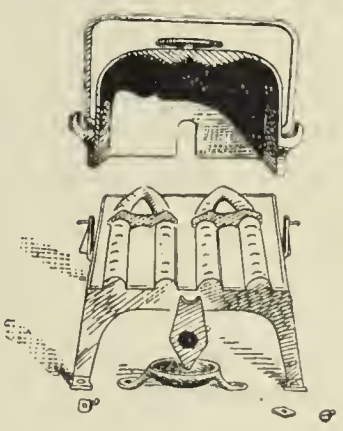

Fig. 2.—View of Burner.

A German patent has been granted to Ida Ouaglio of Berlin for a new method of coloring aluminum. The objects made from aluminum are first coated with zinc and then colored black by a solution of either platinum, copper, nickel or antimony. To protect the designs a varnish is employed.

THE RETAIL STORE.

Patent Air Blast Oven and Broiler Burner.

The Monarch Stove Company of Mansfield, Ohio, are using in connection with their Regal Monarch cabinet range for gasoline made on the generating principle, and their cabinet ranges in which gas is employed as fuel, the burner shown in the accompanying illustration. The device is known as a patent air blast oven and broiler burner. and consists of two hollow quadrilateral cast plates 12 x 4 inches bolted together,

Patent Air Blast Oven and Broiler Burner.

and having slots sawed along both edges. Through these slots or holes the air carried up from below is discharged and mingles with the gas from the burner, forming a proper mixture for combustion. The adjustment is such as to give the proper amount of air, the result being a blue smokeless flame of intense heat. By means of this burner the oven is fully heated, while at the same time broiling may be done below. The makers state that the success of the burner is found in the combination of the gas and air supplied to it.

MEMORANDA.

THE CATALOGUE issued by Emerson & Fisher, St. John, N. B, for the year 1895 is a handsome publication of over 300 pages, bound in vermilion covers, the front carrying an attractive, simple design. The first section of the publication is devoted to deep and shallow stamped wares, then comes planished tinware, followed by japanned ware, Royal embossed ware, pieced tinware, granite or gray enameled wares, white enameled ware, brass and copper ware, the latter ending the first general division of the work. The second begins with wire goods, including poultry netting, bird cages, &c. Then come wooden ware, refrigerators, miscellaneous articles, brushes, hollow ware, oil stoves, lanterns, sad irons, mouse traps, aluminum ware, cutlery, scissors, kitchen utensils, axes, hammers, hardware, the latter covering a large assortment. Toward the end attention is given to forges, farming tools, fire sets, registers, tinners' tools, &c.

THE HAUPT STOVE & HEATING COMPANY, 615 West Market street, Louisville, Ky., sustained a loss of $1500 by fire last week, which was covered by insurance.

THE ASHLAND SCREEN & MFG. COMPANY of Ashland, Wis., are erecting buildings for the manufacture of stove boards. The size of the main structure will be 45 x 100 feet. In addition there will be a warehouse 24 x 55 feet and an engine and boiler room 19 x 26 feet. The boards will be crystallized by a special process. The officers of the company are E. Moeckel, president; H. Rettinghaus, vice-president, and John Moser, secretary and treasurer.

THE GEUDER & PAESCHKE MFG. COMPANY, manufacturers of tinware, Milwaukee, Wis., now offer a full line of cream cans and cream can trimmings for the ensuing spring trade. Among the specialties they make for the dairy trade are their widely used Fairmont cream can gauges and their self-locking cream cans and self-locking trimmings, patents on which have just been granted and which they now propose to push vigorously, having lately very materially perfected their tools for the production of these goods.

GURNEY REFRIGERATOR COMPANY, Fond du Lac. Wis, are getting out a hanger 14 x 22 inches in size for jobbers' use, on which is illustrated their refrigerator, also parts of the same, and which calls attention to features of their goods. The company are bringing out a new line of soft wood (or linden wood) refrigerators which they refer to as handsome in appearance and as finished in imitation oak; the imitation being so good, it is remarked, that only a close inspection reveals the fact it is not real oak.

THE KEWASKUM MFG COMPANY have been organized at Kewaskum, Wis., with a capital stock of $10,000, to manufacture tinware and sheet iron ware. The machinery has been ordered for the factory. They will also make the Hayes clothes drainer. The officers are as follows: President, Nicholas Marx; secretary, David Rosenheimer; treeasurer, Adolph Rosenheimer.

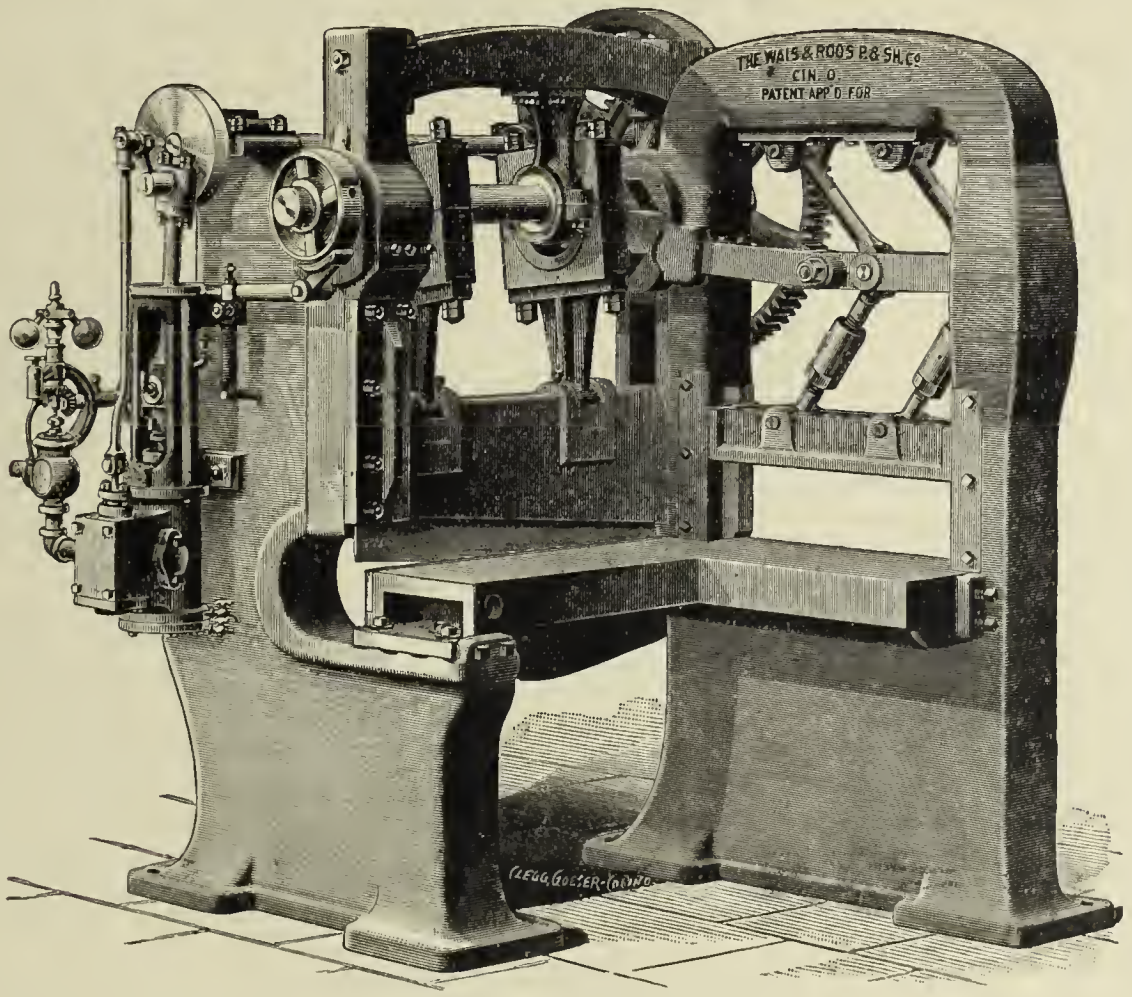
"HOW TO SPRAY, When to Spray and What Pumps to Use to Insure the Life and Yield of Fruit Trees, Grape Vines, Berry Bushes, &c.," is the descriptive title of a neat pamphlet issued by the Goulds Mfg. Company, Seneca Falls, N. Y. It is in reality a special catalogue and price list of spraying pumps and nozzles for every service which the Goulds Company manufacture. The Standard and Star double acting spraying pump is shown and fully described and prices given. The Semi-Rotary, Clock, the All About, Sentinel, Barrel spray cart, knapsack pumps, bucket pumps, force pumps, &c., are all similarly noticed. Fittings are shown toward the end and a spraying calender prepared by the Experimental Station of Cornell University is appended.

THE CATALOGUE issued by John C. Kupferle, St. Louis, is known as the No. 7, and in it the publishers say that they have been very careful to list only such goods as are constantly carried in stock. The catalogue is a substantial cloth bound book, 10 x 7 inches in size. In the beginning is an alphabetical index, and the first articles noticed are shoe lasts; then come well wheels, hay fork pulleys, barn door hangers, clothes line reels, &c. A number of pages are given up to sad irons and other hardware, then lawn sprinklers, pump fixtures and foot scrapers. Among the goods in the catalogue in which our readers will be especially interested are sewer grates, cesspool grates, ventilating grates, cesspool and sash weights. The manufacturers particularly allude to the solidity of their goods, and mention that they have not lightened their patterns. They will be glad to mail this catalogue with price list to those who may apply for it.

HABERMAN MFG. COMPANY, Brooklyn, N. Y., manufacturers of stamped and enameled ware and tinware, have opened a spacious main office and sample room, occupying the first floor of the new building, 78 and 80 Beekman street, New York City. The firm's factories at Brooklyn and Berlin Village, L. I., are both in active operation.

T. F. AHERN & Co. of New Haven are putting up the metal ceilings and side walls in the store of ex-Mayor Sullivan's new building at Derby, Conn.

LALANCE & GROSJEAN MFG. COMPANY, 19 Cliff street, New York, favor us with their dairy goods department catalogue for 1895, a 36 page book, containing illustrated descriptions and prices of their L & G. milk cans in various patterns and milk can sundries. Special attention is directed to the L. & G. improved milk can stock, now illustrated for the first time. The last 12 pages are devoted to illustrations and particulars of milk kettles, pails, pans, buckets, dippers, strainers, measures, skimmers and other dairy requisites made by the firm in enameled ware and stamped and pieced tinware.



The Texas Foundrymen's Association met at Waco, Texas, on the 6th inst. The subject of convict labor formed the chief topic for discussion, and a committee was appointed to appear before the Legislature for the purpose of securing legislation which will prevent competition from the convict labor of the State with the Texas foundries. The same committee will also ask the railroads to grant cheaper freight rates upon raw material. The next regular meeting of the association will be held at Houston, Texas, May 8.

The Brooklyn Bridge trustees last week received a report from the committee on the terminal improvements, showing that the total expenditures for the work would be $2,041,913, which is over $300,000 more than the sum originally fixed on for the improvements. The expenditures include $321,327 for railway and equipments; car storage yard and real estate, $746,000; new Brooklyn station, $120,000; reconstructed New York station, $140,000; New York roadway, $107,600; cable drawing, $.92,227.69.

TIN PLATES.

Combined Tin Plate Shear and Doubler.

The accompanying cut represents a new combined shear and doubler with engine, built by the Wais & Roos Punch & Shear Company, Cincinnati, Ohio. The company, we understand, have been at work ever since the new industry of tin plate making had become an assured fact to get up a machine that would overcome all the inconveniences of the alligator patterns which had been in vogue in Europe for so many years. An inspection of the accompanying engraving will show what a simple and compact machine has been devised. The machine is illustrated with engine attached, but if desired it may be arranged for belt power. One of the principal features in its construction is that both the shear and doubler may be operated at one time or each independent of the other. The shear is the same as the latest improved gate patterns and is adapted to cut packs and trim tin plate, the knives cutting 36 inches in width. The doubler is driven by a crank from the same shaft that operates the shear and with the connection operates the toggle joints which produce a powerful though quiet running motion. The doubler opening is 28 inches wide and the head lifts about 8 inches, made adjustable by couplings having right and left threads, so that it is exactly parallel and enabling the operator to double either tight or loose as he may desire. Other advantages to which attention is directed are that it is not necessary for the operator to change position while doubling, hence he economizes time; the machine furthermore doubling very heavy metal. It is compact, takes up small space and requires a correspondingly small foundation. There are no obstructions, such as pit, cam shaft, &c., and the engine and gearing are also entirely out of the way. The manufacturers mention that the machine is made of the best material throughout, the table and working parts are adjustable and the engine, which is also adjustable, is 7 x 10 inches. When complete for shipment the machine is mounted on heavy oak skids with pipe connections all in place ready to turn on the steam, the weight being about 5400 pounds.

Combined Tin Plate Shear and Doubler.

Required Horse-Power for Tin Mills.

Opinions differ very much regarding the horse-power required to operate tin or sheet mills successfully, and ideas of correct construction are equally far apart. Bearing upon this question, some facts are presented in the shape of results obtained at the plant of the Morton Tin Plate Company, Cambridge, Ohio. The mills are three in number, 24 x 32 inches, all in one train, driven direct by a Hamilton-Corliss engine 32 x 60 inches. There are four return tubular boilers, 16 feet long, 66 inches diameter, each having 58 tubes 4 inches diameter. This steam power also operates three stands of cold rolls, 20 x 32 inches, driven by a 24 x 48 inch engine of same type. During the fourth and fifth weeks of operating this new plant, at a time when the thermometer registered 10° above to 12° below zero, although the steam pipe covering was not completed, the three mills turned out 212 tons of perfect plates. The maximum horse-power developed was 486. The maximum product of 240 tons would have been obtained but for the sickness of some skilled employees. The mills were built by the Leechburg Foundry & Machine Company, Pittsburgh, Pa.

SCRAP.

The Western Packers' and Canned Goods Association held their annual convention in Chicago last week. They represent an extensive interest in the tin plate trade, as they consume enormous quantities of tin cans in preparing their products for the market. Their sentiments with regard to American tin plate are, therefore, of much importance, especially when the fact is taken into consideration that the membership of the association is scattered

over an immense section of the West, in which the influence of manufactures and manufacturers is less directly felt than in the East. When the question of encouraging the establishment of American tin plate factories was first agitated, they were quite generally opposed to the adoption of such a policy, as they feared the effects upon their trade of an advance in the cost of tin plate which was expected. But as prices declined instead of advancing they changed their opinions, and are now overwhelmingly in favor of supporting the American tin plate industry.

The Wais & Roos Punch & Shear Company, Cincinnati, Ohio, are building a number of new machines for tinning, and have, we understand, several heavy contracts now on hand which have necessitated doubling their force in the factory.

At the plant of the American Tin Plate Company, Elwood, Ind., all the nine mills are running full time and to the utmost of their capacity, turning out about 6500 boxes of finished bright plate weekly. Over 600 hands are now employed at the works.

Announcement is made that a contract has been closed with Conner Brothers of Wabash, Ind., for the establishment of a tin plate factory at Converse in the same State.

The monthly statement of goods in the New York bonded warehouses shows that 7,294.929 pounds of tin plates, valued at $150,853, were so held on January 31, as compared with 8 511,-678 pounds, of the value of $171,010, on January 31, 1894.

The death is announced, at Elwood, Ind., on February 15, of George Banfield, father of Superintendent Banfield of the American Tin Plate Works, at the age of 80 years. The distinction is claimed for the deceased of having manufactured the first tin plate made in the United States, at McKeesport, Pa., in 1874.

Lewis Crater, Howard McIlvain and Charles A. High, all of whom are at present connected with the rolling mill of McIlvain & Sons, Reading, Pa., have organized a company to erect a tin plate plant in that city. The site, it is reported, has already been procured, and work will be begun upon the erection of the mill as soon as the season will permit. In the beginning they will not roll their own back plates, but will purchase them elsewhere, although later they may roll their own plates.

The plans are completed for the large tin plate plant of the Laughlin Nail Company, at Martin's Ferry, Ohio. The ground is being prepared and work on the foundation of the buildings is to commence as soon as the weather permits.

A number of tin plate workers formerly employed at Irondale, Ohio, have made a proposition to the Chamber of Commerce of Toronto, Ohio, looking to the erection of a tin plate mill at that place, provided a sufficient bonus can be secured to put up buildings and machinery.

The plans and specifications for the addition to be made to the New Castle Tin Plate Mill will soon be ready for exhibition to contractors.

The tin plate trade seems to have been as dull in Canada of late as it has been on this side of the border. Last week, according to *Canadian Hardware*, holders in Montreal have offered round lots of coke tin at $2.60, and it is believed that a buyer could have an order filled at $2.50 a box. Large stocks of plates are said to be held in Montreal.

The new tinning house under erection for some time by the Wheeling Corrugating Company, Wheeling, W. Va., is almost completed and will be put in operation some time this month.

Discouraged by the prospects ahead at home, a number of Welsh tin plate workers are reported to be on the eve of breaking up their homes and emigrating to this country.

Davis & Kelly, Columbia Building, Louisville, Ky., who are Southwestern agents for Ætna-Standard Iron & Steel Company, report good trade in tin and terne plates. The orders come from all parts of their territory, showing a good distribution of business.

The annual report of Thomas J. Dowling, State Commissioner of Labor Statistics, submitted to the New York State Legislature contains some interesting figures relative to the growth of labor organizations. In response to circulars sent out by the Commissioner last year, replies giving the information required were received from 689 labor unions and other similar organizations. These reported an enrollment of 155,303 names on their membership books. Compared with returns made by 580 unions in 1888, the Commissioner reaches the conclusion that there has been a steady, but by no means phenomenal, growth of labor organizations in the interval. The 580 organizations reporting then had 118,628 members. The figures given at either time are not, however, conclusive, as some associations throughout the State sent no returns and the statement does not include the membership of numerous mixed assemblies of the Knights of Labor and Federal unions affiliated with the American Federation of Labor. Making all allowances for these omissions, however, it is estimated that the actual membership of the labor unions in New York State cannot exceed 250,-000 people, a sufficiently small proportion of a working population which is more than 6,000,000. Mr. Dowling reports that "throughout all the labor organizations of the State there is a manifest unity of action to reduce the hours of labor to keep pace with the productivity of the machines."

Pennsylvania has at last begun in earnest the work enjoined upon its Bureau of Statistics, which was created by the act of 1874. Governor Hastings has appointed Capt. J. M. Clark of New Castle, a former newspaper manager, the secretary of this bureau, and Mr. Clark has entered upon the work with a will. He is visiting the towns of the State, advertising first in the local papers that he wishes to meet the mechanics of the town at the stated place, which has been procured beforehand. His object is to secure reliable statistics relating to the building trades, and he asks for the carpenters, stone cutters, masons, plasterers, painters and other mechanics to come to the meeting. He distributes blanks which ask the mechanic's opinion as to apprenticeship laws, and what he thinks of the industrial school, and a space is left for the mechanic's answers. The effect of machinery upon the hours of work and also upon wages is another of the questions asked, and the nationality of the workmen in the different industries of the State will be learned also; how many of them ever served as apprentices and for how long. The aim of the bureau is to secure information which will be of much interest and possibly of much value, both to the cause of learning and of labor. This is the first active effort made to make the State's Bureau of Statistics of any use or interest to the laboring men themselves.

Prof. Sylvanus P. Thompson, in his second Cantor lecture on the arc light, gave some interesting particulars as to its optics. Of the whole of the light generated less than 10 per cent. is delivered from the peak, and the crater might be regarded as a self-luminous area. It necessarily followed that the light given off is directly proportionate to the area of crater actually exposed to view, being greatest at an angle of 40 or 50°. Professor Thompson stated that an examination of the crater by the naked eye sometimes revealed a nebulous patch rather whiter than the rest, which seems to be in motion, and this, when examined by appropriate artificial means, is seen as a comma shaped object, which rotates round the crater at varying speeds, and not always in the same direction. Whether this was a real physical rotation of the flame or only an optical effect Professor Thompson did not commit himself to an opinion. Professor Thompson also pointed out that the arc as a transformer of energy into light gave an efficiency of only 20 or 25 per cent., the rest of the energy being transformed into heat. He demonstrated by experiment that the light from an alternate current is more equably distributed than from a direct current, but did not consider there was any difference of efficiency between the two if the same amount of energy were consumed under equal conditions.

In a furnace with stationary hearth erected at Anzin, France, to produce steel of extra welding quality for tube manufacture, the bricks for the burners and roof are made of magnesite, and special precautions are taken to prevent the accumulation of dust in the checker work by having straight passages without any projections. The chief feature of the process is the injection of cold air through the sides or roof, as well as the usual blast into the furnace to the extent of 5 to 15 per cent. of the weight of the air necessary for the complete combustion of the gas. The air jets are directed on to the metal bath by the use of inclined tuyeres, to lay bare the metal and to remove the glassy layer of slag or cinder from its surface, so as to facilitate oxidation. The air jets likewise cause an intimate mixture of the hot air and gas as they enter the hearth, and by so doing raise the temperature of the flame and direct it on to the surface of the metallic bath, the final result of the combustion being only slightly modified.

The recent impediments to ferry navigation between New York and Brooklyn, owing to ice on the East River, has drawn particular attention to the pressing need for ampler transit facilities between the two cities by means of more bridges. The present structure was only capable of accommodating the passenger traffic at the cost of extraordinary inconvenience to the public.

STOVE TRADE NOTES.

Cut Prices on Stoves.

The retail trade has recently been disturbed in certain sections of the country by cut prices on a few classes of stoves. The cuts which have been made are not of a character to influence much business at this time of the year. Dealers would not be disposed to lay in stocks now which would not be salable until next fall in order to take advantage of a slight reduction in price, which would be more than offset by the interest on the investment, cost of insurance, storage, handling, &c. It is in fact extremely doubtful if a very heavy cut would cause many stoves to move from manufacturers' hands into those of dealers. The latter would very likely be inclined to wait to see if prices would not go still lower by the time they were usually in the habit of placing their orders. This leads to the consideration of a special aspect of the case.

The most serious question called up by the cuts referred to is the menace which they present to the regular prices on standard stoves and ranges. Many dealers are asking manufacturers whether this is not the beginning of a general break in prices, and argue that the breach made in their hitherto solid front must go on until it involves the entire line. They are assured, however, that such is not likely to be the case. The great bulwark standing in the way of a general reduction is the wages paid in stove foundries. The leading item of cost in making a stove is labor. The price of pig iron was at one time exceedingly important, but that was when very high prices prevailed. In recent years pig iron has been so low that its variation in price has made but little difference in the cost of a stove from year to year. Labor, therefore, being the principal item, running from 75 to 90 per cent., is given the greatest consideration. Now the same rate of wages prevails in the general stove foundries as that existing in 1890, when everything was prosperous, No reduction has been even asked, because manufacturers could not see how that would make a bad condition of things better. It would not cause any more stoves to be sold and it would make their workmen discontented and perhaps the work then turned out would be less satisfactory, for poor wages usually means poor work. Paying the same rate of wages as in good times has actually raised the cost of stoves, because trade has been lighter and production smaller, thus concentrating general expenses on fewer goods, which has enhanced the cost of each. Stove manufacturers turning out full lines are thus realizing much smaller profits and in fact are extremely fortunate if they are able to make both ends meet at the close of such a year as 1894. They most certainly seem to be in no disposition to reduce prices on standard constructions.

A Rough Winter on Stoves.

An old resident of Dundee, Ill., who has kept a record of the weather for 57 years, states that the arctic weather of this winter has been the coldest for the longest period during that entire time. All kinds of heating apparatus have been tested throughout the West and Northwest as they never were before. Furnaces and stoves have been kept at their best, not merely for a few days at a time, but for weeks. Stove manufacturers can therefore reasonably expect that more stoves will be burnt out this winter than in any previous one. They can look forward to a largely increased trade in heaters next fall as a direct result of the terrific experience through which the country is now passing. A long succession of comparatively mild winters had bred the impression that the climate of the north temperate zone was gradually changing and that ere long its name would have to be altered to the north semi-torrid zone. That impression, however, has been rudely dispelled, and there are many people who would now vote in favor of naming it the north semi-frigid zone. It can safely be assumed that the possibilities of winter weather are now more thoroughly understood than ever before by this generation of housekeepers, and greater care will be taken next fall in making preparations for the reception and entertainment of Jack Frost.

Among these preparations will be the thorough overhauling of stoves and additions to their number, so as to heat extra rooms which were uninhabitable during a large part of this winter. Dealers who are forehanded will make their arrangements accordingly by ordering in ample time so as to get precisely what they want. There are few manufacturers with the money or the nerve to pile up great stocks of all kinds of stoves, when some kinds may not be called for to any extent. The stocks made up will be of such stoves as manufacturers think will be most salable.

Dealers who delay placing their orders until late in the season will then probably have to take what they do not want. Our readers may think this advice premature, as the buying season for next winter is remote, but the subject is one of sufficient interest and importance to be carefully kept in mind.

Death of Secretary Thomas.

At the moment of going to press news has reached us of the death of Secretary D. M. Thomas of the National Association of Stove Manufacturers, which occurred at noon, Thursday, February 21. The funeral will take place on Monday, at 2 o'clock p.m.

Stove Repairs.

BY I. OPEN.

In a short time the use of stoves for heating purposes will be dispensed with, and there is no better time to have them overhauled and put in order than when they are taken down and stored. Oftentimes this work is done by the householder, and he is not a little annoyed if he attempts to secure some repair for his stove by having to make one or two journeys to his dealer before the information is obtained by which the correct articles for repairs can be ordered from the manufacturer. If during the spring and early fall dealers in these goods would take the trouble to prepare a series of letters or articles for their local papers treating on this subject, the benefit that would accrue to the dealer would more than pay for the trouble taken. One subject that could be treated at some length is the damage that is incurred during disuse. The average person well knows that stove pipes, stoves and furnaces are more likely to rust out when connected with the chimney during the summer season than if disconnected from the chimney. They should be thoroughly cleaned and the smoke pipe either wrapped with paper or in some other way prepared to withstand the summer season. A large dealer in stove repairs in one of the great cities has been endeavoring to get some of his customers to follow his suggestions, and is surprised to find that they are not acted upon by his trade. Occasionally making a trip and having a large acquaintance, he has visited the local newspapers and investigated their willingness to print such articles in their papers if furnished them, and reports that he has met with no refusal. A letter bearing the signature of a local dealer, giving information how to order stove repairs correctly, will be read in the local paper with benefit to all

New Oil Burner.

A new fuel oil burner for domestic use has been invented by Simeon Stewart and Homer Carnes of Lima, Ohio, which is highly extolled in local journals. Stove oil, a low grade of refined petroleum, is used. It is kept in the basement and forced through the feed pipe by compressed air. The pipe is coiled in the stove, and the oil in passing through it comes in contact with the flame and is heated into a gas. Through two holes, not larger than pin points, the gas escapes into the stove into mixers where, at the point of combustion, it unites with superheated air in producing an intense flame. It is stated that there is no perceptible smell and the combustion is so perfect that every bit of soot is consumed. The best feature of the burner is the small expense it takes to operate it. A gallon of oil, costing less than 4½ cents, will run the stove ten hours. W. J. Broome of Lima has secured the sole agency, and has already completed arrangements for the manufacture of burners and tanks on a large scale.

Consumption of Gas for Heating.

One of the New York dailies gives the following account of the use of a gas heating stove as related to a reporter: "A gas stove is an unalloyed blessing, provided"—and the speaker paused suggestively. "Provided what?" "Provided you do not buy the stove from the company who are furnishing your house with gas at that particular time." "I have evolved this theory from personal experience," the gentleman continued, "and don't object to giving the details. Some time ago I bought a gas stove for my sitting room. There was a furnace in the house, but we thought the stove would be cheery and bright and an addition to the comfort of the family circle. It proved satisfactory in every respect, but the gas bills far exceeded our wildest anticipations. From the time that stove came into the house the bills gathered in size and weight until they were positively staggering. I stood it as long as I could, and then I sent and asked the gas company to come and take away the stove, that I might regain my peace of mind. I did not complain to them of the bills, I simply told them that I didn't want the stove any longer. They took it away. Then, wishing to try an experiment, I went to another company and bought me another gas stove, if anything larger than the first. This stove was introduced into my house without the knowledge of the gas company who supplied the gas, and the bills were one-third smaller. I have never pretended to account for this eccentricity on the part of the little instrument that registered the gas used. I simply relate the facts."

Gas for Cooking.

Aside from the convenience of gas for cooking the cost is a matter of interest. It is a common assertion that gas for household cooking is as cheap or cheaper than coal, and in one department of hotel cooking experience corroborates it. In one of the oldest and best hotels on lower Broadway, New York, the charcoal broiler was replaced by a gas broiler, and the patrons at once noticed that they were served quicker, claiming their steaks and chops must have been cooked in advance, though no fault was found with the quality or flavor. Some of those who were well acquainted with the proprietor had the pleasure of visiting the kitchen and watching the broiling as done by gas. A saving of about five minutes in time was reported. During one of the celebrations in New York at the time of the naval display, over 3800 pounds of steaks and chops were broiled by the gas broilers during 14 hours of one day. The broilers have six compartments, each accommodating one wire broiler about 15 inches long.

At another large hotel further up town two charcoal broilers, each 3 feet long, were replaced by gas broilers, and after a careful watch for some time a difference in the cost of fuel of $1.80 per day was shown in favor of the gas broiler. In some of the larger banks in New York a complete kitchen and restaurant is run for the employees and gas is used exclusively for fuel for boiling, broiling, roasting, and heating water.

ODD PLATES.

The Standard Lighting Company of Cleveland, Ohio, have found it necessary, owing to their rapidly increasing business, to enlarge their factory, and have let contracts for an addition to their present works which, when completed, will give their plant a frontage of 400 feet and a depth of 150 feet and will be three stories high. This new space will be largely devoted to the manufacture of gas stoves, making theirs the largest vapor and gas stove factory in the world.

The Reading Stove Works of Reading, Pa., have recently received a large order for ranges from Rotterdam, Holland. A local paper states that it is the general opinion that this demand for American stoves is the outcome of the efforts of the Philadelphia & Reading Coal Company, whose agent was sent abroad some time ago with sample stoves and anthracite coal for the particular purpose of introducing the latter. It is stated that the ranges to be sent to Rotterdam will be equipped with the same style of grate as that in use in this country.

At the annual meeting of the stockholders of the Canfield Stove Company, held in Kingston, N. Y., on Monday, February 11, the following were elected directors for the ensuing year: P. A. Canfield, V. B. Canfield, M. B. Canfield, J. M. Holmes, M. G. Holmes. The following officers were elected: V. B. Canfield of East Orange, N. J., president; M. B. Canfield, vice-president; P. A. Canfield, treasurer and manager; M. G. Holmes, secretary.

The Detroit *Free Press* recently published a detailed description of the magnificent steel yacht now being built by the Detroit Boat Works for Commodore Merrill B. Mills, treasurer of the Michigan Stove Company and also heavily interested in other stove companies. It is to be larger than any yacht thus far launched on the great lakes west of Cleveland, but will surpass all others on the lakes in the perfection of its appointments and in speed. The contractors promise a speed of 18 miles an hour. The length over all will be 132 feet, water line length 110 feet, beam on deck 17 feet 6 inches, and molded depth 8 feet 9 inches. The propelling power will be a triple expansion engine with 10, 16 and 26 inch cylinders by 6 inch stroke. The machinery is to be built to develop 250 horse-power. The interior will be lighted by electricity. The boat will represent an investment of $70,000 when completed, which is to be before July 15. Mr. Mills has attained high rank in yachting circles, his title of commodore having been regularly obtained by election to that position in the yacht club of the lakes.

The Joseph Bell Stove Works at Muncie, Ind., which had been idle for several weeks making extensive repairs, resumed work about the 1st inst.

The Fuller & Warren Company of Troy, N. Y., have issued a unique announcement calling attention to the merits of their Stewart ranges. It is in the shape of a doctor's prescription and gives the ingredients as food, water and fuel. Of the latter only a small quantity is required, while the results are given as "XLEnt." It is intimated that if the Stewart range is used regularly in the family it will prevent that tired feeling so often experienced by housekeepers. The directions accompanying the prescription are as follows: "Three times daily, before meals. Shake well before using."

The Great Western Stove Company of Leavenworth, Kan., resumed operations on the 5th inst., after having been shut down for over two months during the dull season. They expect to continue in regular operation from this time forward.

The office and warerooms of the Sill Stove Works have been removed to the office and warerooms of the Chicago Stove & Range Company, at 68 and 70 South Canal street, Chicago, Ill., one block north of the Union Depot, and on the corner of Madison and Canal streets.

A. L. Russell will represent the Danville Stove & Mfg. Company, Danville, Pa., with headquarters at 41 North Eleventh street, Philadelphia, Pa., and will travel in the States of New Jersey, Delaware and Eastern and Southeastern Pennsylvania. The company have this year added a new line of furnaces and four-hole ranges to their already large and varied line. They have secured the Eastern agency for the Monarch gasoline and gas stoves for Pennsylvania, New Jersey, New York and New England States, and have distributing depots at 41 North Eleventh street, Philadelphia, and 284–286 Pearl street, New York City.

John D. Green, the late manager of the Superior Stove Works, at Superior, Wis., has accepted a position with the Detroit Stove Works, and will travel over Southern Michigan and Northern Indiana. The principal owners of the Superior Stove Works are disposed to put them in operation as soon as practicable, and will probably make a start about April 1.

According to Government statistics just issued, our exports of stoves and ranges during 1894 attained a value of $240,936; against a value of $235,796 in 1893 and $205,348 in 1892. Our export trade thus shows growth, although it is not at a very rapid rate.

The National Vapor Stove & Mfg. Company of Lorain, Ohio, have effected a reorganization and are now ready for business.

The Peck-Williamson Heating & Ventilating Company of Cincinnati, Ohio, announce that they will open a branch house at Webster City, Ia., making it a distributing point for Iowa, Nebraska, the Dakotas, Kansas and

Minnesota. This firm have a branch house at Dayton, Ohio, one at Pittsburgh, one at Chicago and one at St. Louis. E. R. Swan will be the manager of the Webster City house.

ORSON WILSON, 199 Broad street, Newark, N. J., is selling a new draft regulator for cooking stoves. It is a casting designed to take the place of a cover and is a large register which, when open, admits air to check the draft. Satisfactory results are reported from its use.

AT THE ANNUAL MEETING of the Peninsular Stove Company, held at Detroit, Mich., a few days ago, William B. Moran was elected president for the twelfth consecutive term.

JOSEPH P. MITCHELL, at one time president of the Stove Molders' Union in Troy, died of consumption on Friday, February 8, at the age of 67 years. His death occurred in Utica, N. Y., to which place he moved about ten years ago, where he was foreman in one of the stove works.

EDWARD GRIFFITHS POWELL, vice-president of the Gobeille Pattern Company, Cleveland, Ohio, died in Kansas City February 10. Mr. Powell was born in Ohio in 1841, and served through the war, being twice severely wounded. At the close of the war he embarked in the cattle business, in which he was very successful, and was well known in this line through the South and West. While Mr. Powell did not take a very active part in the management of the Gobeille Pattern Company, he was very much interested in their success. When he died a friend said of him, "the business world lost an honest man," and this short eulogy, when truly merited, covers the highest praise.

THE ENTERPRISE STOVE COMPANY of Vincennes, Ind., recently broke ground for an additional warehouse, which has been made necessary by reason of the demands of the trade and the lack of room for advance storage.

A NEW ORGANIZATION was recently formed (?) in Cincinnati, Ohio, during the convention of manufacturers, to be known as the Plumbago Club, the following officers having been elected: J. S. Hibbs, representing J. W. Paxson & Co., Philadelphia, president; J. D. Smith of the J. D. Smith Foundry Supply Company, Cincinnati, Ohio, vice-president; H. F. Frohman and T. L. Griffith of the S. Obermayer Foundry Supply Company, Cincinnati, secretary and treasurer respectively. The principal object of the club being the enrollment of members whose veracity will pass unimpeached insures the strictest surveillance of the past record of any proposed candidate. Another clause in the by-laws and constitution adopted by the new organization is that no greater discount than 75 and 50 and 50 and 10 per cent. be allowed on any material sold. It is perhaps needless to state that this will meet with unanimous approval. After a protracted session reaching into the small hours, the first meeting closed with the understanding that another be held at the same place the last Saturday in February.

THE PENINSULAR STOVE COMPANY of Detroit, Chicago and Buffalo are distributing a circular illustrating the Peninsular wrought steel ranges for 1895. This is a completely new line which the company have brought out, and the goods are offered in any style, size or combination desired for private houses, restaurants, hotels and public institutions. The ranges are constructed o cold rolled wrought steel, are asbestos lined throughout, and the grate can be withdrawn without removing a single plate or bolt. The circular illustrating the goods is printed in colors, and the illustrations are accompanied by full descriptive particulars.

Trade Notes.

THE CINCINNATI STAMPING COMPANY, Cincinnati, are directing attention by means of an advertisement elsewhere in this issue to the Robinson World's Fair Steam Cooker. They refer to the fact that it can be used on any kind of stove with economy and advantage, and that it cooks an entire meal at one time, using but one fire, and that it is especially adapted for gas or gasoline stoves.

AMONG recently authorized corporations in Illinois are the following: Edgecombe Sash Balance & Lock Company, Chicago; capital stock, $100,000; incorporators, Charles H. Edgecombe, William J. Titley and Ernest Uhlich, Jr. Illinois Stamping Company, Chicago; capital stock, $40,000; incorporators, Charles D. Milne, Carlos A. Miller and Mendeville J. Barker. The Monarch Cycle Mfg. Company, at Chicago; capital stock, $500,000; to manufacture bicycles; incorporators, Chandler Robbins, John W. Kiser and John S. Emmert. Phœnix Telephone & Mfg. Company, at Chicago; capital stock, $100,000; to manufacture electrical apparatus; incorporators, Lee R. Brown, E. E. Yaxler and J. H. Biley.

THE AFFAIRS of the McCullough Iron Company, whose main office is at Philadelphia, have been placed in the hands of receivers, and the Girard Life Insurance, Annuity & Trust Company of Philadelphia and Henry Whiteley have been appointed and duly qualified as such. The company announce in a circular that the assets are far more than sufficient to pay off all liabilities in full in the course of time. Under the orders of the court the receivers will continue to operate the different works of the company for the present. Two days after the McCullough Iron Company passed into the hands of receivers their representatives in Philadelphia, the McDaniel & Harvey Company, made an assignment to the Girard Trust Company and Henry Whiteley. In their circular they state that the interests of the two companies were so intimately interwoven that the assignment was made as a matter of protection and precaution, to protect the interests of stockholders and creditors. The assets of the company, the circular states, are ample and much in excess of all liabilities, and creditors will be paid in full. The McCullough Iron Company are proprietors of the following works: North-East Forges, North East & Shannon Mills, at North East, Md.; Minquas Mill, Wilmington, Del.; West Amwell Mill, Elkton, Md.; Octoraro Mill, Rowlandville, Md., and the Charbon Chemical Works, North-East, Md. They manufacture Galvanized Sheet Iron extensively, also Bar Iron, their specialty being Harvey's patent cleaned Sheet Iron. The officers of the two companies are Henry Whiteley, president; Enoch McCullough, vice-president, and Huxley Harvey, treasurer.

THE ANNUAL MEETING of the stockholders of the Novelty Stamping Company, Bellaire, Ohio, was held recently and the result of the year's business was reported as being very satisfactory, although no dividend was declared. The capacity of this concern for the manufacture of railroad and tubular lanterns, stamped ware and sheet metal specialties has recently been doubled, the firm having added to their equipment a No. 14 Bliss press, at a cost of $5000. At the present time the firm have sufficient orders on hand to guarantee steady operations for the next six months.

A. MUGFORD, Hartford, Conn., has reported plans for the enlargement of his electrotype foundry, which will double his capacity in this branch, besides adding to his facilities for wood engraving, designing and printing. The alterations will be begun at once and completed as soon as possible.

POPE'S ISLAND MFG. CORPORATION, New Bedford, Mass., have just completed a new rolling mill plant for the production of their Howard non-corrosive metal, which is largely used by jewelers, metal spinners and metal workers in general.

It is said that the United Mine Workers have decided to withdraw from the Knights of Labor and reorganize on their own account. Such a movement would seriously cripple the Knights of Labor and might lead to the secession from that body of other important associations.

Out of the 27 strikes that occurred in the State of Pennsylvania last year only three were successful.

There has lately been introduced at Havre, France, a new type of steam vessel for river traffic in which the power for the propeller is obtained from a gas engine. "L'Idee," one of the first of these boats, is of 350 tons, and is driven by a vertical gas engine of 40 horse-power. The smallness of the room taken up by the engine and the ease of manipulation are referred to as the principal recommendations for the use of gas engines on shipboard. A syndicate has been formed in France for building marine gas engines.

The engineering committee of the Ohio and Lake Erie ship canal have appointed Geo. W. Lehman of Philadelphia to direct the preliminary surveys. He will have charge of the three surveying parties.

Western coal was offered in carload lots at $1.10 a ton, on the tracks, at Chicago last week, the lowest price touched since the coal war began.

The National Lead Company have declared their usual quarterly dividend of 1¾ per cent., payable March 15.

The Montreal (Can.) Chamber of Commerce are making an effort to establish a commercial museum in that city.

The J. H. Vogan Car Works of New Castle, Pa., have just completed a handsome street car for the Second avenue, New York, line, and the Conelly Gas Engine Works of New Castle have equipped the car with a gas motor. The agent of the company is now in New Castle to inspect the motor and car, and inside of a week it will be tested on the track of the New Castle Street Railway Company.

TRADE REPORT.

The Iron Market.

In spite of the continued low prices of Iron and Steel products, a more hopeful feeling is spreading among Eastern manufacturers. This is due principally to the fact that costs have been steadily crowded down, until now makers feel that they are partly safe in their own territory. This applies to Pig Iron as well as to Steel. In the latter the basic open hearth furnace has become the salvation of the Eastern maker. Pig Iron for this purpose is being delivered at a low price, while cheap Melting Scrap has been available in quantity in their territory. The result is that with modern improved practice Basic Open Hearth Steel can be produced in the East at a cost very close to the price at which Western and Bessemer can be laid down in Eastern markets. This is a phase of recent development which has inspired so much confidence that considerable improvements in rolling mill and Steel plant are either under way or are in contemplation. The trade will watch these developments with keen interest, and will divest itself of the impression, too widely prevailing, that a decadence is progressing in a section which is in reality securing a new lease of life.

It has transpired that the recent large sales of Southern Foundry Irons in the Chicago district were secured only by receding from the prices which leading Southern makers have clung to for a considerable time. There has been a fair distribution from Cincinnati.

The advance in the prices of Wrought Iron Pipe seems to have had the usual effect of causing buyers to test the sincerity of sellers by keeping out of the market.

In metals an advance in Tin is noted. Copper is weaker, while Lead has declined under the pressure of moderate sales.

Pig Iron.—The volume of business continues light in New York City and its tributary district. Consumers are shopping closely and show no hesitation in backing out of orders when bargains are offered to them by other sellers. We quote $12 @ $12.50 for No. 1; $11 @ $12 for No. 2, and $10.50 @ $11 for No. 2 Plain, standard brands, tidewater delivery. Southern Iron, same delivery, is selling at $11.25 @ $11.50 for No. 1; $10.25 @ $11 for No. 2; $10 @ $10.50 for No. 3; $10.25 @ $10.75 for No. 2 Soft, and $10.50 @ $10.75 for No. 1 Soft. Foundry No. 4 (Foundry Forge) is $9.50 @ $10.

Philadelphia advices indicate that a fairly good demand for Pig Iron has been met with in that market and at inside prices there is no difficulty in placing liberal amounts of material. Ordinary Irons for pipe founding, &c., are wanted at about $10, some sales having been made at that figure for water delivery, rail deliveries being held at a trifle more money. Good No. 2 Foundry X is taken at $11.25 @ $11.50, although for some brands $11 has been accepted for what is said to be a strictly first-class article. There is nothing in the immediate outlook to indicate any special change in either price or demand. Sales have been in moderate quantities at about the following prices for Philadelphia, and from 20¢ to 30¢ less for water delivery, or at points such as York, Harrisburg, &c.:

Standard No. 1 Foundry X	$12.00 to	$12.50
Standard No. 2 Foundry X	11.00 to	11.50
No. 2 Plain	10.75 to	11.00
No. 1 Soft	11.50 to	11.75
No. 2 Soft	10.75 to	11.00

Local Pig Iron has again taken the lead in sales in the Chicago market. One order was placed for 2000 tons and quite a number of others for smaller quantities. Consumers are pushing for deliveries as much as ever. Sellers of Southern Iron state that the business in sight for them has been cleaned up for the present and inquiries are now being received. The large sales of Southern Coke which were recently made here were closed at cut prices by furnace companies which have hitherto maintained a firm front. Ordinary quantities are held at our quotations. Lake Superior Charcoal has moved in carload lots only. Quotations are as follows for cash:

Lake Superior Charcoal	$13.00 to	$14.00
Local Coke Foundry, No. 1	10.25 to	10.50
Local Coke Foundry, No. 2	9.75 to	10.00
Local Coke Foundry, No. 3	9.50 to	9.75
Local Scotch	10.50 to	11.00
Ohio Strong Softeners, No. 1	12.50 to	13.00
Southern Silvery, No. 1	11.50 to	11.75
Southern Silvery, No. 2	11.25 to	11.50
Southern Coke, No. 2	10.00 to	10.50
Southern Coke, No. 3	9.75 to	10.25
Southern, No. 1, Soft	10.25 to	10.50
Southern, No. 2, Soft	9.75 to	10.25
Alabama Car Wheel	17.50 to	18.00
Jackson County Silvery	15.50 to	16.00
Other Ohio Silvery	14.25 to	14.50

There is considerable difference of opinion just now as to the prices on Iron in the Pittsburgh district for the second quarter of the year. Some in the trade believe that there will be an improvement in the second quarter, while others, equally well informed, hold the opinion that while the present heavy production is maintained there is very little chance of prices showing improvement. Foundry Irons continue in light demand and prices are unchanged. We quote as follows:

No. 1 Foundry	$10.50 to $10.65 Cash.
No. 2 Foundry	9.65 to 9.75 "

The past week in the Cincinnati market has not been marked by any large transaction in Pig Iron, and prices have continued low, but there has been a fair run of small orders ranging all the way from car lots to contracts for 600 tons, and in the aggregate from 12,000 to 15,000 tons have been distributed, and the business is widely scattered. It is certainly evident that there is a revival among manufacturing industries, but the recuperation is so gradual that it is scarcely perceptible from day to day, and it is only when the volume of business for different periods is contrasted that the improvement is realized. On the whole, the outlook is more encouraging, the weather being more favorable and recent developments gratifying. Quotations are given as follows:

Southern Coke, No. 1	$9.75 to	$10.00
Southern Coke, No. 2	9.00 to	9.25
Southern Coke, No. 3	8.50 to	8.75
Ohio Soft Stone Coal, No. 1	14.50 to	15.00
Ohio Soft Stone Coal, No. 2	14.00 to	14.50
Lake Superior Coke, No. 1	11.75 to	12.25
Lake Superior Coke, No. 2	10.75 to	11 50
Hanging Rock Charcoal, No. 1	16.00 to	16 50
Hanging Rock Charcoal, No. 2	15.50 to	16 00
Tennessee Charcoal, No. 1	13.00 to	13 50
Tennessee Charcoal, No. 2	12.00 to	12.50

In the St. Louis market the local consumption is reported as showing a fair increase, and the demand is of a more satisfactory character than it has been for some weeks. Prices, while they do not improve, maintain a fairly steady front and are not being shaded to any extent. No. 2 Foundry is quoted at $6.76, f.o.b. cars Birmingham, and this price is not shaded, with the exception of one furnace, who are cutting the price about 10¢ ℔ ton. The fact that this furnace is in the hands of a receiver explains the price. There is no large business being placed, but the general market is kept active by the number of small sales, which vary from a carload to 400-ton lots. We quote as follows for cash, f.o.b. cars St. Louis:

Southern Coke, No. 1 Foundry	$10.00 to	$10.25
Southern Coke, No. 2 Foundry	9.50 to	9.75
Southern Coke, No. 3 Foundry	9.00 to	9.25

Metal Market.

Pig Tin.—The strained conditions under which Straits Tin for spot delivery was made to command an unusual premium over prices at which current month deliveries were sold and freely offered, gave place to a more normal state of affairs early in the week. This resulted partly from more liberal arrivals, giving ample supplies, and relaxation of force by holders of other supply. More recently prices have advanced somewhat owing to livelier buying on speculative account, particularly for March and June delivery, and freer movement of Tin into the channels of consumption since the down turn in spot prices. There is nothing in the general statistical position that would appear favorable to a much higher level of values, since stocks are still large and the movement from the Straits quite liberal. Shipments thence during the first half of February included 350 tons to the United States, 1200 tons to London and 850 tons to the Continent, against a total of 1875 tons in the corresponding period of last year. Straits Pig in small retail parcels is quoted at 15¢ @ 15½¢ ℔ lb, the lower figure being the most common.

Copper.—The weakness of the market noted in our last report has been illustrated this week in a reduction of price by the Calumet & Hecla Company—a reduction, moreover, that was not accompanied by the customary report of more or less heavy business having been consummated. Other evidences of weakness exist in the fact that producers generally have used more effort to secure business, and in some instances shaded the popular quotation to facilitate matters, with results that are easily measured. Evidently home consumers have settled down to buying only as their requirements dictate, and the export outlet is not all that could be desired. Foreign market requirements are, in fact, filled to a considerable extent from stock

consigned by some of the mining companies. Later in the week a somewhat better business was reported in moderate amounts for home consumption. Jobbers' price for small lots of Lake Ingot from stock is about 10¼¢ ℔ lb

Sheet Copper. — Dealers report a better inquiry for Cornice Copper and orders also show a slight increase. As a whole, business compares favorably with that of last year at the same season, and the outlook for a good trade in the spring and early summer is thought to be favorable. Sheet Copper in small lots is quoted by jobbers at 14¢ ℔ lb, net.

Pig Lead.—At the opening of the week the market was extremely quiet and without any change. Spot stock was held at last week's premium, and futures were virtually neglected at old rates. In the middle of the week, however, the scene changed, with considerable offerings at the lowest recent prices. Thia weakened the market, but did not stimulate business to any degree, sales being atill unusually light and inquiry tame. American Pig in small lots from store is unchanged in price, jobbers quoting 3½¢ @ 3¾¢ ℔ lb.

Spelter.—Dealings have been very moderate here, and the demand has not improved in the slightest degree. For a time offerings were more reserved, and sellers' figures placed a fraction higher, but latterly the selling pressure revived and the apparent improvement in values disappeared. Ordinary Western brands in small lots are quoted at 4¢ @ 4¼¢ ℔ lb; the usual premium being asked on fancy brands.

Sheet Zinc.—Little or no business is being done in this material beyond purchases of small jobbing lots for present consumption. Jobbers quote 4½¢ @ 4¾¢ per pound in 600lb casks, and 5¢ @ 5¼¢ for smaller quantities.

Antimony.—No improvement in the demand has taken place and the market is rather weak. Hallett's in small parcels is quoted at 8¢, and Cookson's at 9¼¢ ℔ lb.

Nickel.—Sellers' prices are 35¢ @ 40¢, according to size of order.

Tin Plate.—With the advent of milder weather the demand in this section has developed more life and strength, jobbers reporting a gratifying increase in spot business, which, in the aggregate, compares favorably with the business lately done. Individual orders, however, continue quite moderate in size, and but little is yet being done in future contracts, except in the case of Coke Tins. Canners are reported to have lately placed some substantial orders for deliveries extending into April, but holders of Plates are not anxious to close contracts for far ahead at present low prices, usually demanding a slight advance for deliveries beyond the current month. Production on the other side is likely to be much restricted by the closing down of a large proportion of the Welsh works. On the other hand, the productive capacity of American works is being weekly increased. Prices are weak, and recent arrivals have been free.

The condition of the British Tin Plate market is described in a special London cable dispatch of February 20, to *The Iron Age*, as follows: Tin Plate has been in somewhat better demand and a fair business has taken place. Buyers realizing that prices have reached bottom are more willing to place orders, and offered a slight advance where stock was urgently required. Business has been chiefly in Oil sizes for Russia. Quotations, f.o.b. Wales, are as follows:

Bessemer Cokes, IC 14 x 20	9/	@	9/1½
Siemens Cokes, IC 14 x 20	....	@	9/4½
Ternes, 20 x 28	18/	@	23/
Charcoals, IC 14 x 20	10/6	@	13/

Sheet Iron —The increase in inquiries for both Black and Galvanized Sheets for extended delivery, referred to last week, still continues, and considerable business has been placed. Some manufacturers are not disposed to book orders very far ahead at present prices. Jobbers' quotations for small lots of No. 27 Common Iron from store rule at about 2.65¢. Galvanized Sheets are inclined to weakness in price. Small lots are quoted at the discount of 75 and 5 % @ 75 and 10 % off. The failure of one of the largest producing firms during the current week and the stoppage of their mills will cause for the time being a considerable decrease in the output of Galvanized Sheets, which may tend to stiffen prices in the near future.

Chicago Report.

Scrap.—A large movement has suddenly taken place in Heavy Steel Scrap, caused by buying orders from a leading Pittsburgh Steel company. Other material is quiet. Dealers quote their buying prices as follows, Chicago delivery:

	Per net ton.	Per lb
No. 1 Wrought Scrap	$6.50	....
Machinery Cast	5.50	....
Malleable Cast	5.00	....
Stove Plate (free of burnt)	4.00	....

Zinc	...	2¼¢
Rubber	-	4 ¢

Anthracite.—The demand is excellent and dealers are pleased with the opportunity to work off their stocks instead of carrying them over into another season. Hence prices do not stiffen. Carload lots of 12 net tons or over are quoted as follows, although some concessions are now being made:

	Grate.	Egg, Sto. and Ch.
Chicago, Ill	$4.75	$5 00
Milwaukee, Wis	4.75	5.00

CONDITION OF THE

Hardware Trade.

ADVICES from the principal trade centers indicate that on the whole the month of February thus far has not been characterized by an important increase in the volume of business, a fact which is accounted for, to some extent at least, by the exceptionally severe weather which has prevailed, interfering with travel in many sections and in some putting a stop practically to any unnecesaary outdoor activity. In some lines, however, there has been a good movement, and some of our advicea indicate a trade which, under all circumstances, should be reasonably satisfactory. The low prices which prevail are an unpleasant feature of the situation, and in this regard there seems to be as yet little indication of a general improvement, and on several lines there is much irregularity and demoralization. Competition is very active, but many manufacturers recognize the fact that prices have reached a level at which it is the part of wisdom to refrain from making further concessions. Some of the jobbing houses are making earnest efforts to prevent undue cutting of prices by the wholesale trade, but with only a moderate degree of success, and prominent jobbers are offering some lines, which they use as leaders, at very low prices. On many goods, however, they are selling at a very satisfactory margin of profit, as prices to the retail trade have not on the whole kept pace with the decline in the prices at which they purchase the goods. The cutting on the part of the jobbers is, however, having a bad effect on the market as a whole. Quotable changes in prices are, however, few. There is some complaint in regard to collections. The course of the politicians in Congress in regard to financial matters meets with almost universal condemnation from business men and elicits emphatic expressions of disapproval.

Advices from Chicago.—Shelf Hardware has recovered from the shock of the blizzard week. Mails have been coming along satisfactorily and travelers have been able to make their wonted trips with some regularity. The volume of business has consequently regained much of its former proportions, but there is still plenty of room for improvement. Orders for future shipment of seasonable goods are falling off, as prices are steady and no fear exists of either scarcity of goods or higher cost. Steel goods are in smaller demand than in previous years. They will evidently be bought as needed instead of being contracted for in advance. The Bolt market is somewhat disturbed by cut prices which are being quoted for immediate acceptance. Tinware is an exception to the general course of the Hardware trade. It is in very good demand, showing that stocks have not yet been brought up to their normal condition An unpleasant feature of the trade just now is the slowness of collections. Money appears to be getting scarce in agricultural communities. Credits are consequently being scrutinized very carefully, and new customers are obliged to make a very clear showing to get liberal treatment. The volume of business as compared with a year ago is very much better. Manufacturing consumers in country localities are buying more freely, and the outlook continues to improve, but

prices keep very low and margins are discouragingly small.

Notes on Prices.

Wire Nails.—The Wire Nail market continues, as at our last report, in excellent condition, and prices are firmly maintained by the manufacturers. The mills are fully occupied with orders and report an excellent volume of business, including some large purchases by leading houses, the demand, however, being principally for lots of moderate size, the aggregate of which is large. The market in the West is, however, to some extent disturbed by exceptionally low prices which are quoted by two prominent Chicago jobbing houses, not only for shipment from stock but also from factory in carload or less than carload lots. The prices named are lower than the ruling factory prices at the present time, even in the largest lots, and it is maintained by the manufacturers that the Nails are being offered by these houses at lower prices than they purchased the goods. Relating to this matter we have the following communication from a prominent manufacturer of Wire Nails, in which it will be observed that he suggests that the trade purchase promptly Nails which are offered to them at these exceptional figures:

There is a "fight" on in Wire Nails between the jobbers of Chicago, who are offering Nails at a lower price than they can replace them for, and one of the parties is offering to the extent of a single carload only, to one buyer, Nails at a less price than he is paying for them to day. Manufacturers are holding prices firm at 90 cents Pittsburgh and Cleveland, $1 Chicago and $1.05 East St. Louis to largest buyers for immediate shipment. As a manufacturer, I advise purchasers to lay in all these low priced Nails they can get, as I look for a further advance very soon. With 130,000 kegs less capacity a month than there was last spring, why not? The question with the buyer will be, not the price, but "Where can I get Nails?"

Advices from Chicago.—The Wire Nail situation is unchanged, although strong efforts have been made to effect a settlement of the fight between the local jobbers. The manufacturers have plenty of orders and large inquiries are being received, but buyers will not close until they see whether the Chicago price is to be advanced. Meanwhile jobbers quote 95 cents to $1.05, Chicago, for lots of any size up to one carload, the lower price being made by two houses only.

Cut Nails.—The Cut Nail market continues quiet, without change in prices. Small lots from store are held at 90 to 95 cents. With the coming of spring weather manufacturers are anticipating a marked quickening in the demand, and refer to the fact that they will enter upon the season with considerably smaller stocks than usual.

Advices from Chicago.—Only a moderate volume of business is reported by manufacturers. They state that no expansion in their trade is to be expected until the building season opens throughout the Northwest. Jobbers continue to quote small lots from stock at $1.

Barb Wire.—The Barb Wire market is steady, with a good amount of business and many inquiries. Small lots from store in New York are held at $2.15 to $2.20.

Advices from Chicago.—Manufacturers are enjoying an improving trade, with larger shipments and better inquiries. The only thing lacking to make the situation entirely satisfactory is the low price still being quoted by some local jobbers. Prices are unchanged, small lots from stock selling at $1 65 for Painted and $2 for Galvanized.

Postal Scales.—Gilfillan Scale & Hardware Company, Chicago, are putting on the market the National Postal Scale and the United States Postal Scale. The National is sold to the trade at $24 per dozen and the United States at $21 per dozen, 30 days net, 2 per cent. off ten days.

Glass.—Jobbers complain of a lack of business, and there is a slight decrease reported in the number of American Glass factories in operation. The consumptive demand for Glass is limited, and at the present time there appears to be few if any orders of a speculative character being placed. It is understood that another meeting of the Western Window Glass manufacturers will be held to arrange for a further reduction in the production of Glass and to put prices on a better paying basis. Meetings of manufacturers in the past have had this object in view, but thus far they have not been able to come to an amicable agreement. The New York market for Glass in small lots is represented by the following quotations: Single strength, 85 and 10 to 85 and 15 per cent. discount; Double Strength Glass, 85 and 20 per cent. discount. The Plate Glass situation remains unchanged. Orders are for small quantities, so that the larger portion of the Glass made is being put in stock at the factories. It is understood that the new arrangement among Plate Glass manufacturers has not yet gone into effect.

THE SWARTS METAL COMPANY, 120 West Lake street, Chicago, have changed their name to the Swarts Metal Refining Company. The change has been made in consequence of the great demand for refining. This demand has been found to be so large that the company have concluded to do their own refining, and therefore thought the new name more explanatory of their business. The company have just issued a cloth bound catalogue giving a full description of the various kinds of metal which they handle. This comprises Genuine Edison Babbitt, Edison Babbitt, Nickel Babbitt, Engine Babbitt, Nos. 1, 2, 3 and 4 Babbitt; Solder, Stereotype Metal, Spelter, Bar and Pig Tin, Antimony, Pig Lead, Electrotype Metal, &c. These various kinds of metal are described and the compositions of the several alloys are given, with recommendations as to their special use. The company carry all kinds of metals for use of plumbers, tinners, roofers, hardware dealers, electrotypers, &c. They also conduct a separate department for handling scrap metals in lines relating to the alloys and metals previously mentioned.

AT PITTSBURGH last week a rule was granted on George S. Griscom, receiver of the Moorhead-McCleane Company, to show cause why the New York Life Insurance Company should not be allowed to obtain a judgment for $350,000 against the company. On November 6, 1886, Moorhead & Co. placed a mortgage of $350,000 on their property with the New York Life Insurance Company. Later the property was conveyed to the Moorhead-McCleane Company. When the bill in equity asking for the appointment of a receiver was filed, the New York Life Insurance Company were not made a plaintiff. The latter allege that no part of the mortgage has ever been paid, and in addition they have paid $1476.03 as premiums on the fire insurance to protect their interest in the mortgage. They ask to be allowed a judgment against the company for the amount of the mortgage.

MANUFACTURING.

Iron and Steel.

The arguments in the case of the Oliver & Roberts Wire Company of Pittsburgh against the Pittsburgh Wire Company were completed in the United States Circuit Court, at Pittsburgh, last week, but no decision has as yet been rendered. The case involves an alleged infringement on a patent rod mill.

At the Arethusa Iron Works of Geo. W. Johnson, New Castle, Pa., two sets of cold rolls and two hot mills are being added and new foundations are being put under the main building.

Furnace No. 2 of the Dunbar Furnace Company, which was blown in January, 1894, after being banked nearly two years, was blown out Saturday, the 9th inst., after the most successful run in the history of this furnace. Furnace No. 1 will be blown in at an early date.

The Illinois Steel Company and the tonnage men in the billet and converter department of their Joliet Steel Works have come to an agreement, and the mills will start up about March 1. These departments of the mills have been closed since January 1, on which date the old scale of wages expired and the company proposed a new scale with a lowering of the minimum to conform to the heavy fall in prices since January 1, 1894. This the tonnage men refused to sign, and the mill was closed. The settlement now made is on the company's terms, with the exception of a special price on certain work.

It is understood that the Shenango Valley Steel Mill, at New Castle, Pa., will soon be considerably enlarged. Its entire output is steel billets, of which it is now turning out about 700 tons per day.

At a meeting of the receivers and the creditors and stockholders of the Troy Steel & Iron Company it was agreed to the appointment of a committee by the chairman to ascertain and report upon some course by which the company can be released from their present difficulties.

The plant of the Western Iron & Steel Company, at Lake View, Wash., is ready for operation. This will be the second rolling mill on the coast.

The stockholders of the Maryland Steel Company held their annual meeting at Sparrow's Point, Md., on the 13th inst. The old board of directors was re-elected, as follows: L. S. Bent, W. C. Felton, Fred'k W. Wood, W. S. Franklin and R. K. Wood. At a subsequent meeting of the directors F. W. Wood was re elected president and Edw. M. Smith secretary and treasurer.

The new wire mill of the Carpenter Steel Company, at Reading, Pa., is rapidly nearing completion. Its dimensions are 45 x 80 feet.

It is said that the Missouri Furnace Company of St. Louis, Mo., are making extensive repairs and improvements to their plant, and expect to be ready to resume operations in 60 days. The furnaces have been idle since June, 1893.

Valentine Furnace at Bellefonte, Pa., has blown out. A scarcity of ore, caused by the bad weather and drifts, and the necessity of making a few repairs about the plant, were the reasons for the stop.

Carolina furnace, at Greensboro, N. C., built in 1892, has just blown in for the first time.

The strike at the Tudor Iron Works, East St. Louis, Ill., is still on.

The old Cambridge, Mass., rolling mill and foundry have been purchased by the Chelmsford Iron Foundry Company of Chelmsford, Mass., who will utilize the plant for the manufacture of structural iron.

The Blair Iron & Coke Company of Hollidaysburg, Pa., have passed out of existence, having been merged into the Cambria Iron Company of Johnstown, Pa. The concern formerly operated No. 1 furnace at Gaysport, Pa.

As already noted, the Elliott-Washington Steel Company, New Castle, Pa., are making some extensive improvements to their plant. A building 100 x 60 feet is being added, and in which will be located the annealing and cold rolling departments. In the cold rolling department four sets of cold rolls, 12 inches in diameter and 14 inches long, one set of trimming shears and one gang slitter are being added. In the annealing department a 5-ton annealing furnace and a 175 horse-power engine, furnished by the Buckeye Engine Company, Salem, Ohio, are being put in. It is also contemplated to add a Berryman feed water heater and pump. When all improvements now under way have been completed, this concern will have a capacity for turning out 24 tons of cold roll steel per week.

As announced in these columns some time since, the Sterling Steel Company, Pttsburgh, with works at Demmler, Pa., have commenced the erection of a rolling mill. It will be 60 x 112 feet in size, constructed of iron and steel, and the contract for its erection has been let to the Shiffler Bridge Company of Pittsburgh. The Frank-Kneeland Machine Company of the same city will furnish an 8 and 12 inch mill, and Westinghouse Machine Company of Pittsburgh a 200 horse-power engine, and Fischer Foundry & Machine Company, also of Pittsburgh, a 200 horse-power engine, and R. Munroe & Son of the same city a steam boiler plant of 500 horse-power capacity.

LABOR EXCHANGE.

Notices under this heading of reasonable length are inserted free of charge. Only those relating to employment are admitted. Write distinctly on one side of paper only, and do not use postal cards.

HELP WANTED.

First-class PLUMBER with a liceuse, to take charge of plumbing business in New York City. This is a grand opportunity to the right man. "B.," office of *The Metal Worker*, 96-102 Reade street, New York City. Feb. 23

A first-class PLUMBER, HOT WATER and STEAM FITTER; work will be more planning and iron piping; must have good refcrences, be temperate, and from New England; state age, married or single, and wages wanted. Wm. Nourse & Son, Newport, N. H. Feb. 23

HOW TO KEEP A STORE.

By S. H. TERRY.

406 PAGES, 5x7½ INCHES.

This book should be in the hands of every one interested in the selling of goods at retail. Among the subjects discussed are: The selection of a business; choice of a locality; buying a stock of goods; examining, marking and arranging goods; how to advertise; employment of clerks; selling for cash and credit; keeping accounts; expenses; copartnerships; losses by fire, theft, &c.; influences of social life on business; buying at auction; investment of profits; insolvency; business qualifications. Every branch of the retail trade is treated upon in a direct, business-like manner. It is a thoroughly practical book for merchants and clerks. **Price, $1.50.**

ROYAL

WASH BOILER HANDLE.

PATENTED.

We call the trade's special attention to the Royal Handle, being the cheapest and the most durable handle in the market, fully protected by a number of letters patent, and all manufacturers using the handle report that their trade on wash boilers has largely increased. Over 100,000 handles sold in our local trade last year.

The advantages gained by using the Royal Handle can be readily seen, as it far excels the old fashioned tin or iron drop handles in beauty and strength, fits the hand perfectly and is always cold and adds greatly to the general appearance of boiler. Manufactured only by

SECOND EDITION.

PRACTICAL HINTS

—ON—

JOINT WIPING,

FOR BEGINNERS IN PLUMBING,

WITH THIRTY-FIVE ILLUSTRATIONS.

43 PAGES. PAPER, 25c.

This book contains a reprint from *The Metal Worker* of two articles on the method of Joint Wiping, an operation calling for a very large degree of manual skill.

The first account is written by a practical plumber, and is illustrated from photographs faithfully representing the hands and tools when wiping joints in various positions.

The second account, by an expert joint wiper, is also illustrated from photographs and will prove of great assistance to learners.

Ample instructions are given on preparing the pipes previous to wiping the joints, with full descriptions of all tools and appliances used.

The pamphlet, in short, gives all the assistance that description of the work can furnish and is the most practical and complete account of joint wiping that has been published.

Sent, post-paid, on receipt of price, 25c.

DO YOU WANT A PERFECT BATH TUB?

THEN USE

"THE PURITAN ROLLED RIM."

PATENTED.

Since the introduction of Iron Bath Tubs there have been objections made to their height, they being very inconvenient to get in or out of; also, difficult to clean beneath them. We have overcome both these objections in the "Puritan" Bath.

In the first place, while retaining the full size inside, it is 8½ inches less in height from the floor to the top of the rim, thus making it very much easier of access.

In the second place, by using the floor flange we dispense with the objectionable feet and floor space underneath, and also give the bath a better means of support than can be obtained by feet, and presenting as it does a plain, smooth surface both inside and out, it can easily be kept clean, and when in position it has a neater and more substantial appearance than a bath on feet.

☛ THE BATH SETS INTO THE FLOOR ABOUT 2½ INCHES. We have these Baths fitted with a variety of Fixtures. Send for circulars.

WROUGHT STEEL SINKS

ARE DRAWN FROM A SINGLE SHEET OF STEEL, AND ARE SUPERIOR TO CAST IRON SINKS IN EVERY PARTICULAR; BEING LIGHTER, STRONGER AND MORE DURABLE. WILL NOT BREAK FROM HEAT, COLD OR ANY CAUSE WHATEVER. BEING LESS POROUS THAN CAST SINKS, ARE COMPARATIVELY ODORLESS, AND THEIR GREAT ELASTICITY AVOIDS THE BREAKAGE OF DISHES.

THE BOTTOM IS FORMED TAPERING TO THE CENTER AND THE OUTLET, SO THAT THE DRAINAGE IS PERFECT, AND ENABLING THE ATTACHMENT OF STRAINER AND PIPE MORE SATISFACTORILY THAN IS POSSIBLE WITH ANY OTHER MAKES.

We Are The Originators

Of the Wrought Steel Sink, and are in position to supply them in any style finish desired, and in many different shapes, at prices that will be named.

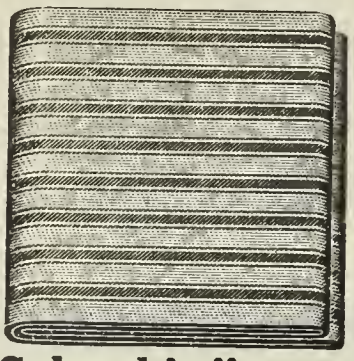
THE IRWIN & REBER PATENT

EXPANDING WATER CONDUCTOR.

MANUFACTURED BY THE

S. S. S. Conductor Co. LIMITED,

163 Lacock Street, ALLEGHENY, PA.

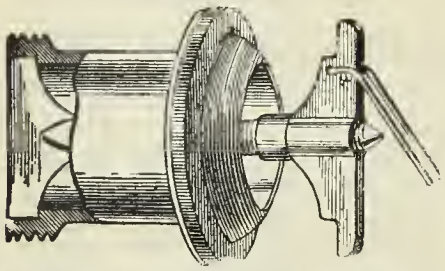


THE STANDING SEAM allows of an easy and secure fastening, keeping the pipe far enough from the wall to make any overflow from the eave pipe or head, run down the spout, and not the wall; and will open, in case of freezing, so as to prevent bursting, and still remain double-locked and water-tight.

Made in 6-foot lengths of a single sheet of SOFT STEEL.

GALVANIZED, KALAMEINED or LEADED.

The Irwin & Reber Expanding Water Conductor Pipe has been extensively used through the United States and Canada for the past ten years and has proved itself to be the best in the market. Send for Price-List.

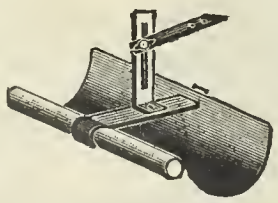


"Columbia" Wiping Cloths FREE!

Not free exactly from a financial standpoint (altho' very near it), but free from all defects due to **a Poor Quality of Ticking, Carelessness in Making and a Bungling Manner of Fastening the Ends.** A cloth free from the above defects is well worth the price we ask, 12 cents each, or six for 70 cents. Remember we make any kind—send us the size you want, giving the wiping edge first.

THE J. W. CHAMBERLAIN CO.,
Plumbing & Steam Fitting Specialties,
BANGOR, MAINE.

CLOSET REPAIR COUPLING.



(Patent applied for.)

MADE in two styles, to suit iron and lead pipe.
TAKES the place of the old spud and necessitates no change in fixtures.

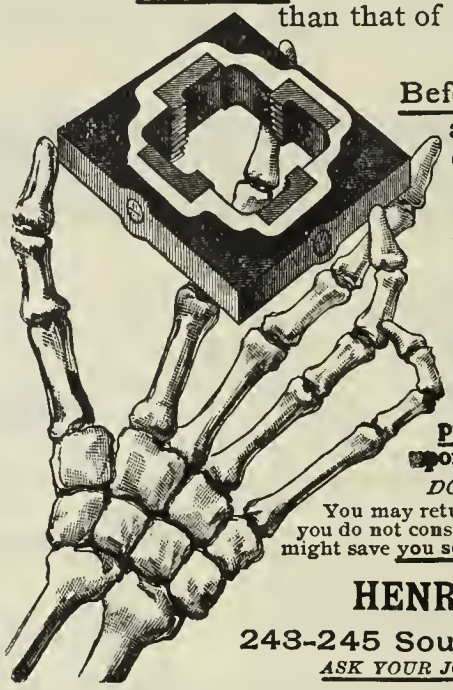
Mfrs. of Plumbers' Supplies,
229 Budden Street - - - PHILADELPHIA.

RICHMOND — E. T. HANGER. PATENTED.

TINNER, ATTENTION!

The cross-bar is hooked firmly to both sides of the trough. The slotted upright, with thumb-screw, permits instant adjustment to the requisite fall. It is never necessary to bend the suspending rod to suit pitch of roof. No obstructions to catch leaves and dirt, as in other adjustable hangers. **Save Time and Money.** Sample order freight allowed. For sale by first-class Jobbers. Manufactured by



JOHN SEVERDING, - - Richmond, Ind.

Maule's "Skeleton" Pipe Die

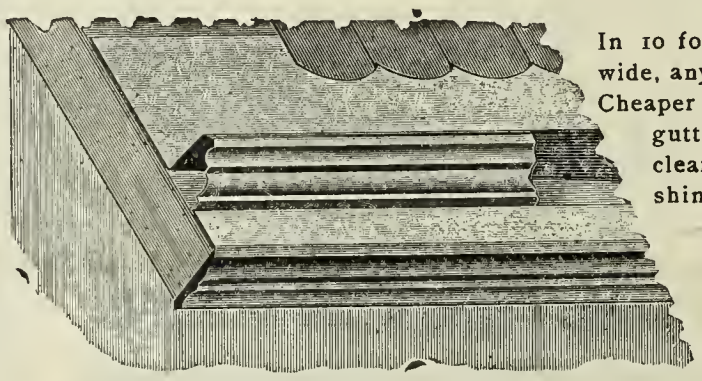
Two "Points" about it—only 2 (There are plenty more, but we only mention these two here.)

1

The First Cost to you of MAULE'S "SKELETON" PIPE DIE is less than that of any other Pipe-Threading Die—and

2

Before it becomes dull from use it will cut as many perfect threads as the best solid die extant, and when it is dull, you don't throw it away and buy a new one—Oh, no! You simply sharpen the cutters on a common grindstone, and so make it practically as good as it was at first, and this sharpening process may be repeated a number of times.



A sample One-inch "Skeleton" Pipe Die, either 2⅜ or 2½ x ¾ thick, by mail, postage prepaid, will cost you 62 cents, and will be sent upon receipt of a Postal note for that amount.

DO NOT SEND US ANY POSTAGE STAMPS.

You may return such sample to us, at our expense, if, after seeing it, you do not consider it worth the price. Don't the above sound as if it might save you some money—if TRUE?

Gummey's Anti Pin Hole Bright Tin Plate.

By permission of Messrs. Fieber & Holmes, Brookville, Indiana, we insert the following testimonial:

BROOKVILLE, IND., FEB. 1, 1895.

Messrs. GUMMEY, SPERING & Co.,
Philadelphia.

GENTLEMEN:

We have some Coffee Pots and Boilers made from your Anti Pin Hole Tin which have been in use over a year and only one of them ever came back for repairs. In this one case it had a flat copper bottom, and the *bottom* was worn out. We carefully examined the tin on the inside and could not see that it was eaten a particle This Boiler was a very large one for the County Poor Asylum.

Yours truly,

(Signed) FIEBER & HOLMES.

BEWARE OF IMITATIONS.

"BREVITY" MAY BE "THE SOUL OF WIT"—

But short pieces of tin do not make "TANDEM" CONTINUOUS ROOFING....

CUSTOMERS are told what to expect—and get it. In "TANDEM" they get a roll of good, prime tin, made of sheets 96 in. long, furnished either 14 in., 20 in. or 28 in. wide; and, if desired, THOROUGHLY WELL PAINTED.....

"TANDEM" is put on the market under no false pretenses. It is not a light weight tin; it is not made from 14 x 20 in. or 20 x 28 in. sheets—and IS NOT SOLDERED BY HAND.....

"TANDEM" Continuous Roofing Tin is made in IC and IX thicknesses. Primes and Wasters are sold separately. Before buying continuous roofing tin, be sure of what is being offered you in competition with "TANDEM".....

—ON—
FOUNDRY PRACTICE

The Encyclopedia of Founding and Dictionary of Foundry Terms,

used in the practice of molding. Together with a description of the tools, mechanical appliances, materials, and methods employed to produce castings in all the useful metals and their alloys, including brass, bronze, steel, bell, iron and type founding, with many original mixtures of recognized value in the mechanic arts. Also aluminum, plating, gilding, silvering, dipping, lacquering, staining, bronzing, tinning, galvanizing, britannia-ware, German silver, nickel, soldering, brazing, ores, smelting, refining, assaying, etc. By SIMPSON BOLLAND, Author of "The Iron Founder," "The Iron Founder" Supplement. 12mo.: cloth.....$3.00

The Pattern Maker's Assistant

Embracing lathe work, branch work, core work, sweep work and practical gear constructions, the preparation and use of tools, together with a large collection of useful and valuable tables. Sixth edition. By JOSHUA ROSE, M. E.; illustrated with 250 engravings; 324 pages: cloth.....$2.50

Modern Molding and Pattern Making.

A practical treatise upon pattern shop and foundry work. By JOSEPH P. MULLIN, M.E.: 257 pages; cloth; illustrated. $2.50

Iron and Steel Founding.

Illustrated with 39 diagrams. By C. WYLIE. Second edition, revised and enlarged; 324 pages; 8vo; cloth... .....$2

The Practical Brass and Iron Founder's Guide.

A treatise on brass founding, molding, the metals and their alloys, etc. By JAMES LARKIN, late conductor of the brass foundry department in the Penn Works, Philadelphia. A new revised and greatly enlarged edition. Contents: Among the most important and entirely new sections of this edition of this valuable and popular book are the following: Behavior of Metals and Alloys in Melting and Congealing; Malleable Iron Castings; Wrought Iron or Mitis Castings; Manufacture of Steel Castings; Casting of Brass; Casting of Bronze; Bell Founding; Chill Casting; Casting without Core; Casting on to Other Metals; Casting Iron and Other Metals Upon Lace, Embroideries, Fern Leaves and Other Combustible Materials; Some Modern Bronzes. In one volume; 12mo; 400 pages.....$2.50

American Foundry Practice.

Treating of loam, dry sand and green sand molding, and containing a practical treatise upon the management of cupolas and the melting of iron. By THOMAS D. WEST, practical iron molder and foundry foreman. Fully illustrated. Eighth edition, revised. 408 pages; cloth.....$2 50

The Iron Founder.

A comprehensive treatise on the art of molding, including chapters on core-making, loam, dry sand and green sand molding, also crystallization, shrinkage and contraction of cast iron and a full explanation of the science of pressures in molds, added to which are formulas for mixtures of iron, tables, rules and miscellaneous information. By SIMPSON BOLLAND. Illustrated with over 300 engravings. 12mo, cloth....$2.50

The Iron Founder Supplement.

A complete illustrated exposition of the art of casting in iron, comprising the erection and management of cupolas, reverberatory furnaces, blowers, dams, ladles, etc., mixing cast iron, founding of chilled car wheels, malleable iron castings, foundry equipments and appliances, gear molding machines, molding machines, burning, chilling, softening, annealing, pouring and feeding, foundry materials, advanced molding, measurement of castings, wrought iron, steel, etc. Also the founding of statues, the art of taking casts, pattern modeling, useful formulas and tables. By SIMPSON BOLLAND. Illustrated with over 200 engravings; 400 pages; 12mo: cloth..... ...$2.50

Mention this paper.

— "I was on a train, and near me sat an elderly woman, evidently from the remoter section of the country, with whom I got into conversation. She was ignorant, but of considerable native ability, and decidedly sharp of speech. She felt a strong aversion to politics and politicians, and was so vigorous in her attacks that I was forced to come to the rescue.

"'My dear madam,' I said in protest, 'I'm a politician.'

"'No, you don't say!' she exclaimed, looking at me with curiosity.

"'Yes, I do say it, and, what is more, I am a Member of Congress.'

"She actually threw up her hands in astonishment at this statement.

"'Well,' she said, 'I never would have thought it. And do you get paid for doing it?'

"'I certainly do. The salary is $5000 a year.'

"'Do tell," she exclaimed, 'Well, some men will do anything for money.'"—*Detroit Free Press*

— NOT BOSTONIAN.—Mrs. Parvenoo: "What are you going to leave us for, Priscilla? Aren't you satisfied with your job?"

Priscilla (the domestic from Boston): "It is not of my duties I complain, for they are not onerous. But your language is so full of solecisms and barbarisms that my nerves are completely unstrung."—*Philadelphia Record.*

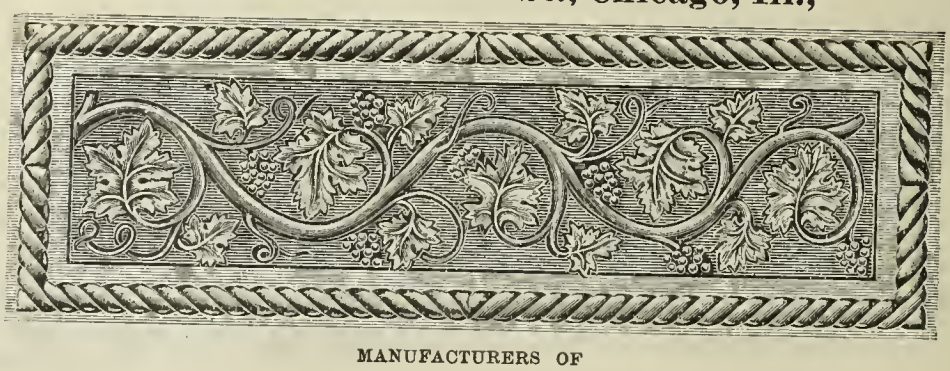
— A WITTY PRIEST.—Father Healy, the celebrated parish priest of Killiney, was a true wit. Mr. Balfour, while he was Chief Secretary for Ireland, once asked Father Healy if the Irish hated him as heartily as the newspapers declared they did.

"If they only hated the devil half as much as they hate you," said the honest father, "there would be no work left for us to do!"

Once he sent a sort of Mr. Malaprop to England to buy a horse for him.

"I did not buy him," said the man, on his return, "because he had a touch of the vernacular."

"Then you should have bought him," said Father Healy, "for he must have been a lineal descendant of Balaam's ass!" *Youth's Companion.*



— A DOG OF THE FOUR HUNDRED.—"Did you see the blind German and the dude dog?"

"Yes; but why do you call him a dude dog?"

"'Cause he leads the German. See?"

Show Windows Abroad.

"Europeans don't go in for newspaper advertising to anything like the extent that we do here," said an American recently returned from abroad to a New York *Sun* reporter, "but they take the shine right off Americans for original schemes to attract attention to their shop windows. In London, Paris and the larger cities of Belgium the shopkeepers are continually devising catchy advertisements. Shoe dealers, hatters, safemakers and men in the various mercantile lines do the business up best, but the confectioners, pastry men and other small merchants are not a long way behind them. A shoe dealer in Brussels, who makes a specialty of a waterproof shoe, keeps a pair of shoes standing in a pan of water in his window all day long. The water comes just up to the tops of the soles, and the public are respectfully invited at all times to step up and feel the inside of the shoes and see that they are perfectly dry. Another shoe dealer in London made a specialty of shoes for 'bus drivers, and his greatest claim for them was that they were unusually warm. He kept a pair of shoes imbedded in a cake of ice in his shop window, and any one could walk in and feel the inside of them and see that they were warm. A hatter in Antwerp who manufactures a waterproof silk hat keeps one of them in his shop window suspended over a pan, with a stream of water running over it. I never passed this store once without seeing a crowd of people standing in front of it, and I don't doubt that this scheme brought him many a customer he would not have otherwise had.

"In Paris a firm of safemakers employed two men to stand in the window of their place all day and hammer on the lock of one of their safes with huge sledge hammers. The novel designs that confectioners and pastry cooks get up and put in their windows attract the attention and admiration of all foreigners. Every confectioner in Paris who goes in for window advertising at all has a big Eiffel Tower of candy in his window; but, fine as the Parisian displays are, they are not nearly so handsome as those in Brussels. The amount of cake and candy which is wasted in window decoration in the big Belgian cities is amazing. I can't see what use the sweets can be after the things are pulled apart, and certainly no one can have any use for a huge castle or figure made out of cake and candy, unless it is used as a centerpiece on a banquet table."

— THE WOMAN OF THE WORLD.—She entered the hardware store with the air of one who confers a favor on the earth by continuing to exist upon it. She was as portly as middle age and high living could make her and as slender as a tailor-made gown could force her to be. She looked through the clerk with her lorgnette and then said:

"Have you alabaster plates and cooking utensils?"

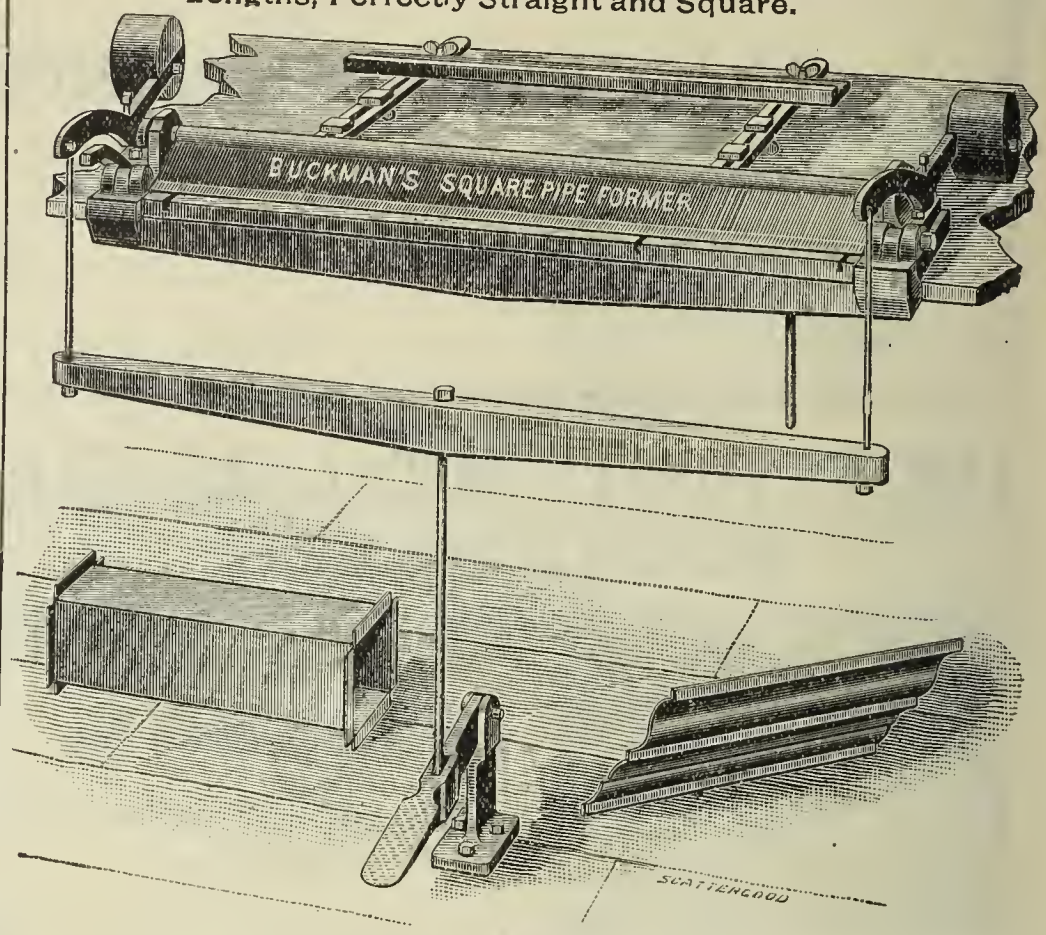
"Alabaster?" faltered the clerk. "I don't think we have, madame."

"Surely you have," she retorted wearily, as one who is very tired of having to teach people what they ought to know themselves. "All stores must keep them. They are quite common."

"We do not," replied the clerk deferentially, "or at least we do not call them by that name."

"Probably not," said madame contemptuously. "Then see if you recognize them under the name of fire proof."

"Oh!" cried the clerk, a great light breaking in upon his brain. "You meant asbestos, not alabaster."



And for the next 15 minutes the stout, imposing lady had a little less the air of conferring a favor upon the community by living.—*Exchange.*

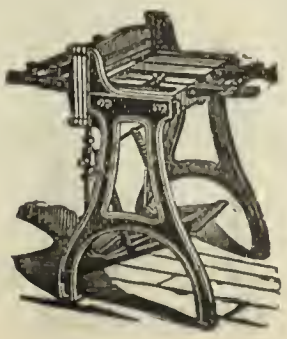
And other SHEET METAL TOOLS

OF ALL KINDS.

Please send for Illustrated Price-Lists describing 300 kinds Presses, every kind of Dies, Tinners Tools, Solder Apparatus, &c., for the manufacture of Cans, Tinware, Sheet Iron Goods, Lamps, Gas Fixtures and other Brass Goods, Silverware, Hardware and other Iron Goods of every kind.

Six sizes of New "Style C" Inclinable Presses, Heavy, Handsome, Durable and Very Popular.

TINNERS' MACHINERY AND SUPPLY CO.,



SUCCESSORS TO

HIBBERD & SPINNER,

9 CLIFF STREET, - NEW YORK CITY.

Tinners' Tools and Machines, Plumbers' Tools, Cornice Machinery. Presses, Dies and Can Makers' Tools.

FULL LINE OF SUPPLIES.

— "ARE you interested in golf, Mrs. Jennings?" asked young Simpkins, after racking his brains for some time for something to say.

"I'm not familiar with his works at all," replied the old lady. "What has he written?"—*Exchange.*

— BERTIE: "I wish your slippers had asbestos soles, mamma."

Mamma: "On account of the warmth?"

Bertie: "No, but because then they couldn't burn."—*Exchange.*

THE METAL WORKER

PATTERN BOOK.

SEVENTH EDITION.

This is a handsome volume of 242 pages, printed on heavy paper, and substantially bound in cloth. It is illustrated by upward of 520 line engravings.

The work is comprised in five general divisions or chapters, bearing the following titles: (1) Definitions and Technicalities; (2) Drawing Tools and Materials; (3) Geometrical Problems; (4) The Art and Science of Pattern Cutting, and (5) Pattern Problems. These titles sufficiently indicate the subject matter of the several parts.

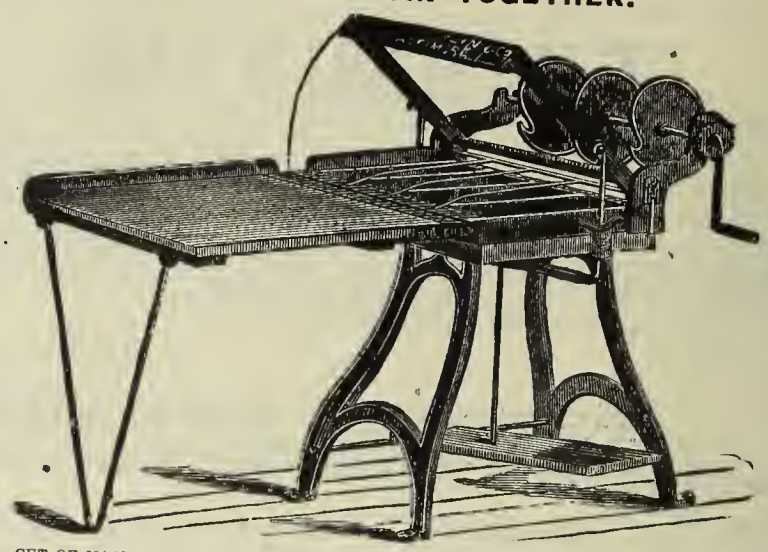
The List of Problems

demonstrated is very extensive, and embraces almost everything of common occurence in the sheet-metal trades, with enough of the exceptional to show methods adapted to special requirements. This chapter, in short, is a ready reference book for all who have pattern cutting to do. Each demonstration is complete in itself. A carefully prepared index facilitates reference. The work has been prepared for sheet-metal workers in general, and not for any one class in particular. The tinner will find in it what he requires, without the necessity of studying the cornice problems. The cornice maker will find in it everything from a simple miter to the most complex problems, so arranged as to meet his requirements, without the necessity of going through portions in which he is not interested. The general student will find the entire subject presented in such a manner as will facilitate systematic study. The rapidity with which each edition has been exhausted, and the universally favorable comments it has called forth, prove that it fully meets the want it was intended to supply

PRICE, POST OR EXPRESS PAID, $5.

ADDRESS ALL ORDERS TO

DAVID WILLIAMS,



Publisher and Bookseller,

96-102 Reade Street, New York.

Patent Roofing Seamer,

FOR PUTTING TIN TOGETHER.

A BOY CAN WORK IT.

OVER 4,000 IN USE.

CUT OF MACHINE, SHOWING THE DROP TABLE RAISED IN POSITION TO OPERATE.

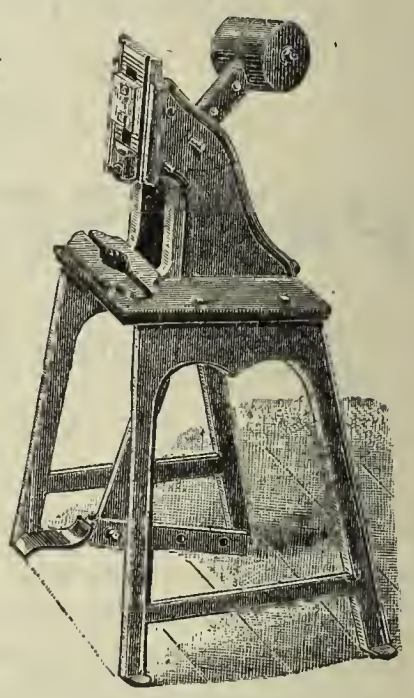
WE GUARANTEE THIS MACHINE SUPERIOR TO ALL OTHERS MADE FOR THE PURPOSE:

First, for Rapidity of Work.

Second, for Quality of Work.

Third, for Simplicity of Construction and Ease in Operating it.

To those undertaking large contracts at close prices, in fact, *to any Roofer who appreciates saving of time and labor,* this machine is indispensable. Send for testimonials, &c., to



LYON, CONKLIN & CO.,

Importers Tin Plates and Metals,

ESTABLISHED 1860. BALTIMORE.

—OUR—

PENDULUM PRESSES

are suitable for a wide range of work. Grooved beds with sliding bolts for holding all sizes of dies. Perfectly fitted balanced, and adjustable to light and heavy blows. A first-class machine in every respect.

MANUFACTURED BY

G. A. Crosby & Co.,

176 & 178 So. Clinton St., CHICAGO, ILL., U. S. A.,

DESIGNERS AND BUILDERS OF

Power, Screw, Drop, Hand and Foot Presses, Squaring and Trimming Shears and Special Machinery for Can, Soap Makers', and other lines of goods, including **Lanterns, Oil and Vapor Stoves, Locks, Hinges, Brass Goods and all Hardware Novelties.**

Special Attention to Dies of every Description.

WORK GUARANTEED THE BEST.

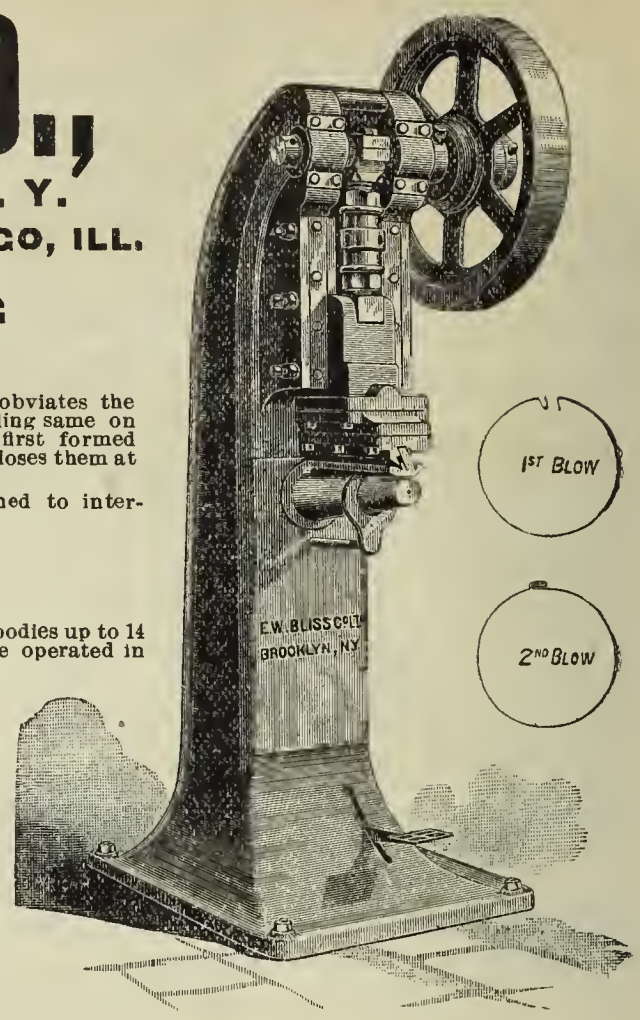
DUPLEX FOLDING AND SEAMING MACHINE.

THIS machine is designed to facilitate the manufacture of lock-seamed tinware. It obviates the necessity of using a bar-folder for forming the hooks on the body blank before rolling same on the forming machine. Its operation is exceedingly simple and reliable. The blank is first formed in the rolls, then placed in the machine, which forms the two hooks at one stroke and closes them at a second operation. The advantages obtained are:



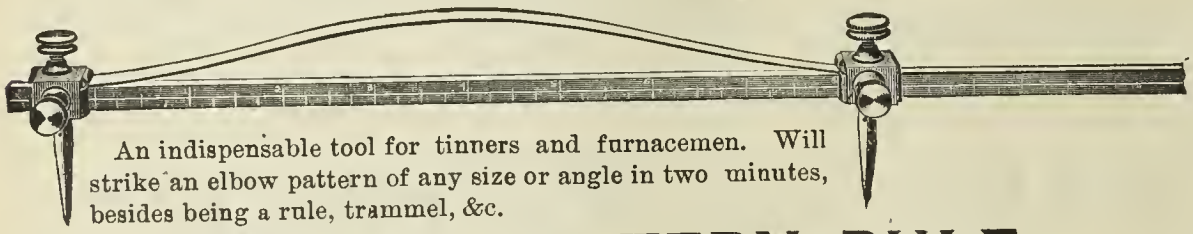
First—That the blank is rolled in the flat, not having any hooks previously formed to interfere with the operation.

Second—That both edges are hooked at one blow.

Third—That the hook forming and closing are done in one handling.

Fourth—That the seam is more uniform than if started in the bar-folder.

The horn can be arranged to throw the seam inside or outside. All sizes of bodies up to 14 inches long can be done on the one horn. These horns and forces are not adapted to be operated in presses having more than ½ inch throw.



PRESSES, PUNCHES, SHEARS,

DROP HAMMERS,

DIES, SPECIAL MACHINERY &c.

THE STILES & PARKER PRESS CO.

An indispensable tool for tinners and furnacemen. Will strike an elbow pattern of any size or angle in two minutes, besides being a rule, trammel, &c.

"MAGIC" PATTERN RULE.

Price Reduced to $3.50 Net Cash.

Complete with Chart. Will pay for itself in a short time.

Send for Descriptive Circular.

LUFKIN RULE CO.,

SAGINAW, MICH.

— "I'M saving up to buy you a Christmas present, grandpa," said Willie.

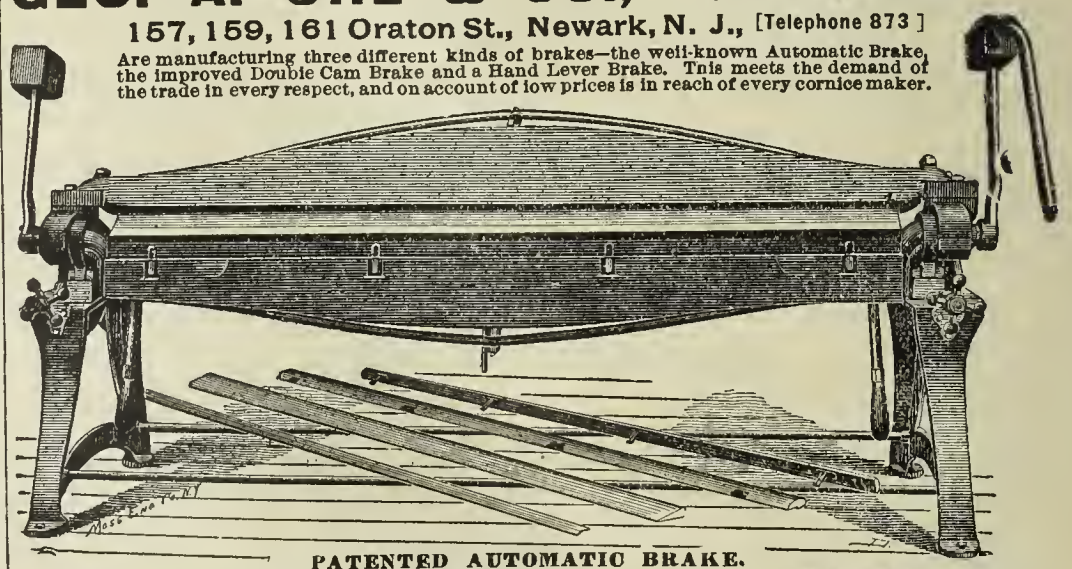
"That's very nice of you, my boy," said the old gentleman. "How much have you got?"

"Well," Willie replied, "if you'll give me ten cents, I'll have eleven altogether."—*Harper's Young People.*

— TRUE ENOUGH.—The Lady: "I should think a healthy looking man like you would be ashamed to beg."

The Tramp: "It's becoz I'm healthy that I hav ter beg, mum. If I had the dispepsey, for instance, I wouldn't trouble myself so much about vittles."—*The Press.*

— DIFFERENT —Hicks: "I'd be ashamed to raise such a row about having my face washed."



Dick Hicks: "That's all very well to talk for a man; when your face gets dirty you can go and get shaved."—*The World.*

GEO. A. OHL & CO.,

Successors to the Calvin Carr Cornice Machine Co.,

157, 159, 161 Oraton St., Newark, N. J., [Telephone 873]

Are manufacturing three different kinds of brakes—the well-known Automatic Brake, the improved Double Cam Brake and a Hand Lever Brake. This meets the demand of the trade in every respect, and on account of low prices is in reach of every cornice maker.

PATENTED AUTOMATIC BRAKE.

We also manufacture Circular Machines, Squaring Shears, Slip Rolls, Drop Presses, Shears and Punches, Scroll Shears, Brace and Wire Benders, and all machinery used by sheet-metal workers. Special attention called to our improved Hammering Machines, patented December 27th, 1892. Send for our illustrated catalogue.

Branch Office, 111 Water St., Pittsburgh. Pa.

HAMILTON'S
BEST REDIPPED AMERICAN ROOFING TIN

is DIPPED AND REDIPPED by HAND, and is NOT coated by machines through ROLLS like some plates that are lauded so highly by the makers, and the coating on Hamilton's Best Redipped is as heavy on the TOP half of the sheet as it is on the BOTTOM half. You have scales, test it. We can furnish machine coated plates with 20 lbs. of coating to the box of I. C. 20 x 28 at $11.50 per box, fully equal to any of the so-called extra coated plates.

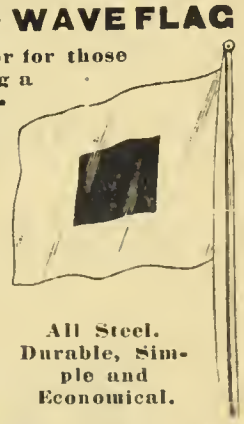
APOLLO BEST BLOOM

is the brand of galvanized iron that is true to gauge, flat (does not buckle), and is uniformly workable bends without weakening).

GALVANIZED IRON

A first-class worker in galvanized iron knows, to his cost, the difficulties, in exacting work, imposed by refractory metal and sheets not flat, and the losses incurred through varying thickness.

EVERY SHEET GUARANTEED



The extra cost is too small to appear in small sales. The actual cost of his job to the worker is less, if well done

REGULATORS

For all purposes where any kind of Automatic Regulation of Air, water or steam is required.

MASON REGULATOR CO.,
Boston, Mass.

The Jenkins Automatic Air Valve has proved to be all we claimed for it—i. e., a Positive and Reliable Air Valve. The expansible plug is a special compound, and manufactured expressly for use in the Jenkins Automatic Air Valve. It does not deteriorate or lose its flexibility under the action of heat or steam. With the Jenkins Automatic Air Valve, you should connect with a drip pipe, thus insuring a positive circulation. We guarantee them to be as represented. Our Trade-Mark is on every valve.

KERNAN Smoke Consumers Lead

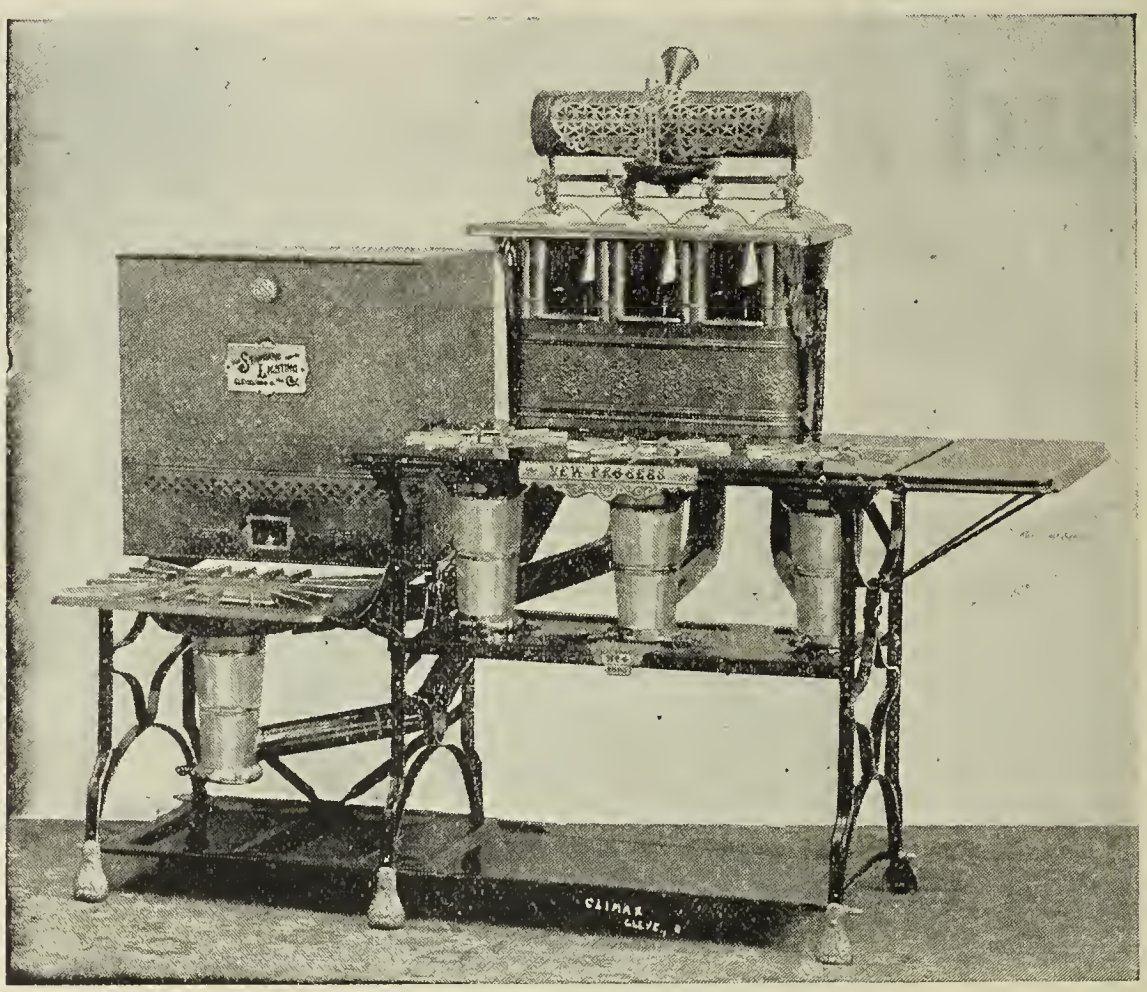
In all the sections of the country where soft coal is used.

SECTIONAL VIEW,

showing the principle in the Kernan Smoke Consumer Furnace of a heated current of air entering the fire-pot, igniting with and consuming the smoke from soft coal.

Now is the time to secure the agency and thereby control the furnace trade of your locality. Do not waste time and money experimenting on new and untried constructions. The

Kernan Smoke Consumers



have been used for several years in all parts of the country and with every variety of soft coal, and are now conceded by the trade and public to be the only warm air furnace in which soft coal can be cleanly and economically used.

Send for Reference Catalogue of Soft Coal Furnaces.

IMPORTANT ANNOUNCEMENT.

To Our Patrons and the Trade Generally:

Our new Catalogue for 1895 will be ready for distribution within a few weeks. We take this means of announcing in advance of its publication that we have very carefully studied the requirements of the trade in every particular, and that our lines will be complete. We will place on the market specialties in entirely new goods that will commend themselves both by reason of popular prices and their many attractive and desirable features. In addition to our very popular Oilgas Cook Stoves, containing our improved 1895 Burners that are giving such perfect satisfaction, we have something entirely new in the line of special Lamp Stoves at special prices; also Sheet Steel Circular Burner Oil Cook Stoves. Write for further information and prices.

Facts of Interest to the Public.

Our "PROCESS" for 1895, we can say unqualifiedly, is the

MOST PERFECT WORKING

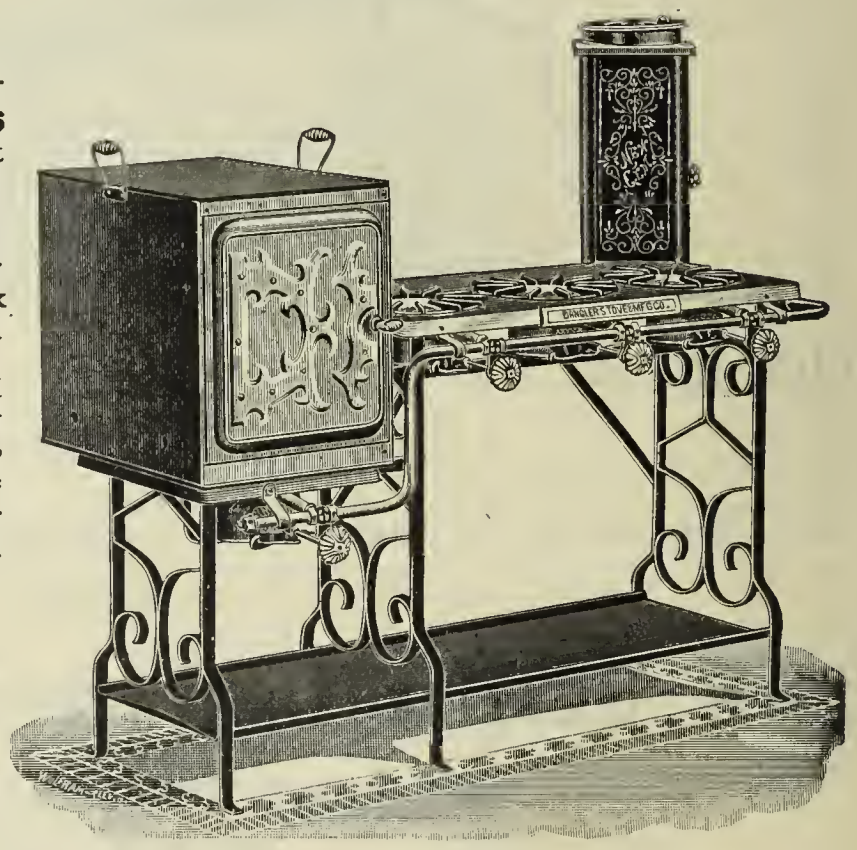
PROCESS STOVE EVER PLACED ON THE MARKET, and HAS NO EQUAL.

In calling attention to our

NEW GEM STOVE,

We offer the trade a STOVE FOR THE PEOPLE and FOR THE TIMES.

THE GEM STOVE is CONVENIENT



in SIZE, with the same sized flame as the PROCESS doing the same amount of work with **less fuel,** and at an original cost of only about ONE-HALF that of the regular high Stoves. This Stove is ABSOLUTELY our own, and CAN BE MADE ONLY BY US, and as pioneers in this business, the public naturally look to us for progress, while some of our competitors, who can only make the old line, call such improvements, "an innovation." Our GEM and PROCESS, together with our DELIGHT, celebrated JUNIORS, Individual and Single Generator Burner Stoves, &c., will give our trade a decided advantage over their competitors,

MASON & DAVIS CO.,

72 LAKE STREET, CHICAGO.

The Michigan Stove Company
Largest Makers of Stoves and
Ranges in the World.
Detroit, Chicago, Buffalo,
New York City.

. . . It has been said that in America TWO CLASSES of Stoves and Ranges are sold, viz.: . . .

"GARLANDS" AND OTHERS.

At the very HEAD and FRONT of the "Others" stands our new line of . . . **"MICHIGAN" Stoves and Ranges,**

Which are unquestionably the latest, handsomest and most artistically-designed Stoves and Ranges to be found upon the market at anything like the price at which they are sold.

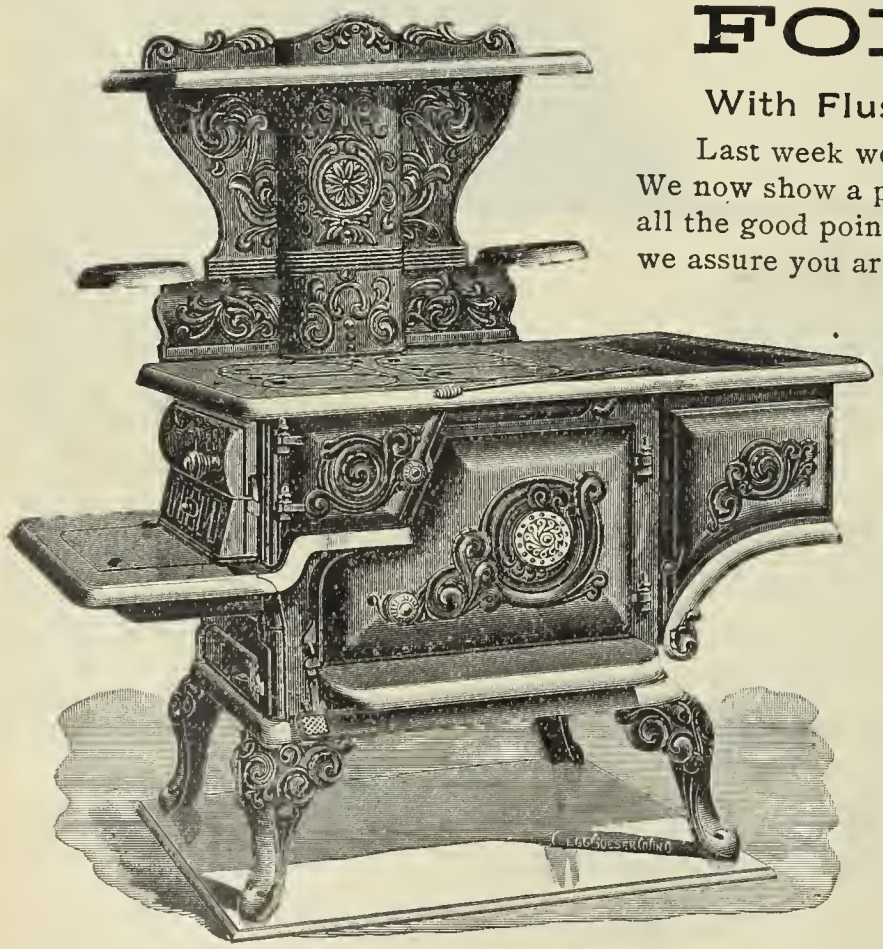
They are made under our own supervision; by same workmen and out of the same material from which "Garlands" are made, and this fact of itself should be sufficient to cause them to be preferred by discriminating merchants and consumers, as against all other brands, excepting the invincible line of "Garlands."

Taplin, Rice & Company,

—Manufacturers.—

DICTATED BY P.

Akron, Ohio, January 29, 1895.



BY THIS we beg to call the attention of the trade to the fact that during the current year we will be on the market with several new patterns of Steel Ranges and Heating Stoves, of superior construction, ornamentation and attractive form, the patterns of which are well under way and will soon be ready for the sand. The Climax Steel Range, which will be made in all the various conventional forms and styles, will be both as to construction and appearance second to none on the market. We will also have ready for the trade in due time a "Climax Air Blast" and "Climax Air Tight" heating stove in different sizes, the constructive features of which will be a radical departure from any pattern of stove ever offered, and we feel well assured they will wherever introduced take a leading position in the line of special heaters. Cuts and prices of these Ranges and Stoves will be mailed on application at an early date, and we are confident you will feel justified in deferring your order for supplies until samples or cuts of stoves named may reach you.

With grateful appreciation of former courteous favors shown us by the trade, we remain,

Very respectfully,

TAPLIN, RICE & CO.

Our Queen

FOR WOOD,

With Flush Reservoir and High Shelf.

Last week we illustrated the Northern Queen, for coal. We now show a plainer finished production for wood. It has all the good points possessed by our other productions, which we assure you are many, and we do and can recommend it to all dealers as a first-class seller. If you will send for a catalogue you can learn more about stove construction and the merits of our especial productions in less time than it takes to tell it here. The cat. is free.

IT IS A LOW FURNACE.

CORNING, N. Y., January 15th, 1895.
CORNING MFG. CO., Corning, N. Y.
Gentlemen: The Victor Furnace which you placed in my residence last fall I desire to advise you is working very satisfactorily. Of the thirteen registers we have not needed to open but five to warm the entire house at an even temperature of 70 degrees. The coldest night of the present winter I arrived home on a late train and found the house at 68 degrees, the point at which the thermostat was set, although the thermometer registered 28 degrees below zero that night. You certainly are manufacturing a very desirable Furnace.
Very truly yours,
CHAS. L. DENISON.

SECOND EDITION.

KITCHEN BOILER CONNECTIONS.

A SELECTION OF

Practical Letters and Articles Relating to Water Backs and Range Boilers.

Compiled from THE METAL WORKER.

71 Illustrations, 8vo, 140 Pages, Cloth, Price, $1.00

The book is well got up and the information well given. Those interested in works of this character will do well in buying it.—*The Plumber and Decorator.*

The Metal Worker produces in this volume a number of queries, with answers thereto, which have appeared in that paper. It will be seen that *any plumber who is troubled to make boilers work satisfactorily will here find his troubles alleviated. It contains numerous illustrations and throughout is highly practical from the standpoint of the plumber.* It contains a table of contents and an index.—*Scientific American.*

The publisher of this work is well known for his former successful efforts in the publication of useful and thoroughly practical books for metal workers and steam fitters The book before us is a model of its kind in judicious compilation, practical instruction, neat illustrations and general typographical appearance.—*The Master Steam Fitter.*

Can be considered an authority on the subject to which it relates.—*American Engineering.*

The book is a practical helper to every member of the plumbing trade, who, being alive to his own interests, should embrace this opportunity to obtain the valuable instruction in which the work abounds.—*New England Stove, Hardware and House Furnisher.*

A well bound, well printed, well illustrated and well edited book. . . The special field of this work is very thoroughly covered. . . Abounding in rare technical information of a practical character. *American Artisan.*

Nearly every problem is illustrated fully and this interesting question of water back connections will be found to be quite fully treated in the volume.—*Domestic Engineering.*

Both interesting and instructive to our trade. It shows how mistakes are apt to arise and how they may be overcome —*Plumbers' Trade Journal.*

Sent, post-paid, on receipt of price by

DAVID WILLIAMS, Publisher,

96-102 Reade Street, NEW YORK.

THE METAL WORKER ESSAYS

—ON—

HOUSE HEATING

—BY—

STEAM, HOT WATER AND HOT AIR

With Introduction and Tabular Comparisons.

Second edition, revised. To which has been added a selection from the Letters of Criticism on the Essays as originally published in THE METAL WORKER and a chapter on Proportioning Radiating Surfaces.

"The various subjects treated on are indicated by marginal sub-headings for reference purposes, and the illustrations, computations, &c., are plain and easy of understanding. The book may truthfully be said to be a careful compilation of the best ideas of these best qualified to speak on the subjects treated of, and to form as a whole the very latest and most valuable literature on a topic which is becoming more and more recognized as being of the first importance in the building and furnishing of healthful homes."—*The Building Trades Journal.*

"It constitutes one of the most valuable works on the subject of house heating hitherto published. It is a terse compendium of practical knowledge of all that is most useful on the subject, wholly ignoring an enormous amount of useless speculation upon the subject comprised in numerous volumes and the current literature of the day—written by persons who adopt theories and vainly search for facts to sustain them—not worth the reading. *Per contra*, the work before us is alike commendable to major-domos who would be well informed on the subject, and to engineers of heating and ventilation, who cannot afford to do without it."—*The Sanatarian.*

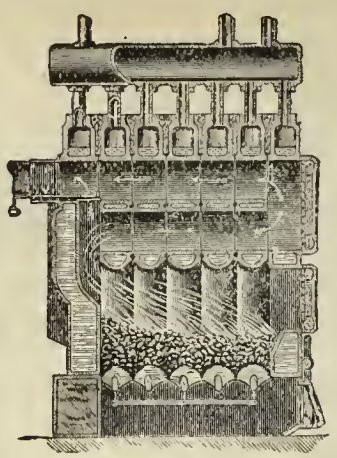
"There are fifteen essays in all, and every one of them is well worth the careful consideration of those interested in this most important subject. . . . The work is undoubtedly one of the most practical and highly valuable ever given to the public on the subject of house heating, and so thoroughly contrasts the different systems considered as to leave the subject almost, if not completely, exhausted. We commend it to the kindly consideration of all of our readers who desire the most practical views on the subject of which it treats."—*The Age of Steel.*

"Practical men have contributed of their knowledge in such a way and in such a form as to make the subject interesting as well as highly instructive, and with copious tables and diagrams showing the various methods of piping, etc., the work is unlike any book published. The book treats the subject in a common-sense method and goes directly to the point without any theorizing. It is a valued work and worth the money it costs many times over. It should be read by all devotees of the systems advocated in its pages, as it deals with a subject that is becoming more and more important every year and one that demands the best thought and the highest skill of every workman."—*Register and Bulletin.*

"It is a practical book. It does not contain rules that depend for their integrity upon one set of conditions, and which may not suit any other condition. The book is for the student and when studied it will be found surprising how much information it contains that may not appear by a superficial glance or hasty examination."—*Boston Journal of Commerce.*

The work is handsomely presented in a volume of 288 pages in the form of a handy reference book, with many illustrations, showing the several ideas and methods of heating, ventilation and economical arrangement of pipes and radiators, &c. The very complete specifications of materials which accompany several of the essays give a value to the work that will be understood and appreciated by the architect and builder who aim for excellence in this branch of house building."—*The National Builder.*

JAMES SQUIRE, *Youngstown, Ohio.*—"If we had only had the information contained in this volume in earlier life, we could now have dollars where we only have buttons."



407 pages, 7 x 9½ inches. Handsomely bound in cloth. One volume.

PRICE, $3.00.

Sent post-paid on receipt of price by

DAVID WILLIAMS, Publisher,

96-102 Reade St., New York.

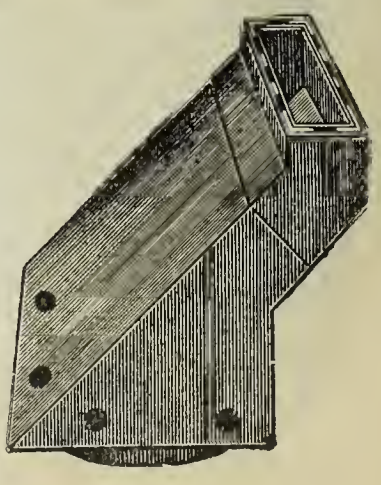
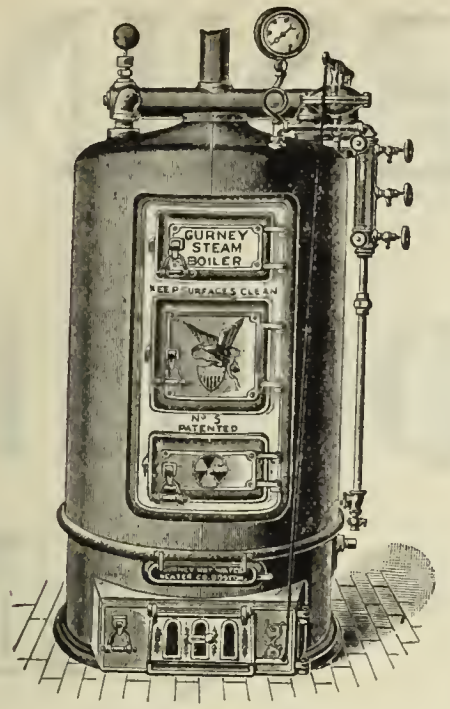
Novelty Ventilated Wall Pipe,



Absolutely Fire Proof.



The "Novelty Ventilated Wall Pipe" is manufactured of best bright tin, by machinery made specially for the purpose, and is made in lengths from 1 inch to 8 feet, the joints all being double seamed; and is constructed in such a manner that any mechanic can, if it becomes necessary to shorten pipe, remove socket end, cut pipe off and replace socket in a few moments.

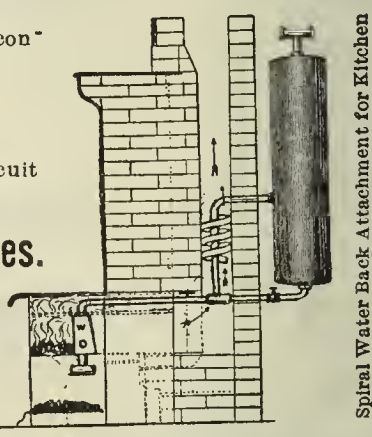
THE GLENMORE

Spiral Hot Water Generator.

(PATENTED.)

For General Heating Purposes, but Especially Adapted to House Heating.



COMMENDATORY POINTS:

Simple construction. Practically composed of two sections, consequently few joints and nothing to give out.
Large heating surfaces.
Products of combustion fully utilized.
Instantaneous generation of hot water.
Free and easy circulation.
Easily cleaned fire surfaces.
Hot water may be drawn off at any point along the pipe circuit without materially affecting the heating service.
Grate conducive to economy in fuel.

Spiral Water Back Attachment for Kitchen Ranges.

By utilizing waste heat, this water back extends the capacity of a kitchen boiler, and makes it a valuable heating auxiliary, especially in spring and fall, when the regular heating apparatus is too powerful.

"JUST AS GOOD AS THE AKRON 'AIR BLAST' FURNACE,"

AKRON AIR BLAST FURNACE.

Has become a familiar expression with the stove trade in many States.

Don't you want to make your competitors use it? Why it is so commonly used, is a Think to thought about.

WE ARE IN IT.

The past extremely cold weather has clearly demonstrated that.

THE ORIGINAL AKRON AIR BLAST FURNACE and its many agents are strictly in the swim. There is no weather too cold for us.

After twenty-five years' experience with the best furnaces made our Mr. May was convinced by careful experimenting and studying that they were not built on scientific principles, and therefore he invented and six years ago perfected the "Air Blast" principle for burning coal, which he has applied to the Akron Air Blast Furnace, and it has been so successful in burning all kinds of fuel, especially soft coal, that it has completely revolutionized the furnace business, and all manufacturers of the best furnaces are now trying to imitate it. The Akron Air Blast Furnace is the original and leader. Others follow.

THOUSANDS of users are glad to testify to its merits and its economy.

HUNDREDS of dealers are happy with its success.

DOZENS of imitators are wondering how it took its place at the front in so short a space of time.

ONE special dealer we are desirous of informing as to why the Akron Air Blast Furnace has such a wonderful record. You we mean. Write us.

Build up your trade with a certainty. No need of making furnace work a hit and miss.

Can you equal the following record with the furnace you are selling?

We have hundreds of agents in Ohio, Indiana, Illinois, Iowa and other States whose experience is equal to this. Carload and duplicate orders from them prove that their trade is increasing.

76 Furnaces Sold

AND NOT ONE COMPLAINT.

THE

Akron "Air Blast" Furnace

Has proven a Record Breaker. Even in hard times our agents have been busy. You should secure agency at once and be in the race at the front.

READ THE FOLLOWING LETTER:

OFFICE OF
WELCH & HORTON,

NEW CASTLE, Pa., March 28, 1894.

Messrs. May & Fiebeger, Akron, Ohio.

GENTLEMEN: We took the agency of the Akron Air Blast Furnace late in the season of 1891, and have sold up to the present time 76 Furnaces, and have not had a complaint from a single furnace, which we consider is the best recommendation the furnace can have. Our furnace trade has been affected less by the hard times than any other line of goods we handle, which shows that people always find the means with which to buy a good article.

The Akron Air Blast Furnace has established a reputation for itself through Lawrence County that other furnaces cannot overcome, and when they make a sale it is to parties who look at price and not the furnace. We know that we have the best furnace on the market to-day and our customers know it, too. Wishing you success for 1894, we remain, Yours respectfully.

WELCH & HORTON.

How Ancient Pottery Was Made.

What served people in any line of work before patents? The answer, says O. T. Mason, in the *Inventive Age*, is easy, and not to be questioned. It was manual dexterity and bodily knack. I have been looking up the potter's wheel lately and find that prehistoric pottery as well as that of the uncivilized was made without a wheel. But they all get around the work in making it, and produce results of marvelous symmetry. The New Caledonians are Oceanic negroes, and produce superior ware. The potter uses a common water worn pebble as his wheel. Upon the flatter side he sticks a dab of clay, and around this he winds a coil of clay, widening as he goes, and smooths the work with his fingers and a flat stone. The under side of the pebble presents at its apex a small surface to the hard ground, and turns or pivots with ease. This is a natural potter's wheel on which the workman turns his vessel as he builds it up.

The Nicobar islander gets at the thing in another way. The operator, seated on the ground, places before her a board on which is laid a ring or hoop of cocoanut leaves closely woven. Upon this a shallow dish is set lined with a circular piece of plantain leaf that will stick to clay and slip in the dish. A lump of clay pressed on this leaf is the bottom of the vessel, which is afterward built up by the coiling method. The board, the smooth ring, the leaf in the dish constitute the potter's wheel.

Our own Southwestern Indian women work on the bottom of an old pot or basket, or inside of the same. They begin the coil sometimes at first, at other times a starting lump is used, but the old pot or basket is easily turned. The woman at times even walks around her work, a genuine case of getting there though one has to adopt the method of Mohammed.

— GOT AN UNDER BERTH.—One of the heaviest members of the House is also one of the shrewdest statesmen in Washington, and he seldom has to take an upper berth in a sleeping car. When once he discovered that he had drawn an upper berth in a Pullman he wanted to know whether the car was new and in good repair.

"The reason I want to know," he said, in a loud voice, "is because I had a rough experience last night and night before on one of your cars. They put me in an upper berth and both times it gave way in the middle of the night and let me down on the man underneath. I've got an upper berth this trip, and I don't care to have the thing happen again. You see, I'm a little heavier than the ordinary run, and it's no joke."

The other passengers began to prick up their ears and look around. A half dozen of them asked the fat gentleman what the number of his berth might be, and on his announcing it the timid occupant of the berth underneath proposed, with a great show of courtesy, that it would be a good thing to swap, and the exchange was made with glee on both sides.—*Exchange.*

— CONVINCED.—"You aver," said the black browed bandit, "that you are the celebrated cantatrice Mme. Squalkina. Prove it and you are free. Never shall it be said that a Cuttaweezanda would offer indignity to an opera soprano. It is against all tenets of the profession."

"How shall I prove my identity?" asked the captive.

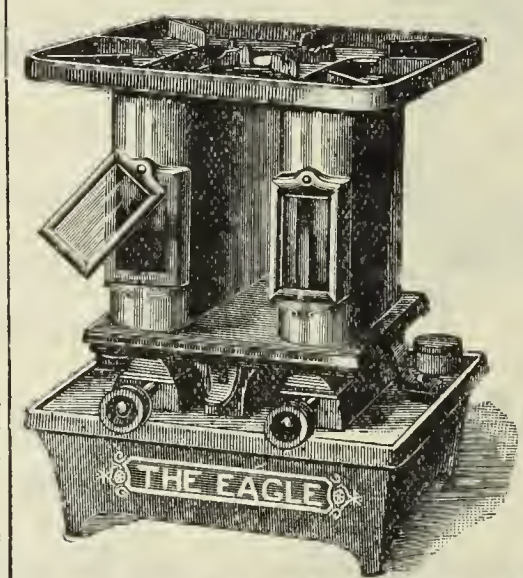
"By singing, of course."

"What? Sing in this cave? No bouquets? No steam heat? And not a cent in the box office? Never!"

"Gentlemen," said the bandit, "it is evident that the lady is what she claims to be. Escort her to the nearest village and set her free."—*Indianapolis Journal.*

The Merrill Heater.

The Simplest, Most Attractive and Best Lamp Heater yet Offered to the Trade.



The top half is made of Aluminum, a metal that will not tarnish or discolor from heat, is light, durable and without a rival as a radiator; the under half is corrugated, heavily nickeled brass, which serves as a reflector, increasing, instead of impairing the light. No smoke—no odor—no broken chimneys

On a central draft lamp, it heats small rooms, takes the chill off larger ones, boils a pint of water in five minutes; in fact, it is a Model Emergency Stove. Thousands of New Englanders will testify to all we claim for it.

It is a seller. Liberal terms to dealers. Order through your jobber or the

Challenge Iceberg Refrigerators,

MANUFACTURED BY

The Challenge Corn Planter Co.,

GRAND HAVEN, MICH., U. S. A.

Write for our large Illustrated Catalogue for 1895.

All our goods are made of thoroughly kiln dried ash, finished in antique with Shellac and coach varnish. Panels are beautifully hand carved. Trimmings are of solid bronze and are our own pattern. We use our own patent air tight locks, patent self-retaining malleable casters and floor plates, and patent drip cups All Refrigerators are filled with pure charcoal. The Challenge Iceberg Refrigerators are the best made for preserving all articles stored therein pure and sweet, as there is always a circulation of pure, dry, cold air. Refrigerators having water coolers are provided with bronze faucet and cup holder. All Sideboards have a fine beveled French plate mirror. We manufacture Refrigerators of all sizes from the ordinary Ice Chest to the largest sizes for grocers' and butchers' use, including the most elegant line of Dining Room Sideboard Refrigerators ever put on the market.

THE CHALLENGE ICEBERG,

THE ∴ HONEST ∴ RELIABLE ∴ REFRIGERATORS,

SELL THE BEST.

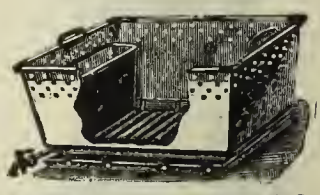
No. 21.

The Gurney Patent Refrigerator

is the BEST SELLER, gives the BEST SATISFACTION and PROFIT to the dealer of any refrigerator on the market. BECAUSE—It has special FEATURES, "TALKING POINTS," SELLING POINTS, not found in other refrigerators.

1. By the use of a ***Removable Galvanized Ice Compartment*** the ***"Gurney"*** can be cleaned. This feature alone assures its sale.

2. Under the ***"Gurney"*** principles of construction the ***lowest*** average temperature is reached with the ***greatest economy of ice,*** as fully explained in our catalogue.



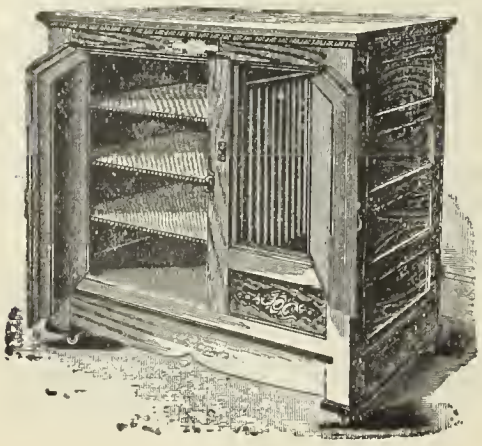
3. In the ***"Gurney"*** the ice does not come in contact with the zinc side walls, thus preventing condensation or "sweating" on the inside linings, an important feature of cleanliness and durability.

4. It is packed with Mineral Wool (the best non-conductor known).

5. It has the freest circulation and dryest air, there being a large space around the four side walls of the ice compartment, thus giving about six times the condensing surface of any refrigerator.

6. In style and finish it leads all competitors.

Send for Illustrated Catalogue and secure Agency.



Removable Galvanized Ice Compartment.

GURNEY REFRIGERATOR CO., Fond du Lac, Wis.

The Automatic Refrigerator

has more good points and does better work than any other and for that reason is a better seller. Our illustrated catalogue for 1895 te ls all about the line. Its advantages are:

Perfect circulation.
Large condensing and purifying capacity.
It has no flues to cause it to smell bad.
The trap is inside where it cannot he misplaced or lost.
The drip pipe may he cleaned without disturbing anything in either chamber, and is entirely out of the way
it has nine walls to protect the ice aud to maintain a uniform temperature in the cooling chamber.
It has woven wire provision sheives that are superior.
It has superior hardware.
It is more capacious and convenient.
Flavors of foods will not mix.
Last hut not least, it's different, and will hring new customers and new trade.

We want the leading dealers to sell our goods and but one dealer in a place.
The goods are made of ash, and well finished.
We have two factories, one in the East and one in the West, and are able to take better care of your trade than if we had but one.

Observation.

The habit of observation is one that may well be cultivated by every mechanic. To the practical man knowing but little of books and dependent almost entirely upon experience, there is, in fact, no other way by which he can obtain the information which is of use to him in his work. And yet there is a marked difference in individuals: some have their eyes so wide open and the faculties so ready to receive new impressions that nothing seems to escape them, while others plod along in the same old rut, looking neither to the right nor the left, and as a consequence absorb practically nothing from the progressive age in which they live. There is certainly no reasonable excuse for a lack of the faculty of observation. It is something that improves by using and more completely than anything else takes a man out of himself and makes of him a part of the world in which he moves. The story is familiar of the man of noted ability and extended knowledge who formed in youth the habit of observation by looking into store windows as he passed at his ordinary gait and then enumerating the various articles he had thus noted in his brief glance. To those who are older and have taken up some trade or profession, there is necessary only the spirit of perseverance. Make up your mind that each day you will, by observation, learn at least one new thing. Determine that, particularly in matters of importance, you will understand whatever comes in your way—the why and the wherefore. So far as it is proper to be inquisitive, ask questions, seek information far and wide, but do it intelligently or all will go for naught.

Travel.

It is hardly to be expected that the ordinary mechanic will have even the most modest opportunity for travel in the broad sense in which foreign tours are generally denominated. Nevertheless in his smaller sphere he has some chance to go about, to see new faces and new things, and, if he will, he may profit by them, proportionately, as the foreign tourist by his extended travels. Certainly nothing broadens a man in a general way as does travel. The lessons of the Fair are still fresh in our minds, and to many individuals a week in that wonderland of the age has marked an expansion in judgment and a comprehension of the world and its opportunities such as never came to them before. Many a mechanic who, by the character of the trade he follows, is compelled to go from place to place may well keep his eyes open. If he goes among other workmen in his own line, he will find much to be learned that is new to him, even if he be a full fledged journeyman, and if he is the progressive man that he should be, he will profit by all that is good and throw aside all that is useless. If it is his duty or privilege to go through other shops or manufactories he will see new methods, new tools, ingenious hints and convenient appliances, a knowledge of which, obtained by careful observation, may some time prove of inestimable value. Then, too, he will meet men whose characteristics he does not know, and his wits will be sharpened to estimate them at once and deal with them understandingly. He will see human nature in all its moods, and will be successful—particularly as a salesman—in so far as he is capable of adapting himself to those moods and thereby obtaining the sympathetic attention of the person with whom he deals.

Commissioner of Patents John S. Seymour, in his report of the work of his bureau for the calendar year 1894, just submitted to Congress, shows that during the year there were 20,803 patents granted and 1600 trade-marks registered. The patents expired in the same period numbered 12,920. The total expenditures were $1,100,047. The receipts over expenditures were $87,392, and the total balance to the credit of the Patent Office in the Treasury of the United States amounts to $4,369,135. In proportion to population more patents were issued to citizens of Connecticut than to those of any other State. Next in order in proportion to population are Massachusetts, the District of Columbia, New Jersey, Montana, Rhode Island, New York and Colorado. As to foreign countries, more patents were issued to subjects of Great Britain than of any other country, Germany and Canada coming next in order. The Commissioner recommends that the working force of the Patent Office be increased in order to adequately meet and keep pace with the growing work of this department.

Co-operative Trading in Great Britain

The "Annual" of the Co-operative Wholesale Societies, Limited, of England and Scotland for 1895 gives some interesting facts and figures in regard to the progress of the commercial co-operative movement in Great Britain during the first 30 years of its existence. In that period, from 1864 to 1893, inclusive, the aggregate sales of the societies amounted in round numbers to $525,000,000 dollars, on which the profits amounted to $6,500,000, notwithstanding the fact that the profit charged on the purchases of the members was merely nominal. The average yearly increase in sales has amounted to nearly $2,250,000, the aggregate for 1893 approaching $50,000,000. In the last ten years the volume of sales has more than doubled. The number of branch societies holding shares in the Co-operative Wholesale Society is 1010, with a total membership of 873,698. Its share capital is $2,736,720; loans and deposits, $4 403,915; reserve fund, $171,900, and insurance fund, $1,156,-243. The Co-operative Wholesale Society has branches in all the principal cities and towns of Great Britain and Ireland, as well as in the chief European seaports, running a line of six steam vessels for the conveyance of freight to its branches abroad. It has its own banks and owns a considerable number of factories in the United Kingdom, where it manufactures most of its own products.

The magnitude of the commercial co-operative system, as now existing in Great Britain, is only paralleled by the remarkable success which has attended the movement. It must be borne in mind that the particular aggregation of societies above alluded to does not by any means embrace all the co-operative trading associations in the country. There are many, some being of the first importance, which are not affiliated with it. The total sales for the past 31 years of all such societies in Great Britain and Ireland have been over $3,283,700 000 in value, at a profit of about $285 500,000, upon a share capital of $70,308,980 and a loan capital of $16,113,350. They have a total membership of over 1,300,000.

The Mayor and Council of Cadiz, Ohio, are advertising for bids for the furnishing and erecting complete of the air lift machinery necessary to pump from drilled wells the water to supply the pumping station in the said town. The materials will consist of two compressors, a receiver, four or more foot pieces and lubricators, gauger, &c. They also want bids for furnishing the material and performing the labor necessary for the construction of the system of water works, requiring 450 tons of cast iron pipe, 10 tons of special castings, 50 hydrants, 39 valves and boxes, 2 pumping engines, 2 boilers, brick pumping station and stack, pump well and 22 776 lineal feet of pipe laid. The plans will be ready by March 1, 1895, and the proposals will be received until noon Tuesday, March 19. James Moore is the Mayor and L. E. Chapin of Canton and W. G. Clark of Toledo are the consulting engineers.

THE LETTER BOX.

Are Gravel Roofs Durable?

From G. F. WHEELOCK, *Birmingham, Ala.*—I notice in *The Metal Worker* of February 16 that your correspondent "G. D. B." of Greenville, S. C., makes the assertion that he can put on a good tin roof at $4 per square, and make more money on it than he could with a gravel roof at $5 per square. Being engaged in both tin and gravel roofing, and being of a very inquiring turn of mind, I would like to have him inform me where he buys his plate, it being presumed that to furnish a good 20-year roof he would only use a good redipped tin, and the best I have been able to do is $15 per box in the market for this grade, and this, without any freight added, is equivalent to $4.30 per square for tin alone for a standing seam roof. I cannot help thinking that you have misquoted "G. D. B." as to the $4 roof; either this, or he is basing his calculations on a very cheap plate; and unless he has the advantage of buying a superior plate at a price that others would pay for wasters, he certainly must have a very poor opinion of a gravel roof. A gravel roof, in my opinion, especially where asphalt is substituted for coal tar composition, is the best material for a roof where the pitch does not exceed ¾ inch to the foot. It has the advantage of a tin roof, when properly applied, of being a first-class roof under any climatic conditions, which is not the case with the metal. In this city tin roofing, where laid flat locked and soldered, has proven very unsatisfactory, due, I suppose, to the presence of our iron furnaces to a great extent. There is one argument which is a good sized club in the hands of the gravel roofer: the roof does not require painting every two years, which is a fixed charge on a tin roof that in a few years amounts to the first cost of the roof.

As the result of my experience, I want to make the "assertion," which will not probably meet with the approval of "G. D. B.," that a first-class gravel roof can be laid for less money than a first-class tin roof, with a greater profit for the roofer, if gravel or shell can be procured within 200 miles of the work.

Insurance Rates on Gasoline Stoves.

From J. G. F. W., *Indiana.*—I was interested in the letter that appeared in *The Metal Worker* recently, respecting the rates of insurance where gasoline furnace is used. We have inserted in our policy permission to use gasoline for soldering pots, and to have 1 gallon of benzine for blacking purposes, to use gasoline stoves for exhibition purposes and to sell gasoline, stipulating where the gasoline shed is located, and that it be drawn by day only. We paid no extra rates.

Frozen Wind Mill Tanks.

From W. A. F., *Matawan, N. J.*—I have several customers who have water tanks supplied by wind mills. The tanks stand on towers 30 feet from the ground, the feed and supply pipes being wrapped with two layers of ¾ inch hair felt and incased in a box packed with salt hay. During the last cold snap the water froze on the bottom of the tanks 2 or 3 inches thick. This, of course, stopped the flow of water and allowed the feed pipe to freeze in the box. Will any of the readers of *The Metal Worker* inform me if they have had a like experience and if so can they suggest a remedy? Any information they can furnish through the Letter Box will be much appreciated.

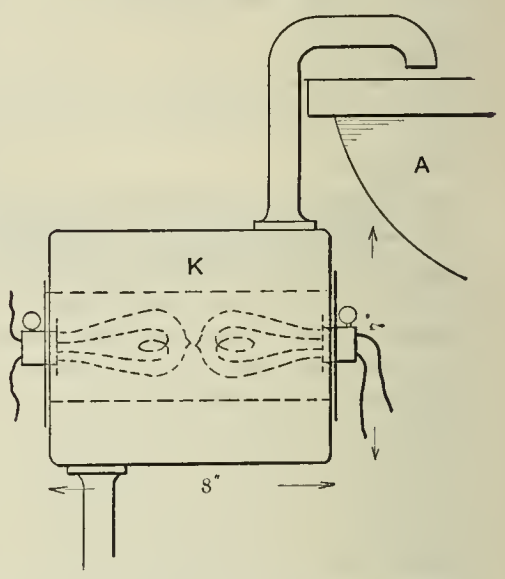
Heating of Tin Roofs.

From J. G. F. W., *Indiana.*—I notice the inquiry from "G. D. B." in *The Metal Worker* of February 16, who complains about heat of tin roofs. I would suggest, however, that all difficulty can be removed if he will put paper underneath the tin.

Scant Radiation.

From HOT WATER, *Pennsylvania.*—I have had placed in my residence a hot water heater, with results that are very unsatisfactory. The heating contractor contracted to heat the house to 70° in zero weather, which it is impossible to do, although the temperature of the water in the heater is 200° and all the radiators hot. Will you please advise me if the defects are in the boiler, radiation, or system of piping?

Answer.—The chief causes of dissatisfaction in hot water heating are: 1. Insufficient boiler. 2. Improper system of piping. 3. Insufficient radiation. If the boiler is capable of maintaining a temperature of 200° when supplying all the radiators, it is evident that it is sufficient. If the system of piping delivers the water to the radiators so that it is possible to maintain the same temperature in all with all valves open, it is evident that the piping system is properly constructed. If the boiler maintains and the system of piping delivers the water at high temperatures to the radiation, and the rooms are not heated to the temperatures desired, the cause is insufficient radiation. It is evident from your description of the apparatus that "insufficient radiation" is keeping you in "hot water."



Paste for Asbestos Paper.

From J. CALLAGHAN & SONS, *Cleveland, Ohio.*—We would be very thankful to you or your readers if you would favor us with a recipe for a paste to stick asbestos paper on hot air pipes. Something that will keep and not get sour and smell.

Note.—Some furnacemen simply soak or wet the edges of the paper thoroughly and make a good lap, and when the paper becomes dry there is no need for a paste. Our readers are invited to describe their methods.

Heating Water by Incandescent Lamps.

From C. F. N., *Brooklyn.*—In answer to "J. R.," Hoboken, N. J., who wishes to know a way to heat water for lavatory purposes by means of incandescent lamps for a customer in an office,

Heating Water by Incandescent Lamps.—Fig. 1.—Basin with Water Cylinder.

the following rough sketch will give him some idea of fixing up a cylinder or a coil of piping for the purpose. In Fig. 1, A is the basin and K is a metal cylinder 6 x 7 inches with a hollow core formed of a 3-inch metal tube, as indicated by the dotted lines. The cylinder contains, roughly, nearly 3½ pints of water. Fig. 2 shows one of the lamps with a metal guard of 3½ inches and fixed on an ordinary holder with a switch combination. These lamps go on at each end of the cylinder as shown in Fig. 1. The radiant heat of the lamp communicates

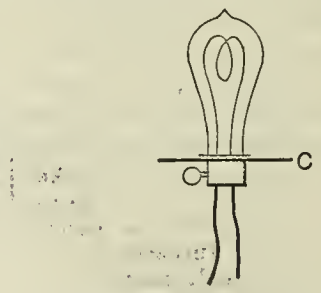


Fig. 2.—Lamp with Metal Guard.

to the water by means of the metal surrounding it. About 75 per cent. of the electrical energy is efficiently utilized this way in heating the water and about 10 per cent. additional is retained in the metal. The two lamps shown in the sketch are ordinary 16 candle power, running on a 100-volt circuit. If the cylinder is made of thin copper the time

that the water will take to boil is about 45 minutes; then one lamp can be switched off and the other lamp will evolve enough heat to keep the water at boiling point till wanted. The lamps can be easily fixed on the ends of the cylinder by suitable clips catching on the metal shield of the lamp holder C. Fig. 3 explains itself. The only difference between it and the plan shown in Fig. 1 is that there is no inner tube and a coil surrounds the lamps instead of a water jacket. The inside diameter of the coil should be 3 inches or a little more than the diameter of the lamps used. If "J. R" goes to any electrician he will get a suitable device by means of which the wires connecting the lamps can be taken to the desk of his customer in the office so that he can himself control the heating of his lavatory water.

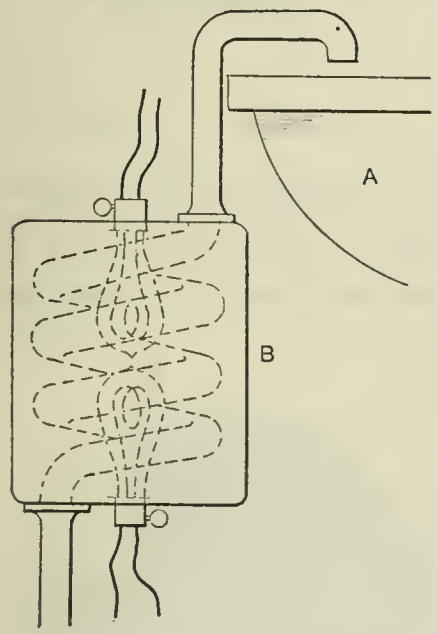

Fig. 3.—Basin with Coil in Cylinder.

Blackened bulb lamps, whose light giving properties are impaired, can be economically used in the cylinder for heating.

Anti-Freezing Mortar.

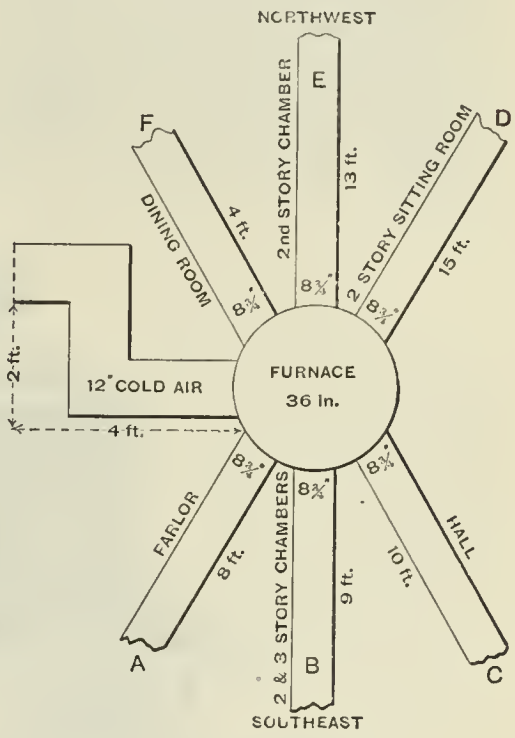
From G. H. W., *Takoma Park, D. C.*—In *The Metal Worker* of February 16 a correspondent of yours asks for a frost proof mortar. A recent item in a technical journal, translated from an Austrian publication, gives the result of a series of experiments on the subject, and states that Portland cement mortar mixed with a 7 per cent. solution of salt water and laid with dry brick or stone gives satisfactory results, lime mortars or mortars containing lime being of no value. The *American Architect* advises, as the result of experience, that the stone or brick used should be heated, likewise the mortar, the object being to retard the freezing sufficiently to permit the cement to set. A furnace such as is used in making asphalt mixtures for floors or paving can be successfully used for the purpose.

A Cold Air Duct.

From J. H. R., *Munhall, Pa.*—In *The Metal Worker* of February 2 I find described by "J. S.," Pittsburgh, Pa., a very admirable form of cold air duct and light shaft combined. While not wishing to criticise, I beg permission to offer one alteration which I believe would render it more complete. It is that the slide B should be made in the form of a sash, so that at all times, whether closed or open, light may be transmitted to the cellar. I hope this suggestion may meet the approval of the inventor.

Which Is Best For Furnace Tops?

From J. C., *Cleveland.*—We would be very much pleased to receive the opinion of the readers of *The Metal Worker*, also the results of their experience, in taking hot air pipes from the top of the casing hood on furnaces. We have adopted this plan for the past year, and we are now experiencing some trouble, and we lay it to this method of piping. We make our hood from 7 to 10 inches high, perfectly flat top, with a 2-inch sand ring. We notice the majority of furnace manufacturers show in their illustrations of different furnaces that pipes are taken from side of hoods, but our understanding of this method is that their furnaces are too high to use any other way. Our trouble has been that we do not obtain the force of hot air from the registers that we ought with a good hot fire, having furnace properly arranged, cold air duct and pit of ample size. Any information that your readers can give us through your valuable paper will be thankfully received.



Making An Oil Tank.

From J. G. F. W., *Indiana.*—Replying to the inquiry of "W. R. T.," who asked about an oil tank in *The Metal Worker* of February 16, I would make a box 16 inches square and 8 feet long, and then line it throughout. It is easier made and will stand rougher usage. The best size of pipe to use is 1 inch galvanized wrought iron.

Trouble with Furnace.

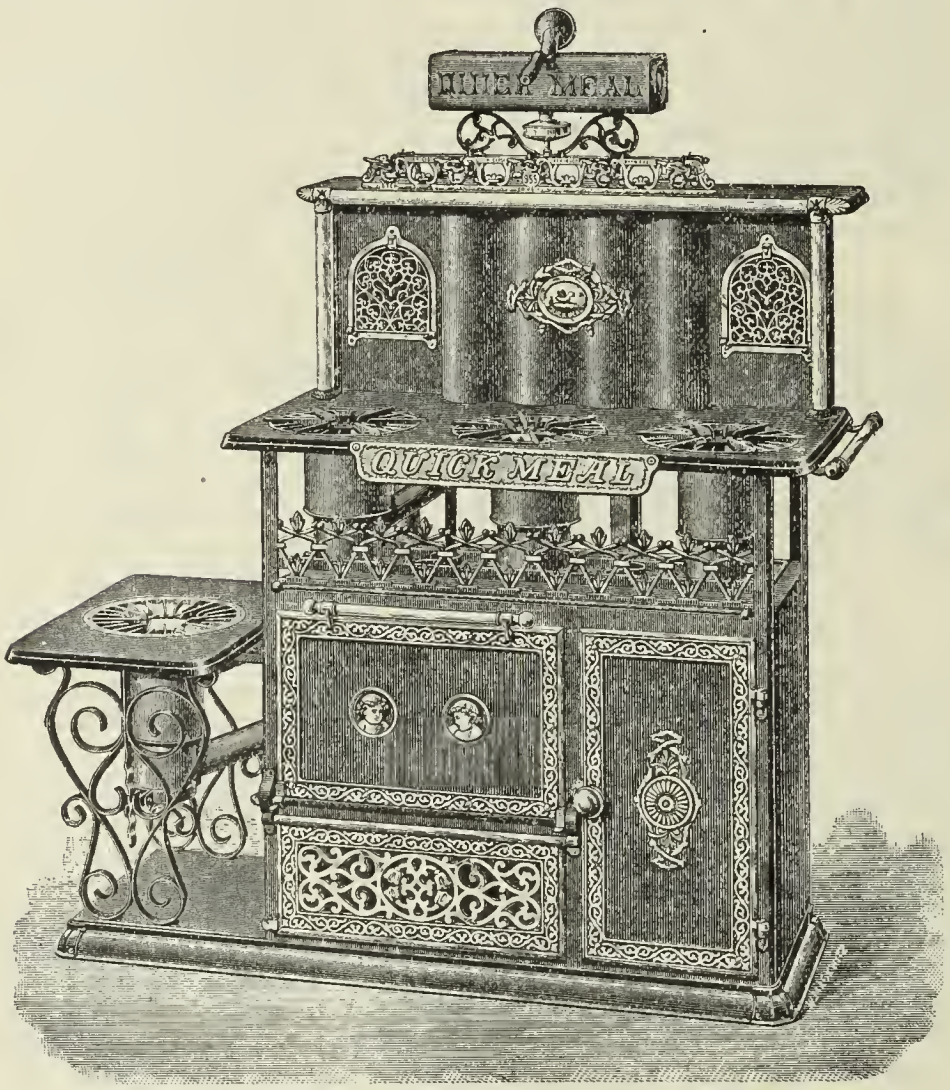
From DEALER, *Philadelphia.*—I inclose the plan of a house heating furnace as put in by a customer of mine. The work was well done, as it was intended to be a sample job. The furnace operates in a manner different from any I ever heard of and is a puzzle to the customer and myself. The furnace is 36 inches in diameter, has six 8¾-inch heating pipes and a 12 inch cold air supply. The house is protected by a dead wall on one side and has a 4-foot yard on the other. Pipe A leads to the parlor, is 8 feet long, and cold air comes out of this pipe. Pipe B leads to second and third story chambers, is 9 feet long, and operates properly. Pipe C leads to the hall on first floor, is 10 feet long, and remains cold. Pipe D leads to the back sitting room in second story, is 10 feet long, and operates properly. Pipe E leads to chamber in second story, is 13 feet long, and operates properly. Pipe F leads to dining room on first floor, is 4 feet long, and gets hot last.

Answer.—An inspection of the plan inclosed by our correspondent shows there are six 8¾ inch heating pipes leading from the furnace to the upper rooms. The area of a pipe 8¾ inches in diameter is approximately 60 square inches, so the combined area of the six pipes would be 360 square inches. The cold air supply pipe is 12 inches in diameter, and has an area of 113 square inches, approximately. It is usual with furnacemen to have the cold air supply equal to three quarters of the combined area of the heating pipes. Following the above rule, the cold air supply pipe should have an area of 270 square inches, or 157 more than a pipe 12 inches in diameter. In order that the furnace should have a proper supply of cold air, a rectangular pipe 12 x 22½ or a round pipe 18¾ inches in diameter would be the size required. By holding the hand over the parlor register it may appear that cold air is coming up, when it is really passing

Trouble with Furnace.

down, as can be determined by holding a lighted match over the register. As the cold air supply is not sufficient to give the proper amount of air to the furnace, some of the pipes do not operate, while one or more of the pipes may allow the cool air from the floor to pass down to supply the deficiency. For a remedy it is suggested that the cold air supply be enlarged as indicated above and the sharp turns removed from it. It is natural for hot air to flow to the highest point of escape, which accounts for the pipes to the upper rooms being heated.

Enameling Gasoline Stoves.



From J. G. F. W., *Indiana.*—In reply to "W. R. T.," whose inquiry appears in *The Metal Worker* of February 16 respecting enameling stoves, would say: Remove all the dirt by scraping, then wash all over with gasoline to remove the grease; then apply Bonnell's Nubian Enamel. If it is too thick, thin it with turpentine, and if too cold, set the can in hot water. A better way still is to unbolt the top and send it back to the factory, where it can be baked on and a better job made.

Troubles are believed to be again on the point of breaking out in the pottery industry of Trenton, N. J., owing to recently introduced reductions in the wage scale.

THE RETAIL STORE.

The Quick Meal Gasoline Stove.

The Ringen Stove Company of 414 and 416 North Broadway, St. Louis, Mo., have incorporated a number of interesting improvements in their line of Quick Meal gasoline stoves for the season of 1895. Prominent among these may be mentioned the balanced oven door, which is claimed to work without noise and is so adjusted that one finger will open or close it. The weight working inside of the flue is connected direct to the hinge of the door, thus balancing it and saving it from breakage. When the door is closed the weight swings out of the flue, so that while baking is in progress there is nothing in the flue to obstruct it. Another feature for this year is the Quick Meal tank, which is provided with a detachable and cleansible float. No packing is used and all the joints are metallic. The heads on the tank are not only soldered, but are doubly seamed on a special machine made for the purpose. The drip valves are provided with stuffing boxes, which prevent leakage in case the valves become worn from long use. The stove is constructed with a steel base formed like the front, and, it is claimed, will never break. In the case of the step stoves the base extends entirely under the range and step, thus adding to the general appearance of the stove. The grates are loose so that they can be taken off, leaving the stove top smooth and easily cleaned. In the accompanying illustration we present a view of what is known as the Quick Meal No. 955, which the company are offering for family, hotel or restaurant use. It has three burners in the top surface and an extremely strong one under the step. There are also two under the oven, making a total of six. The general appearance of the range is improved by a nickel towel bar and polished nickel plated rail along the top edge of the high shelf, which is supported by polished nickel plated uprights. This line of ranges is constructed of cold rolled steel and is of first-class workmanship throughout.

Quick Meal Stove No. 955.

The Yankee Sprinkler.

The Cleveland Lock Company, Cleveland, Ohio, are introducing the lawn sprinkler shown in the accompanying cuts. The sprinkler is made in one piece, with a cord for drawing it around on the lawn. The hinge shown in Fig. 1, at the top of the device, is raised to throw a half circle, as in Fig. 2, and is laid flat to produce a full circle of spray, as in Fig. 3. It is explained that the sprinkler has a sprinkling capacity of from 35 to 40 feet in diameter, according to the pressure; that it

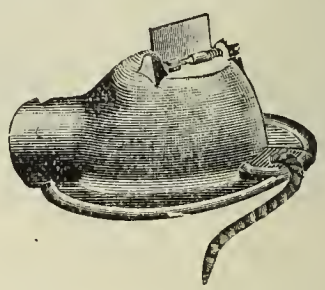


Fig. 1.—The Yankee Sprinkler.

can be placed close to the sidewalk (Fig. 2) and not wet passers by, and that it can be moved over the lawn by the cord without turning off the water or wetting the feet. It is claimed that

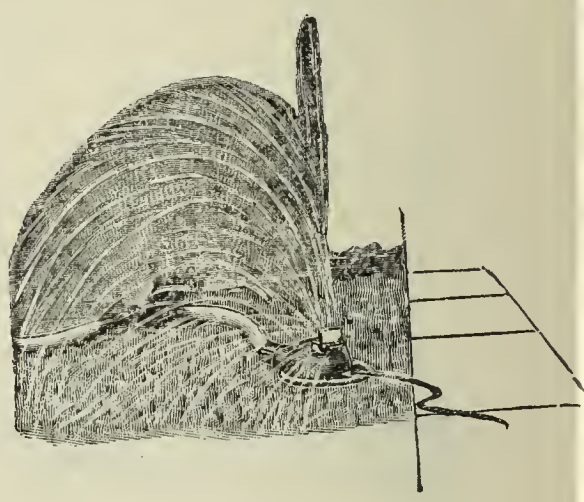

Fig. 2.—The Yankee Sprinkler's Half Spray.

there are no revolving parts or small holes, thus leaving an opening in the sprinkler the same size as that in the coupling, so that there is no back pressure on the hose. The sprinklers are

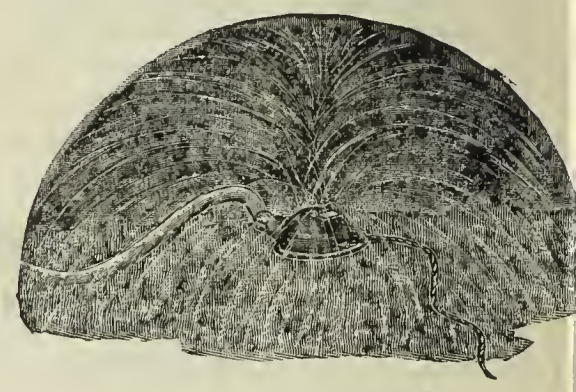

Fig. 3.—The Yankee Sprinkler's Full Spray.

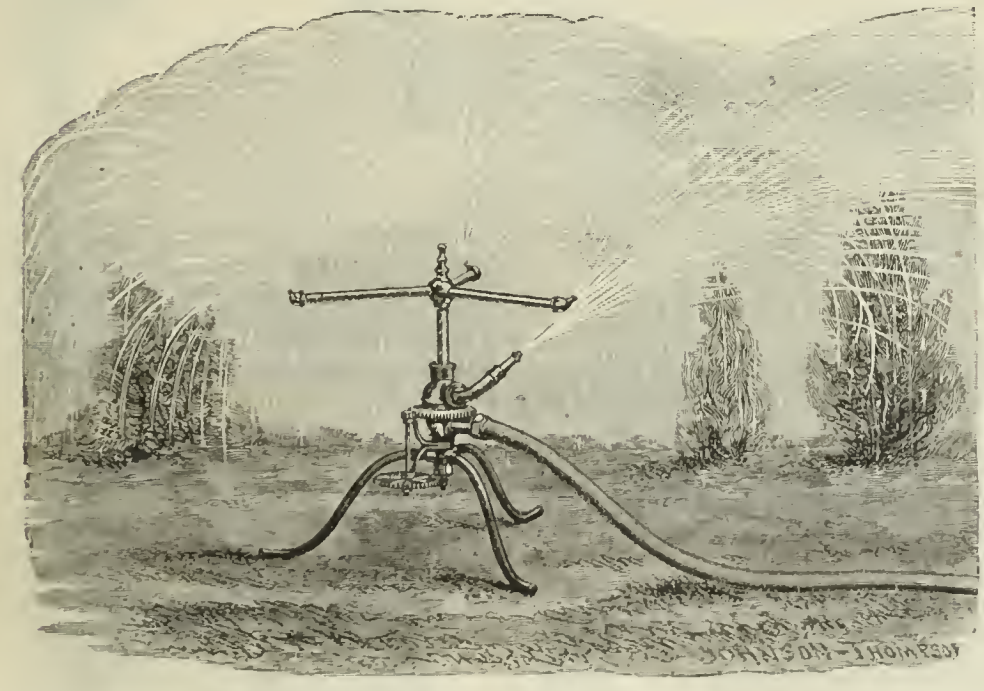
furnished japanned and galvanized, packed one in a box, complete with cord and a rubber washer.

S. M. PORTER is fixing up a building on Main street, Bristol, Conn., with a view to opening a tin and stove store, also a plumbing department. The firm name will be S. M. Porter & Sons.



Kitchen Time Table.

The following table is issued by the Oven Thermometer Company of Ironton, Ohio, and as being of possible interest to our readers we present it herewith.

Beef, sirloin rare	400	degrees per lb	8 min.
" " well done	450	" "	12 "
Bread, white loaf	450	"	50 "
Biscuit	750	"	5 "
"	650	"	10 "
Cake, fruit	450	"	2 hrs
" sponge	350	"	45 min.
" loaf	350	"	45 "
" layer	550	"	10 "
Cookies	750	"	5 "
Chickens	400	"	2 hrs
Custards	550	"	30 min.
Duck	400	"	2 hrs 30 "
Fish	400	"	40 "

Rolls	500	"	30 "
Turkey	400	"	3 hrs
Veal	550	"	1 hr 30 min.

The Comet Lawn Sprinkler.

E. Stebbins Mfg. Company, Brightwood, Mass., are putting on the market the lawn sprinkler shown in the accompanying cut. The sprinkler, except the legs, is made of solid brass, well nickel plated. The device is made with the globe or body in two parts, and by means of the swiftly revolving arms and intermediate gears the upper half of the body is made to revolve slowly around, carrying the hose nozzle, from which a large stream of water is thrown far out beyond that thrown by the arms, thereby covering, it is claimed, four times the space covered by the ordinary form of stationary sprinkler. It is stated that with an ordinary force of water the sprinkler will thoroughly sprinkle a space 80 feet in diameter; that the hose nozzle and the tips on the ends of the arms are adjustable so that it can be adapted to as small a space as is desired, and that the sprinkler is substantial, durable and attractive in appearance.

The Comet Lawn Sprinkler.

Standard Fiber Ware.

The Standard Fiber Ware Company of Mankato, Minn., have issued a circular describing improvements recently made in their goods. They have had expert chemists working for the best possible water proofing and finish, and believe they have it. They have also had expert machinists at work on a pail which will have the elasticity, strength and durability of the wound flax fiber pail, without its weak bottom. The new pail is called a truss bottom pail, being made with the bottom in a separate piece. The bottom is convex in shape, with a dished rim fitting inside the lower part of the pail. A steel band is fitted over the edges of the bottom and the pail body, which is then placed under powerful steel rollers. They compress the bottom and side into one compact body, the parts being so completely united that they cannot come apart. The convex shape of the bottom strengthens that part of the pail, and also prevents it from coming in contact with the floor or ground.

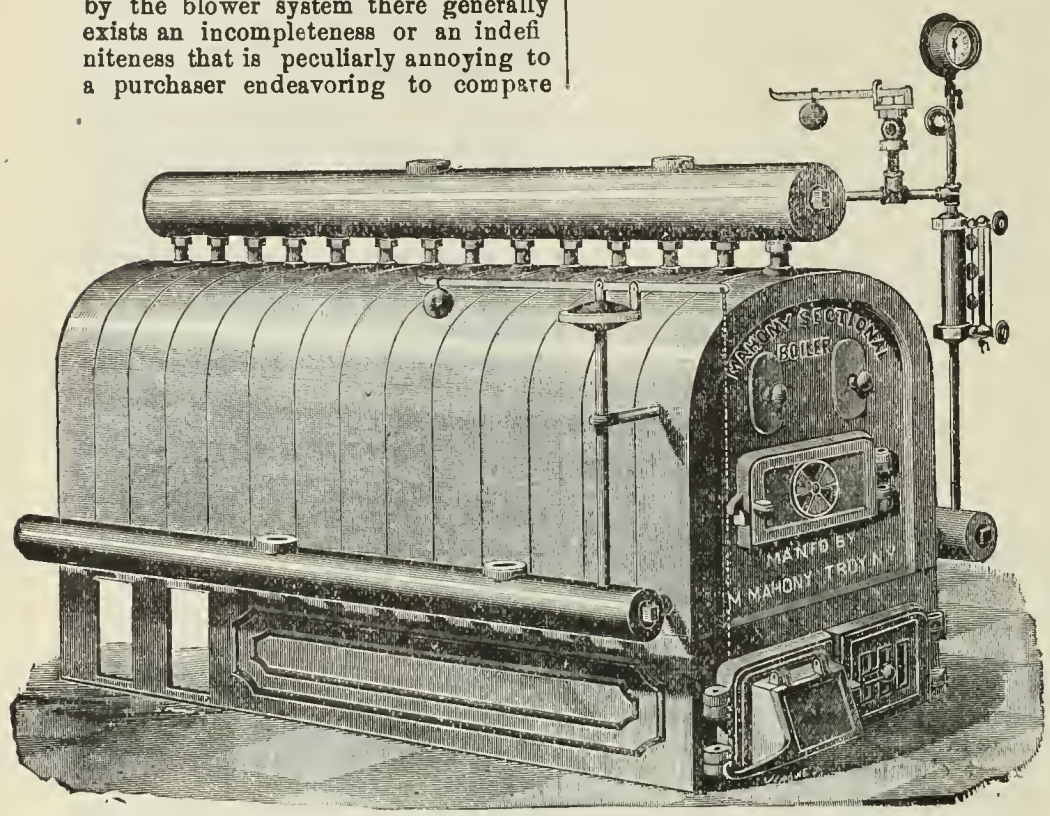
Steel Mortar and Brick Hods.

The Geauga Foundry & Mfg. Company, Painesville, Ohio, have recently put on the market Ohio water tight steel mortar and brick hods. The bodies of the hods are described as folded from a single piece of sheet steel without cutting the metal and as being reinforced on the edges and at the dumping point. The hods are provided with a malleable iron fork and wooden shoulder saddle, allowing the user to attach cloth, if desired, to the under side of the saddle. The malleable fork is provided with a socket for holding a hardwood handle, the socket being so constructed as to allow the shrinkage of the handle to be taken up and to readily replace a broken handle. The hods are furnished black or galvanized and are shipped knocked down.

MEMORANDA.

The Bradley & Hubbard Mfg. Company, with factory and offices at Meriden, Conn., have issued circulars calling the attention of the trade to some of their heaters. Among these may be mentioned the Orient heater, embodying a novel application of the mammoth central draft lamp, supplying both heat and light at the same time and at very little cost; also the B. & H. oil heater, having Russia iron drum and nickel plated finish. This heater is said to be of sufficient capacity to warm a good sized room, and that the lamp can be used for lighting purposes by removing the cylinder and holder and putting on a No. 89 B. & H. chimney.

Manning, Bowman & Co., 57 Beekman street, New York, announce that they have decided to remove to new quarters on May 1 next. In the interval they will offer their New York stock, including staples and regular goods, as well as some lines from their inventory, in old patterns and job lots, which will be closed out complete at quotations to please close buyers. They state that after removal all orders will be shipped direct from factory to customers. They believe that the trade will be equally well served in this way, all their staples and new goods being on exhibition at their showroom, while salesmen will call upon customers as heretofore. Due notice will be given concerning their new location.



The Cleveland Stamping & Tool Company, Cleveland, Ohio, manufacturers of Solid Steel Seamless Hollow Ware, issue a supplementary catalogue for 1895 in which is shown a line of Hollow Ware made from cold rolled wrought steel, highly tempered, including Spiders, Griddles, Broilers, Kettles, Scotch Bowls, Stew Pans, &c. The company advise us that their regular catalogue will be ready about April 1.

The distress among the settlers in some parts of Western Kansas has been so severe that the people have been eating horseflesh, not being able to get other food. They are training their cows to draw plows, &c., and by this means the farmers hope to be able to put in a crop this spring.

STEAM AND HOT WATER.

Blower Specifications.

From W. S. N., *New York.*—In the specification of apparatus for heating by the blower system there generally exists an incompleteness or an indefiniteness that is peculiarly annoying to a purchaser endeavoring to compare prices. One bidder may give the size of the fan wheel, while the other gives only the nominal size of the fan housing. One may describe the heater as of so many lineal feet "capacity," another may clearly specify the exact number of feet of pipe. Even when an expert has drawn the specifications they are not always as definite as they should be. It is not at all unusual to find a fan indicated only as to be sufficient to deliver a certain amount of air, with neither speed nor power stipulated, or again an impossible combination of volume, air pressure and horse-power may be demanded. It would appear that under ordinary conditions the exact size of the fan wheel and its general construction should be specified as well as the actual size of the heater.

The Mahony Vertical Section Steam or Water Boiler.—Fig. 1.—Showing the Boiler Arranged for Steam.

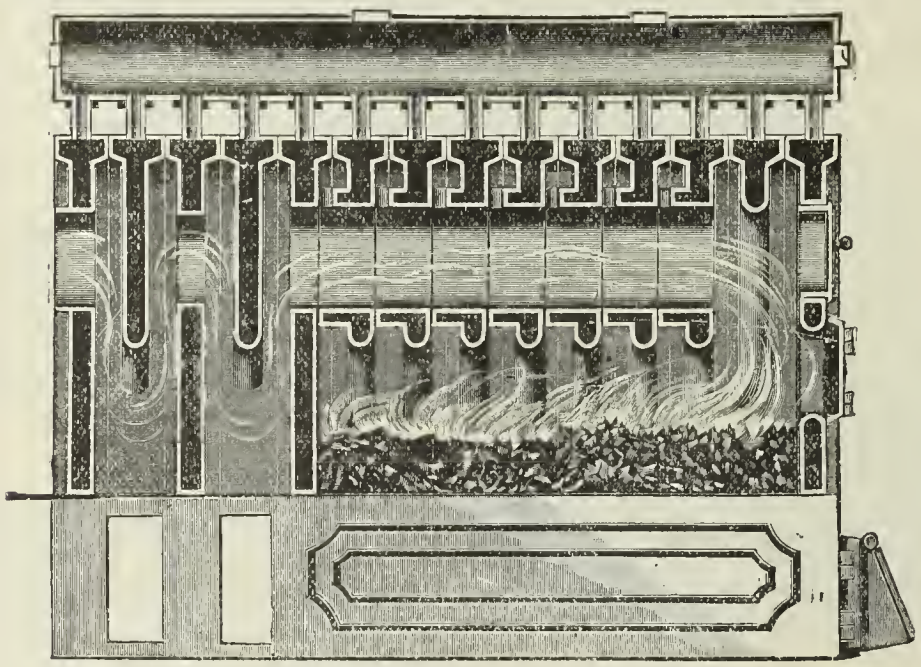


Fig. 2.—Longitudinal Sectional View.

The Metal Worker was favored this week with a call from James A. Harding, who takes a hearty interest in the welfare of the American Society of Heating and Ventilating Engineers.

The Mahony Vertical Section Steam or Water Boiler.

One of the latest boilers brought out is the Mahony vertical section boiler for either steam or water, made by M. Mahony, Troy, N. Y., and which is shown in the illustrations herewith. Though it is now being offered to the trade generally for the first time, it has been under test for the past two years. The special features claimed for the boilers are vertical water ways, large fire surface, and the arrangement of the flues to utilize the heat of the gases. Fig. 1 shows a general view of the steam boiler with the draft regulator, steam gauge, safety valve and water glass.

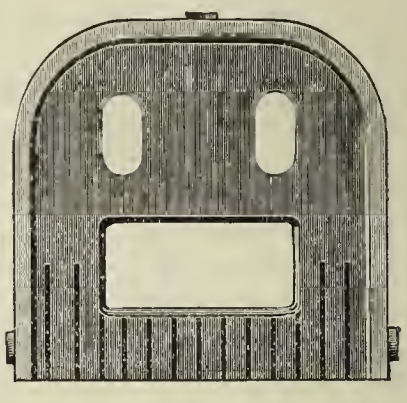

Fig. 3.—Front Section.

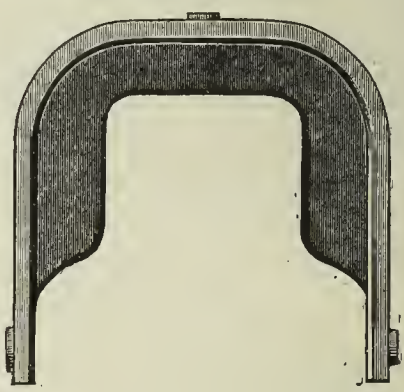

Fig. 4.—First Section Over Fire.

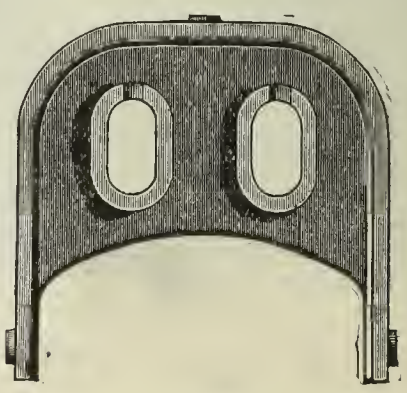

Fig. 5.—Section Over Fire.

Fig. 2 is a longitudinal sectional view of the boiler at the center showing the arrangement of the sections and the course of the products of combustion as they pass through to the chimney. Fig. 3 shows the front section of the

boiler with openings for cleaning the flues and for the feed door. Fig. 4 shows the first section over the fire, designed to permit the gases to pass up to the flues in the sections over the fire which are shown in Fig. 5. Fig. 6 shows the back section of the fire box with the outlets to the rear flues where the draft is made to take alternate down

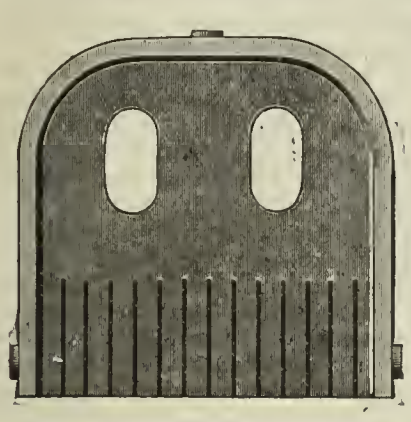

Fig. 6.—Back Section of Fire Box.

and up turns by first coming into contact with the rear down draft section shown in Fig. 7, and passing down, then rising to pass through the opening in the rear up draft section shown in Fig. 8. The back section with the smoke outlet is shown in Fig. 9. The boiler is increased in size and capacity by the addition of both fire and flue sections,

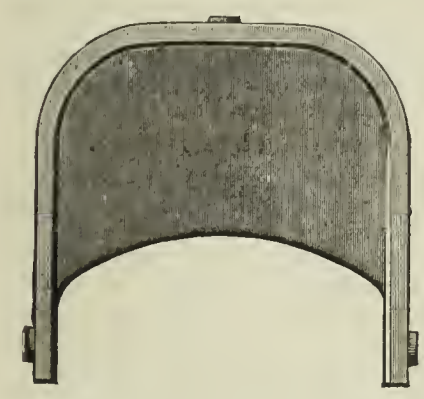

Fig. 7.—Rear Down Draft Section.

Figs. 5, 7 and 8. The sections are all independent of each other, and are connected by nipples with a return header at each side at the bottom, and a flow header or steam drum at the top. The boiler is provided with a grate that is composed of sections, for air space and durability, connected so that by work-

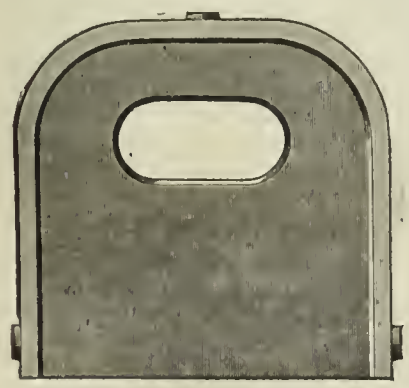

Fig. 8.—Rear Up Draft Section.

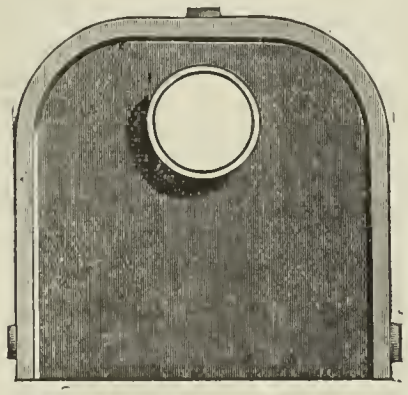
ing a lever all parts of the fire are subject alike to a cleaning when the grate is oscillated. The boiler is made in five sizes, with a fire box 31 inches wide and increasing 6 inches in length with each size from the first, which is 38 inches long; the different sizes made with 10, 12, 14, 16 and 18 sections having respectively 8, $9\frac{4}{10}$, $10\frac{3}{4}$, 12 and $13\frac{1}{3}$ square feet of grate surface. The boilers are rated to carry 1600, 1800, 2100, 2400 and 2700 square feet of direct steam radiation, and 2700, 3100, 3600,



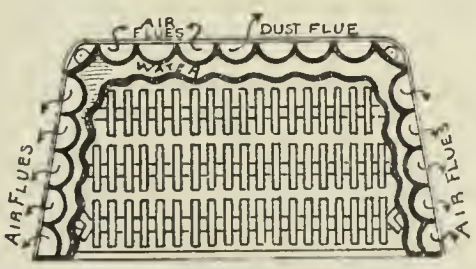


Fig. 9.—Back Section.

4000 and 4500 square feet of direct hot water radiation. The hight of the boilers is 6 feet. A new catalogue giving full details of the boilers is ready for distribution.

The Popular Hot Water Fire Place.

Our readers will be interested in the Popular hot water fire place which is being manufactured by Wray, Weitzel & Robinson, Bellwood, Pa. Fig. 1 is a plan view of the fire place at a level of the grate showing the water section and the air spaces. Fig. 2 shows a sectional elevation of the fire place and pipe connected with two radiators on the floor above for heating two rooms by direct radiation, while the fire place is arranged to heat one room on the first floor by heated air currents and the other from the fire direct and also by hot air. The fire place is made in three sizes, Nos. 1, 2 and 3. In the No. 1 the lower section only is used for water heating, while the upper section, which is exposed to the heat from the fire, is capable of heating a large volume of air. This size, it is claimed, has a capacity for carrying from 75 to 100 feet of radiation. In No. 2 both the top and bottom section, as shown in Fig. 2, are used in heating water and are rated for carry-

The Popular Hot Water Fire Place.—Fig. 1.—Plan View at Grate.

ing from 150 to 200 feet of radiation. In No. 3 the fire surface of the grate is increased so that a capacity for carrying from 200 to 250 feet of radiation is claimed for it. All sizes are arranged for using $1\frac{1}{4}$-inch flow and return pipes. In this construction all the advantages of a grate as a means of ventilation are claimed and the positive heat from direct radiation is realized, and by means of the water circulation the heat can be distributed as desired. It is further mentioned that these grates can be set and used in connection with either steam or hot water heating plants, connecting the same as with ordinary radiators. The grate is intended for private residences, public buildings and school houses, where it is said to change the air in the room as often as twice an hour, and, through the circulation of the heated air which enters, all parts of the room are kept equally warm. In describing the apparatus the point is made that there is no ventilation in a flue unless it is heated, and that the use of one of these grates makes an excellent assistant to an overtaxed hot water system, affording both additional heat and positive ventilation. For use in houses

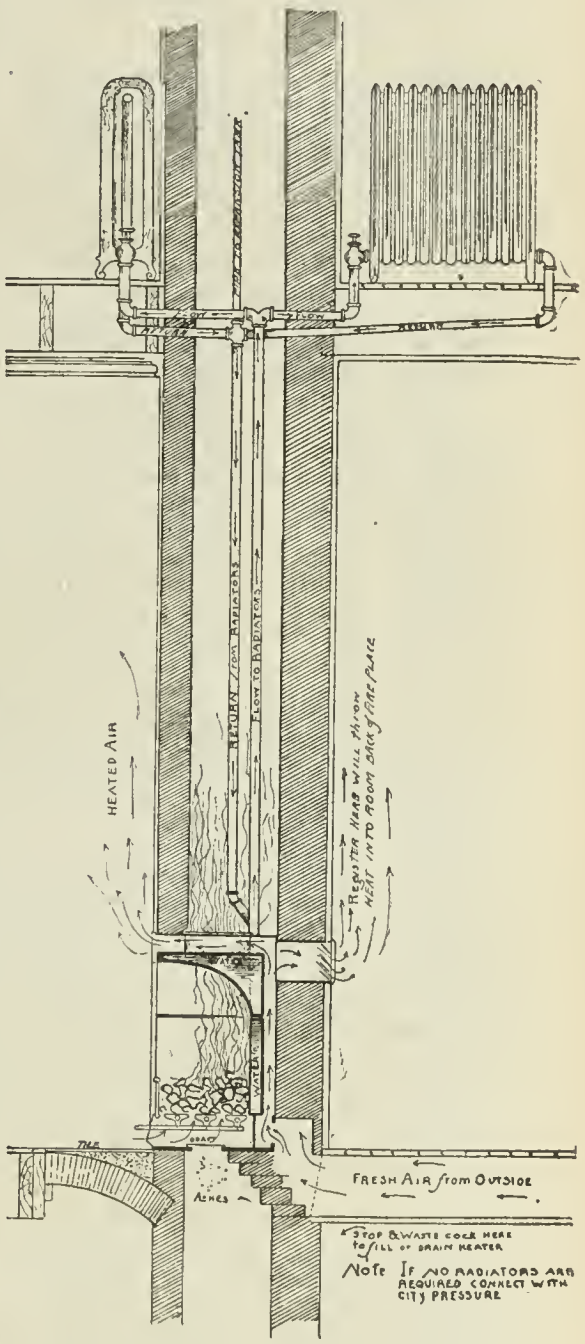

Fig. 2.—Sectional View with Radiators Connected.

where there are steam or hot water heating plants in the spring and fall, before the larger apparatus is started, the grate is said to possess special advantages. The claim is made that a large percentage of the heat generated from the fuel is realized by this system of grate heating.

An ordinance has been introduced in the Philadelphia City Council authorizing the Pennsylvania Heat, Light & Power Company to lay conduits and to use any street or alley in the city not actually occupied by a street passenger railway, and whose width does not exceed 40 feet, except to cross such streets, or to use them longitudinally where it is necessary in order to construct a continuous line. The com-

pany agree to furnish heat free to all police and fire stations, and at the city's request to any city building at a cost equal to the cost of the fuel used during the preceding year. A letter which accompanies the ordinance gives the incorporators as William B. Page of Albany, Robert Reaves, C. N. McKinney and John Taylor of Scranton, and James E. Hayes of Camden.

Hot Water Heating.*

BY JAMES MACKAY OF THE AMERICAN BOILER COMPANY.

I am pleased to be with you at this, the opening meeting of your proposed course of lectures upon practical subjects. Having gained some experience from many years of close and intimate acquaintance with the tongs and with the stocks and dies, and having passed through the various stages of steam fitter's helper and worked for years as a journeyman steam fitter, I feel, as I stand before you this evening, very much at home among you.

You no doubt are aware that I am expected to give a short talk upon hot water heating, which, if treated exhaustively, is a subject that involves a great deal more than can be even briefly outlined in the short time at our disposal. From a practical standpoint, however, we may, with profit, go over its record and its history ; take up its different methods of practical application ; trace its various stages of progress and improvement, step by step, from the earliest time at which we have any authentic record of its use up to the present time, when we find it one of the most important factors in the heating business of our country.

There are in the United States today over 10,000 men actively engaged in the sale, manufacture and erection of goods used exclusively in hot water heating, such as heaters, radiators, radiator valves, air valves, union elbows, expansion tanks, pipe, fittings, pipe hangers, floor and ceiling plates, bronzes and enamels, and when we realize that ten years ago there were not 500 men so engaged, an idea of the growth and present importance of the industry may be obtained.

The Most Ancient Apparatus.

In ancient Rome, over 1800 years ago, hot water was employed as a means for supplying artificial heat, and traces of its use for the same purpose are being at the present time unearthed from the ruins of the buried cities of Pompeii and Herculaneum. The only difference between modern practice and that of our ancient brothers is that we use iron while they used brass pipes arranged in coils, substantially the same in form and pattern as they are built by us today.

Now, while we have no positive or authentic records to show that this system of heating was used continuously or from time to time in some part of the world between the first and the eighteenth century, still it is reasonable to suppose that such was the case. In any event, we know that hot water was used in France about the year 1777 for heating incubators and brooding houses, and it appears at that time to have developed a high degree of efficiency, for it attracted considerable attention, was adopted and successfully used for heating purposes by several of the most prominent and practical men of that day.

* Read before the Steam Fitters' Protective Association, at Chicago, February 18, 1895.

Early English Heating.

From France, hot water heating found its way to England, and prior to the year 1825 was quite extensively used for heating greenhouses, conservatories and dwellings of the better class. From this time on it grew rapidly in popular favor, and was used for heating all manner of public and private buildings. Various systems of piping were employed, some of them good and some bad; but out of this experimental practice grew our modern knowledge of the subject.

One of the first arrangements of circulating mains of which we have any detailed or accurate description was a single main 3, 4, or 5 inches in diameter, ascending from the top of the heater, and from this the different branches were taken to supply coils located in different parts of the building. Each coil had one connection only, practically the same as a steam radiator is connected to-day. It was expected that the hot water would flow along the top of the main into the coils, and that the cold or return water would flow along the bottom of the connection into the main, thence along the bottom of the main into the top of the heater. This arrangement was speedily improved upon by adding a second or return connection to each coil, and connecting them with a second main, which was in turn connected with the bottom of the heater, thus providing a separate flow and return main, and producing what is now known as a two-pipe hot water job. It may be safely said that all our modern systems of piping were evolved from efforts equally as crude.

The heaters used in those early days were nearly all made of pipes, fitted in the shape of coils into furnaces of various forms, some of them being built of bricks, while others were incased in iron shells or jackets. The coils themselves were made of wrought iron pipe and sometimes of cast iron or copper. In all cases they were made exceptionally heavy and strong and were tested to very high pressures.

High Pressure System.

This precaution was very necessary, as almost all of the work was put in upon what is now known as the "high pressure" or "closed tank" system. The expansion tank was located, as it now is, at the highest point in the system, but instead of providing a safety valve or fusible plug as a factor of safety the apparatus was filled with water from the top of the expansion tank, and as soon as the desired hight of water was obtained a plug was screwed into the opening, and the entire apparatus tightly sealed up. The temperatures carried in the water under this arrangement varied from 230° to 350°, and those temperatures were uniform, or nearly so, throughout all parts of the system. The pressure maintained was also very high, and great trouble was experienced in keeping the joints tight. This system of heating served its purpose well, however, and continued to grow in public favor. The piping and other details of the work were continually being simplified and improved upon. The open expansion tank system was also introduced, and it proved very satisfactory and efficient, until, at length, about the year 1850, what was considered a high degree of excellence was attained.

Introduced in America.

About this time the system was introduced into America and was used more especially throughout the colder sections of the country for heating greenhouses. In the provinces to the north of us, owing to the extreme cold climate, it grew in great favor and was used for heating all kinds of buildings, especially large public structures and greenhouses.

My first introduction to the business was as a helper upon a large greenhouse job. The boiler, or heater, was what is known as a "Saddle Back." It was made of wrought iron and was set upon a brick arch or fire chamber. This type of boiler has long since practically fallen into disuse, though some manufacturers are still offering it for sale. The heating surface placed in the greenhouse itself was 4-inch cast iron pipe of the usual pattern. The joints were put together with rubber rings, which fitted tightly around the end of the pipe, and were thick enough to fill up the hub of the next length when the end and the hub were brought together. This made a water tight joint which was easily put together or taken apart; it was also fairly durable. One lineal foot of 4 inch pipe to each 2½ square feet of glass was put in. This proportion proved ample to maintain a temperature of 60° in the house when the outside temperature was 15° below zero. I never knew what temperature was maintained in the water of this apparatus, but as it was an open expansion tank system and the tanks were located only a few inches above the heating pipes, the temperature in the water could not have been high.

Water Tube Boilers.

At this time a great many water tube boilers were used. They were made of 1½-inch extra heavy wrought iron pipe put together with heavy gray cast iron fittings, and were of various forms and sizes to suit all manner of conditions. One of the most popular and efficient constructions was a boiler made in the same way as an old fashioned box coil. It was put together with open pattern return bends, and was brought together at the top and bottom by large headers or branch tees connected with right and left threads in the usual way. This boiler was made from 30 to 36 inches wide, 6, 8, or 10 feet long and about 4 feet high; the dimensions varying according to the capacity required. As it had a large amount of surface exposed to the direct action of the fire, and as almost all of this was horizontal or bottom surface, which the rays of heat, gases and other products of combustion came in contact with at right angles, it developed a very high rate of efficiency. However, it was hard to clean, and being incased in brick work, was difficult to get at for repairing.

Other Forms of Boilers.

Tubular boilers were also used. They were the familiar tubular construction, except that they were filled up with tubes to withim three or four inches of the shell. In practice this construction was not found as efficient as the water tube boiler. This was owing to the limited amount of direct fire surface and the large amount of flue surface. In order to make the tubes or flue surface effective, the grate surface had to be increased to such an extent that it was out of all proportion to the requirements as represented by the radiation, and in many cases the bottom rows of tubes were not effective. Then, again,

if for any reason it was necessary to force the fire, the gases escaping into the chimney were at a very high tem perature, representing considerable loss. It was also found that these boilers rusted out very rapidly during the season when they were not in use; and with light firing that the circulation in them was sluggish. While this type of boiler is still to a certain extent in use, it cannot, in my opinion, be said to represent the best practice. Other boilers were constructed of cast iron in various forms, all on the sectional principle. Some of them were quite effective, while others had grates altogether too large for the heating surface over them. The poor ones were sifted out and cast aside, while those possessing merit survived. But it is a strange fact that at the present time we find manufacturers who ought to be better informed rehashing some of the old cast aside types of sectional boilers and putting them upon the market as new constructions, only to have them fall by the wayside as time goes on. To be properly proportioned for hot water heating a boiler—or to be more correct, a heater—should contain from 60 to 75 per cent. of direct fire surface and from 25 to 40 per cent. of flue surface. In small heaters, say up to 4 square feet of grate, there should be 1 square foot of grate to every 20 or 25 square feet of heating surface.

Proportioning Boiler Surfaces.

In large heaters, up to 8 or 10 square feet of grate, the proportion can be much larger, say 1 square foot of grate to every 30 or 35 square feet of heating surface. The value of heating surface in its relation to amount of radiation supplied depends a good deal upon its arrangement in the heater and the way in which it is presented to the action of the fire and gases. With ordinary efficient surfaces, the grate area being proper, 1 square foot of heating surface in small heaters will take care of from 6 to 8 square feet of radiation, and in large heaters, from 10 to 15 square feet. Some years ago we used in lieu of modern radiation box and wall coils of various shapes. You are all familiar with their construction, and I have no doubt have put in many hard days' work making and testing them. It is in this particular branch of heating that great improvements have taken place. The modern cast iron vertical sectional radiator, being neat, compact and ornamental, is more in keeping and will harmonize better with a modern interior than the old style coils, though I think the latter more effective, foot for foot, than the former. For hot water heating efficient plain surface radiation only should be used. Extended surfaces are expensive and inefficient, and should not be used, especially if the apparatus is to be operated at a low temperature.

Kinds of Radiation.

There are three kinds of radiation in common use—viz.: Direct, indirect and direct-indirect. The last two named are used more especially for ventilation. In apportioning the amount of radiation required for any given exposure account must be taken of the temperature at which it is proposed to operate the apparatus, bearing in mind that the lower the temperature at which proper results can be obtained the better will be the quality of the heat and the greater the economy of fuel. I should recommend that a hot water heating apparatus be capable of maintaining a temperature of 70° during coldest weather, with a temperature in the water not to exceed 160°. Under those conditions a larger amount of radiation would be required than if a higher temperature were carried, but it would be more satisfactory to all parties concerned. The outside wall and glass exposures in any room or building exert the greatest influence in lowering the temperature therein, and for this reason they should be considered as the most important factors in apportioning radiation. The cubic contents also must be considered and good judgment used to ascertain how many cubic feet of air will have to be warmed per hour due to the change of air that may be effected through properly provided channels or through badly fitting doors and windows.

Apportioning Radiation.

The wall surface may be reduced to its equivalent in glass surface and the whole figured as so much glass, or each factor may be treated separately. The latter plan I consider best. In apportioning direct radiation to a given room, in which it is intended to maintain a temperature of 70°—and in the water of the heating apparatus, a temperature of 160°—it has been my experience that 1 square foot of radiation to each 60 cubic feet of contents, 1 square foot to each 2 square feet of glass and 1 square foot to each 8 or 10 square feet of outside wall will do the work properly. Great care must be exercised in judging as to the exposures, construction of the walls and fitting of doors and windows, together with any local conditions which might affect the result, and due allowance made. If a temperature of 200° be carried in the water the radiation may be decreased about 20 per cent.

To ascertain the amount of direct-indirect radiation required for any given room, the usual method is to ascertain the amount of direct radiation required, and to this amount to add 25 per cent. I have found under these circumstances that each radiator should have a cold air duct of an area in the ratio of 40 square inches to each 100 square feet of radiation. This duct should be brought through the wall a little above or below the radiator, so that it will make a right angle turn before entering the base of the radiator. It should also be accessible for inspection and cleaning purposes. Air can be delivered through a direct-indirect radiator at a velocity of about 3 feet per second.

Indirect radiation is usually apportioned by adding 50 per cent. to the amount of direct radiation required. This calculation would answer if wrought iron surfaces were used, but it is entirely inadequate for heating purposes if cast iron indirect radiation, taken at its commercial rating, is used. In such a case I should recommend increasing the amount required for direct radiation 100 per cent.; then the amount will not be found any too liberal.

Size of Air Ducts.

The warm air ducts from indirect radiators, if discharging upon the first floor, should be as near as possible 1¼ square inches in area for each square foot of radiation in the radiator to which they are connected. If discharging upon the second floor, 1¼ square inches in area to each square foot of radiation should be provided, and 1 square inch in area to each square foot of radiation if discharging upon the third floor. The cold air duct should be from 25 to 33 per cent. smaller than the warm air duct, and the radiator should be so incased that all of the incoming air will pass over every inch of the heated surface. There should be an air space above and below the radiator, that above being at least 20 per cent. larger than that below, and the lower space should not be less than three times the area of the cold air duct. The warm air should be discharged on the opposite end from that at which the cold air is admitted.

There is another factor governing the sizes of direct and direct-indirect radiators, upon which we have not touched—that is, as these radiators heat entirely by convection, warming the air to a given temperature, a certain quantity of air will be required to produce certain results, either in warming or ventilating. Under known conditions, the velocity of the air passing in at the air duct can be calculated, and the duct so proportioned as to deliver the proper quantity of air; then the radiating surface must be apportioned according to the amount of air it will warm per hour, regardless of its relation to the direct radiation, as before described. One square foot of indirect radiation at a temperature of 160° will heat 87 cubic feet of air per hour from zero to 70°. In order to attain this efficiency large amounts of air must be passed over the radiator. In large rooms where the air is changed from four to seven times per hour, even better service can be obtained. Indirect radiators should be arranged in groups as compactly as possible, and in connecting them with the mains they should be favored so as to maintain proper circulation with light as well as with heavy fires. A properly erected hot water heating apparatus, on heat being applied at the base of the column of water, will circulate uniformly throughout the system of piping and radiation. This circulation is due to the cold column of water descending and displacing the heated water, which ascends through the piping into the several radiators, where it is cooled and returned to the source of heat. The point at which the return mains are connected to the heater should be the base of the column of water, and the point at which heat should be applied.

Systems of Piping.

There are many systems of piping in use, and experience has taught us that they are all good under some conditions. The two-pipe system is possibly better known than most of the others. It consists of two mains—a flow and return. Sometimes they are carried direct from the heater to the different divisions of the work, and in such cases small pipe is used. At other times two large trunk mains are used, from which branches are taken to the different parts of the building. In this system the mains usually ascend from the top of the heater, rising about 1 inch in 8 feet, although it is quite common to cause the flow mains to descend from the top of the heater, venting the high point into the expansion tank. In such cases the extreme end of the flow main is connected through a small pipe into the return opening of the heater, and the return main commences at the point where the first connection is taken from the flow main and runs parallel to it around the basement, receiving the return connections in the order in which they are supplied from the flow main and returning them to the heater in the same order—*i. e.*, the first radiator supplied is the last returned to the heater, and the last supplied is first returned. The size of the

main is governed by the amount of radiation supplied. If it is long and exposed, 1 square inch in area should be allowed for each 100 square feet of radiation. If short and compact, the area of a 1-inch pipe will be found sufficient for every 100 square feet of radiation supplied.

When very large mains are used, trouble sometimes occurs through internal circulation in the main itself, and for this reason I would recommend that nothing larger than 5 or 6 inch pipe be used in any main. If greater area is required than this will afford, divide the work and use two or more 5 or 6 inch mains.

Overhead Piping.

The overhead system of piping is also much used. With it all of the water is carried in a large riser to the top of the building, where the main is distributed to different parts of the work, and descends to the basement through single drop mains called risers. The radiators are placed, as far as practicable, immediately above each other, so that they can be conveniently connected to one of these drop mains, both flow and return connections being at the same end of the radiator, the flow at the top and the return at the bottom; both are connected to the same drop main. No air valves are required, as all air is vented through the top connection of the radiator into the riser. The horizontal mains diverging from the top of the main riser descend about 1 inch in 10 feet, thus making this point the highest in the system of piping. Above it is located the expansion tank, connected with an expansion pipe from the bottom of the tank into the side of the most convenient horizontal main. A vent pipe is also taken from the extreme highest point in the main and connected with the side or top of the expansion tank above the water line. By this arrangement all air from the system is discharged into the tank.

It is not a bad plan, especially if the tank is located only a short distance above the main, to put it under a slight pressure and maintain an air cushion in it. Years ago it was the custom to govern this air cushion by a common ball cock, sometimes placed in the tank and at other times cased up at the side of it. In appearance it was not unlike an automatic water feeder. Of late years, however, automatic air valves have been used for this purpose, but it cannot be said that they properly answer the purpose or that they are reliable. In the basement the risers are connected into the side of the return main, which is carried around the basement and connected with the bottom of the heater. The area of the main in all its parts should be equal to the area of a 1-inch pipe for each 100 square feet of radiation supplied. Radiators may be tapped ¾ inch up to 40 square feet, 1 inch up to 70 square feet, 1¼ inches up to 125 square feet; larger than this, 2 inches.

Single Circuit System.

One of the oldest systems of piping used for hot water heating is known as the single circuit or one pipe system. It is exceedingly simple, and where suitable is very effective. It consists, as its name implies, of a single main, which, starting from the heater, is carried vertically as high as the ceiling will permit, then turned and carried as a horizontal main around the basement in a continuous circuit, having its highest point where it leaves the vertical pipe, and descending about 1 inch in 10 feet until it reaches a point immediately at the rear of the heater, where it drops and is connected with the return opening of the heater. If the heater is located in a position that is central to the work, two circuits may be taken from the vertical pipe and carried in opposite directions around the basement. Flow connections to radiators and risers are taken from the top of this main, and return connections brought into the side of it.

The expansion pipe from the bottom of the expansion tank should be connected with the bottom of the heater, and a circulating pipe taken from the top of the highest point in the main and connected to the side of the expansion tank below the water line. The size of the main for this system should not be less than 1 inch in area for each 100 square feet of radiation supplied, and it should not be reduced in size at any point. Air valves are necessary on all radiators. Up to 50 square feet radiators may be tapped 1 inch; up to 100 square feet, 1¼ inches; up to 200 square feet, 1½ inches; larger than 200 square feet, 2 inches.

In all work due provision must be made for expansion and contraction. To my mind a square elbow from the top of a main to lateral branches compensates better for expansion than a 45° elbow.

In the class of work under discussion theory furnishes us many valuable lessons, but I think one pound of practice is worth ten pounds of theory, and you, gentlemen, who are actively engaged in the practical details of the work have more and better opportunities to acquire a thorough knowledge of the art than any who depend upon books and theory entirely.

James D. Mowry.

James D. Mowry, for the past 15 years president of the W. H. Page Boiler Company, died at his residence, 256 Broadway, Norwich, Conn., last week, after a sickness of several weeks. He was an old and respected citizen and had in his long and memorable life been identified with many local enterprises. He had been agent of the Chelsea Mills and of the Rockland Mills prior to 1865. He started the Mowry Machine Company, was for years secretary of the Page Wood Type Company, and finally their president. In 1857 he took an active part in arranging for the bi-centennial celebration of the settlement of the town, and was a member of two committees that contributed to the success of that memorable event.

He was a loyal citizen and during the dark days of the Rebellion did what he could to promote the cause of the Union. At the opening of the war he was a member of a committee for the raising of a war fund. In 1862 he contracted to furnish the Government with 30,000 rifle muskets of the latest Springfield construction. The barrels were made at Cole & Walker's, Franklin street, the locks by C. B. Rogers & Co., and the other pieces at Mowry's factory in Greeneville. In 1854 he was the leader in the movement to connect Greeneville and Preston with a bridge, and as the result of his labors witnessed the erection of the first bridge across the Shetucket River at that point.

He was a member of Somerset Lodge No. 34, F. and A. M., and a member of the Elms Club. He was a man of kindly disposition and pleasing personal qualities, and was highly esteemed by those who knew him. Mrs. Mowry, his daughter, Mrs. Frederick T. Mason, and his son, Col. William C. Mowry, survive him.

HEATING NOTES.

The McCormack Steam Heating Company, Wallingford, Conn., lighted their building with electricity last week for the first time. The plant was put in by the Standard Storage Battery Company of Northford and is said to give satisfactory results.

Samuel Burns was a caller at *The Metal Worker* office this week. Mr. Burns is secretary and manager of Thomas W. Weathered's Sons, 139 Centre street, New York, manufacturers of hot water boilers and greenhouse constructors.

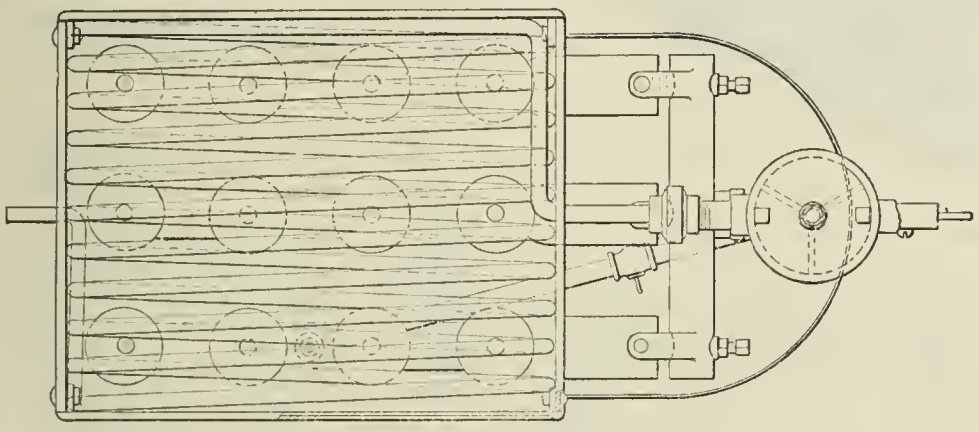
A patent has been granted to C. A. Ball, Washington, D. C., for a radiator so constructed that only such proportion of the radiating surface may be used as is necessary for the work, special valves and diaphragms securing the result.

The Connecticut State Board of Health have adopted a plan for ventilating the State Prison and the work of installation will be done by the inmates.

In commenting on heating greenhouses, using gas for fuel in a hot water heater, Thomas Fletcher makes the following statement in an English journal: "A span roof house, protected from winds, size 20 feet square, 12 feet to ridge, required, in one year, a total gas consumption of 34,000 cubic feet to maintain a minimum of 45° with a hot water system. It is quite out of all question to expect to heat a good sized conservatory with gas for anything approaching three times the cost of coke. Under equally good conditions as regards economy, 1 pound of good dry coke is equal to 19 cubic feet of 18 candle gas, and at the prices paid here—*i. e.*, 4 shillings ($1) per 1000 cubic feet, this quantity of gas would cost 1 penny. At its present price, 13 shillings ($3.25) per ton-coke would cost one-fourteenth part of this, and although in practice the figures would come out much more favorably for gas fuel, the difference would still be prohibitive, except on the smallest scale."

George C. Blackmore of the United States Radiator Company, Saltsburg, Pa., called at *The Metal Worker* office this week.

The Vosburgh cast iron patent adjustable floor thimble and ceiling plate combined is the subject of an elaborately decorated poster issued by the N. O. Nelson Mfg. Company, St. Louis, Mo., who make it. The poster, measuring 11 x 15 inches, is printed in colors and in a circular panel in the middle is a view of the Vosburgh thimble in place. The only text relating to it is: "No argument is necessary. It speaks for itself." On the back of the poster are prices of the No. 1 and No. 2 sizes. The former has a range of from 9 to 16 inches and the latter of from 15 to 22 inches. The device is made for all sizes of pipe from ¾ to 4 inches.



The John W. Mills Company, 100 Lake street, Chicago, are to move to 93 on the same street, having secured a portion of the showroom occupied by the Niagara Radiator Company.

C. B. Matteson, manager of the Chicago office of the J. H. McLain Company, has resigned his position with the above company, and is to enter the employ of the American Boiler Company as city salesman.

PLUMBING and GAS FITTING.

Clarke's Instantaneous Water Heater.

Those who cook with gas and others who require hot water, particularly in summer, will be interested in Clarke's instantaneous water heater, the patents for which are controlled by the Gilbert & Barker Mfg. Company, 82 John street, New York, who are just putting it on the market. It is designed to completely take the place of the range water back and kitchen boiler. It may

Clarke's Instantaneous Water Heater.—Fig. 1.—Plan View.

be placed at any convenient spot in the cellar kitchen or elsewhere and connected with the cold water supply to the building. The hot water service may then be run the same as from a boiler to all of the fixtures in the house where hot water is required. It has been tested in connection with a water service carrying 125 pounds of pressure, with the water supply at 40°, and furnished water at 130° temperature at the rate of one gallon per minute. Fig. 1 shows a plan view of the heater with the heating coil with the burners under it and the controlling valve, which is one of the features of the heater. Fig. 2 shows a longitudinal sectional view of the heater and the valve construction. The general adaptability of the heater is largely due to the fact that gas is burned only when water is being drawn. The gas is turned on or off by the mere act of drawing water. The valve arrangement, shown in Fig. 2, is like a direct acting steam pump. At one end is a cylinder, containing a piston actuated by the flow of water. The water from the supply is admitted under the piston and taken out above it. When a faucet is opened anywhere on the hot service, whether it be close to the heater or hundreds of feet away, the flow of water instantly raises the piston. At the other end of the piston is arranged a direct acting gas valve which opens immediately on the piston being raised by the water and lets on a full supply of gas to the burners under the heating coil, where a pilot light instantly flashes the burners into use. The coil is made of 32 feet of ½-inch seamless drawn copper tubing and is placed in an iron case 12 inches wide, 15 inches long and 10 inches high. The heater is 30 inches long, including the valve, and stands 15 inches high.

Since the bind of the stuffing nut under the piston will vary with the pressure of the supply on different floors of a building, a counterpoise is furnished which can be set at any required point on the valve lever to aid in closing the valve when a faucet is closed. The variation of quality and pressure of gas in different towns and on different floors of a building is anticipated, and needle valves are provided, which may be adjusted by hand when the heater is installed. By this arrangement a sufficient velocity and quantity of gas is secured to induce a proper amount of air to enter the bell-shaped atmospheric burner chamber. The quantity of water drawn can be reduced by the user at the faucet, so that water at a much higher temperature than that mentioned can be obtained. By reducing the quantity drawn it remains in the heating coil over the burners a longer time. When used in public places, like barber shops, hotel washrooms, &c., the temperature and quantity of the water drawn can be regulated by placing a stop cock on the supply to the heater and setting it, as found satisfactory by experiment. The burner is divided into three sections, each having four flame jets burning 10 feet of gas apiece when the burner is in full operation. With this heater it is claimed that hot water can be secured promptly at any time of the day or night in such quantities as desired. It is also pointed out that no large body of hot water is stored in a boiler to give an uncomfortable temperature to the apartment in summer. It is claimed that it is far more economical to heat the water wanted as it runs and then stop the use of fuel than to store a quantity of boiling water to waste a large percentage of its heat continually. The comfort derived from cooking by gas in summer has led to many kitchens being heated by some other means than the cooking apparatus so that gas may be used in the winter. It is claimed that the difficulty in securing hot water under such conditions is overcome by the Clarke hot water heater.

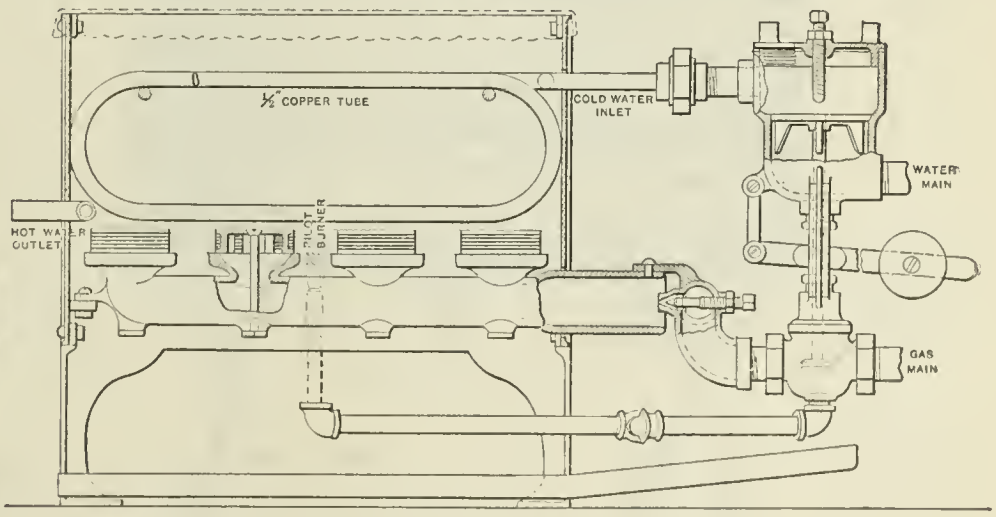


Fig. 2.—Sectional View.

Association News.

Connecticut Plumbers' Association.

President J. B. Weiant of the Connecticut Association of Master Plumbers has appointed the following committees for 1895:

Sanitary Committee: Robert Morgan, New Haven; F. A. Curtiss, New Haven; H. B. Middlebrook, Bridgeport; John M. Page, Naugatuck; S. H. Beard, New Britain.

Legislative Committee: J. S. Craig, Hartford; James Ahern, Hartford; James F. Duffy, Hartford; James Donovan, Middletown; Lyman D. Mills, Middletown.

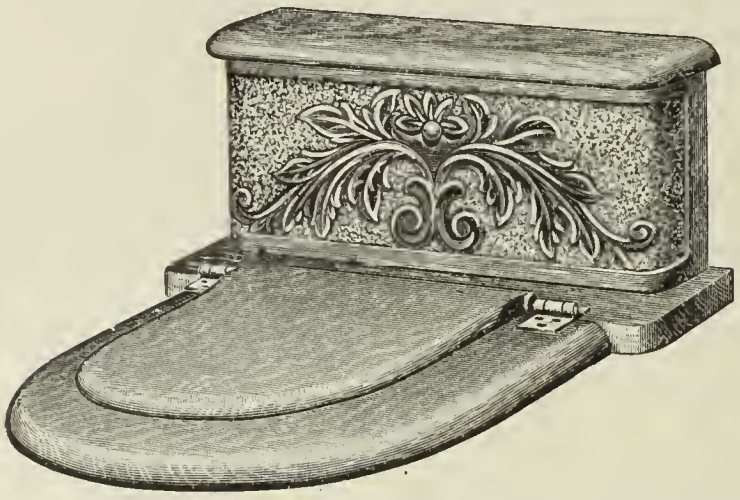
Essay Committee: L. H. Mills, Bridgeport; A. Troland, Norwich; J. G. Shearlock, New Haven; Wm. Vanderman, Willimantic; G. W. Washburn, Danbury.

Apprenticeship Committee: S. E. Dibble, New Haven; Thos. D. Barlow, Waterbury; Francis J. Reynolds, Ansonia.

THE MASTER PLUMBERS' ASSOCIATION of Augusta, Ga., held a meeting last week and was addressed on the subject of "Sanitary Plumbing" by Health Officer Christman. The latter invited a committee of the association to meet the Board of Health at its next meeting, and the Sanitary Committee, consisting of Lewis Willenbecher, F. E. Whitesell and E. B. Evans, was delegated for

this purpose. The Plumbers' Association has become a member of the National Association of Master Plumbers, has adopted a constitution and by-laws and will hereafter meet in Seagreaves' Hall, North Sixth street.

A NUMBER of Nebraska plumbers met recently at Lincoln and organized the Nebraska Master Plumbers' Association. The following officers were elected: President, James H. O'Neill, Lincoln; vice-president, John Rowe, Omaha; secretary, H. H. Gaffey, Lincoln; treasurer, B. C. Humphrey, Fairbury.



JOHN MITCHELL, president of the National Association of Master Plumbers, will respond to the toast "The National Association" at the banquet after the convention of the New York State Association of Master Plumbers, at Troy, N. Y., next week.

NEW YORK CITY will send a delegation of 14 plumbers, headed by President McDermott, to the State convention of master plumbers at Troy, N.Y., on March 5 and 6.

BIRKERY MFG. COMPANY, Hartford, Conn., manufacturers of the well-known Birkery ball cock, are distributing to their friends a very neat pocket match safe made of seal leather, and they advise us that any master plumber who may have been unavoidably overlooked and will send them a postal card will receive one by return mail.

High Grade Closet Fixtures.

Our illustrations show some of the many high grade seats and tanks for water closets. made by the Pfau Mfg. Company, 138–142 Hunt street, Cincinnati, Ohio. Fig. 1 shows the hand carved closet seat, and Fig. 2 the Roman pattern flush tank. These fixtures are furnished in different woods, light and red cherry, natural and antique oak, ash and walnut, all of which are made with a high grade finish, being water rubbed and given a piano finish. The closet seat is furnished with a back handsomely carved by hand and has finely nickle plated hinges. It can be supplied with or without the seat cover as preferred. The flush tank is provided with heavy polished or nickle plated brass brackets and a fine chain and pull. The tanks are made in three sizes, No. 0 being used as automatic tanks, No. 1 for use with washout and hopper closets and No. 2 for siphon jet closets. Several different styles of valves are mentioned as adapted for use with the tank from which the plumber can make a selection.

High Grade Closet Fixtures.—Fig. 1.—Showing the Hand Carved Closet Seat.

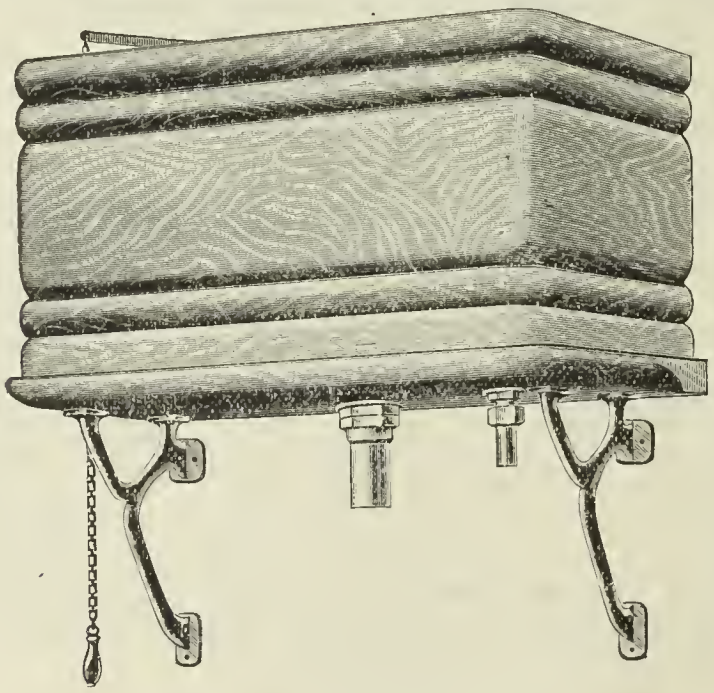


Fig. 2.—Roman Pattern Flush Tank.

A NEW and attractive business sign now appears over the door of 129 Beekman street, New York, which announces that A. Keller is conducting the business of stoves, French ranges, plumbing, steam and gas fitting, he having bought out the interest of his former partner.

TRAPS AND VENTS.

THE New York *Tribune* suggests that there exists a need for a water insurance company, to insure against damage done by bursted water pipes, whether caused by freezing, poor material or natural wear and tear.

BROWN BROS. have leased a store in the Barnard Block, Saginaw, Mich., which they will use for a plumbing establishment.

GEORGE MORLIDGE has opened a plumbing shop at 633 York street, Newport, Ky.

JOHN A. JACKSON is building a plumbing shop for Curran & Murray, at Baker and School streets, Morton, Pa.

ROBERT CLARK and THOMAS ELDER are preparing to open a plumbing establishment in the basement of the Howarth Building, on Seventh avenue, Beaver Falls, Pa.

WM. C. LOVE, Haverford, Pa., sustained a loss in his plumbing shop by fire of $2500, partly covered by insurance.

GEORGE F. HICKMOTT, for a number of years connected with the plumbing and metal trades and for some time past a dealer in plumbers' specialties and sheet metals at 152 Federal street, Boston, Mass., has associated himself with the Birkery Mfg. Company, Hartford, Conn., and will continue to visit the trade in the interest of the Birkery ball cock and several other specialties with which he has been identified. Mr. Hickmott is well and favorably known in this line and will have a hearty welcome in his new capacity.

COUNCILMAN TIMOTHY BRONSFIELD has opened a plumber's shop on Delaware street, between Fifth and Sixth streets, Leavenworth, Kan.

A LAW putting plumbing under the control of the Board of Health has been presented to the Legislature of the State of Delaware.

JOHN H. CABEEN, 38 Church street, Boston, Mass., had his plumbing establishment flooded by water thrown on a fire in an adjoining building.

T. F. BOHAN, Little Falls, Minn., has moved his plumbing shop to First street.

R E. HARRIS has purchased the old electric light building on East Calhoun street, Macomb, Ill. He will move his present building to the rear of his new purchase and occupy the entire space as a plumbing and steam fitting shop.

R. T. ALLEN, Bangor, Maine, has sold one half interest in his plumbing business to Robert D. Linn of Old Town.

ABEL P. RANDALL, Westerly, R. I., for many years with Robert Drysdale, will begin the plumbing business for himself March 1.

AT THE ANNUAL MEETING of the Bridgeport, Conn., Builders' Exchange, Zalmon Goodsell was elected president and Lucius H. Mills treasurer. Among the other members of the exchange who are plumbers are C. S. Eames, M. W. Manwaring, Edwin A. Creevey, F. & F. C. Booth, John Kearns, E Lynch, Pierce Mfg. Company, Green & Logan, Wheeler & Cook, H B. Middlebrook and Donahue & Bertilson.

THE BRIDGEPORT STEAM HEATING COMPANY, Bridgeport, Conn., are a well equipped plumbing supply house and have a large warehouse. They carry a

complete stock of water closets, urinals, bathtubs, lead pipe, drain pipe, steam and gas fittings, &c., and cut pipe to sketch. A new boiler and engine have been put in to supply the power needed.

THE PLANT of the Sperry Sewer Pipe Company. Akron, Ohio, has been sold to Harry Thompson, of that city.

THE NEW YORK STATE SEWER PIPE COMPANY of Rochester, N. Y., were incorporated on February 25, with a capital of $20.000. The directors named are W. H. Garsline, Ira L. Otis, Ed. W. Peck and Frsnk H. Kondolf of Rochester.

THE OPERATIVES on sanitary ware in the shops of the Trenton potteries are taking steps to resist the newly posted reductions in wages, which they say range fiom 25 to 50 per cent. A committee has been appointed to confer with the manufacturers in the hope that an agreement may be arrived at.

PLUMBER'S LICENSE has been taken out by William Nedvideck, 216 S. Third street, La Crosse, Wis.

THE plumbing and heating establishment of Hulett & Hsy, at No. 203 Sixth street, Rscine Wis., was visited by a $200 fire recently.

THE KALAMAZOO PLUMBING & HEATING COMPANY have begun business at 111 North Rose street, in the Chase Block, Kalamszoo, Mich. Fred. Herman will have charge of the plumbing department, Andrew Frey of the steam heating and E. S. Shepard of the office and general supervision.

C. L. HICKS, Waterbury, Conn., had a $1000 fire in his plumbing shop, which was covered by insurance.

DAVID J. MCKEOUGH has tendered his resignation as plumbing inspector to Mayor Gibson of Utics, N. Y., to take effect at the pleasure of the Board of Health. Joseph Frank, at present assistant inspector, is a candidate for the vacancy, and it is understood that his chances for the appointment are good. Mr. McKeough and his brother Thomas F. have engaged in the plumbing, steam and gss fitting and hot water heating business at 41 Columbia street, corner of Broadway.

WALTER N. FOSS of Augusta, Maine, a practical plumber and steam fitter, has connected himself with the firm of Sturtevant & Haseltine of Pittsfield, Maine, and will attend to that department of their business.

WILLIAM BISHOP'S SONS, 205 South street, New York, publish an illustrated catalogue calling attention to the many specialties which they manufacture and handle. Particular attention is given to William Bishop's patent pump water closets for use in vessels, either above or below the water line. Various closets are shown, likewise other ships' fittings, such as pumps, sea cocks, basins, deck plates, &c. As an indication of the extent of their business, they mention that in the past year they have supplied fixtures for and done work on over 400 naval vessels, steamboats, ferry boats, pilot boats, steam and sail yachts, beside doing a good deal of house plumbing.

THE WELL KNOWN FIRM of Hughes & Stephenson, Montreal, Canada, after a very prosperous business career of 16 years in the plumbing and heating business, have dissolved by mutual consent. They succeeded Richard Patton on his death, and the business, therefore, has been carried on without interruption for over 30 years. W. A. Stephenson retires from the firm and the business will be continued by J. W. Hughes, whose name will be familiar to our readers as a contributor to the columns of *The Metal Worker* for many years past. Mr. Hughes will have the valu able assistance of his son W. R. J. Hughes in carrying on the practical department. Mr. Hughes, Jr., besides having served a iegular apprenticeship at the trade and worked for several years as a journeyman, has had the additional advantage of a course in the New York Trade School, and is thoroughly familiar with modern methods of plumbing and practical sanitation.

A SERVICEABLE ARTICLE for desk equipment, in the shape of a glass paper weight, is being distributed by the E. Stebbins Mfg. Company of Brightwood, Msss. The paper weight is of glass and the possessor will have constantly before his eyes the reminder that when he has to do with plumbing work he should use Stebbins' Special faucets.

THE STRIKE of the workmen at the pottery of the Western Ssnitary Pottery Company, Tiltonsville, Ohio, has been settled, the demand of the employers for a reduction of 25 per cent. on the ssnitary pottery wage scale being withdrawn. The plant has been idle for some months, but about 3 weeks ago the management offered to resume operations if the men would accept the reduction referred to. The proposition was refused by the workmen, who went on strike. The plant is again in full operation.

UNDER the name or style of the Newell-Booth Company, Limited. A. T. Bootb, for many years with the Haines, Jones & Cadbury Company, manufacturers of plumbing supplies, Philadelphia, and Wm. H. Newell, also for many years connected with the same concern, but latterly engaged in business on his own account as a manufacturer of plumbers' specialties, have commenced business in the same line at the corner of Broad and Buttonwood streets, Philadelphia, in the building lately occupied by the Hook Smelting Works. The upper portion of the building has been utilized for their foundry, finishing shops and stock rooms, while the ground floor contains their showroom and office. The company propose to csrry in stock a full line of plumbing supplies, and will manufacture and introduce as soon as possible a few specialties for which their experience has taught them there is an opening. In a circular recently sent out to the trade the company pledge themselves to sell to the trade only. The new concern enter the market under favorable circumstances, and should very soon attain a prominent position in the business.

THE DAVIS & STEVENS MFG. COMPANY, Seneca Falls, N. Y., have just added a new specialty to their business in the manufacture of a new gas machine for regulating the burning of natural or artificial gas.

NOTICE IS ISSUED to the trade by George F. Bishop and James G. Bishop that under the firm name of William Bishop's Sons they are carrying on the business established 35 years ago by their father, the late William B shop. They have a branch store at 724 Third avenue, Brooklyn, and their main store and shop is at 205 South street, New York. They carry in stock a full supply of the latest msrine sanitary specialties and fittings and are in position to do ship plumbing woik of all kinds. The firm are also coppersmiths and steam fitters. In the circular which they issue attention is called to the ships' closets which they have put in various boats, their No. 1 Naval Closet being used in the United States Navy, and they give a list of a number of ships in which they are employed. They also refer to other closets and mention the names of many well-known yachts and vessels carrying them.

B. T. STEWART of Skowhegan, Maine, has made airangements to go into the plumbing business at Pittsfield, Maine.

A SIGN on tbe building at 5 East Nineteenth street, New York, proclaims that the Meyer Sniffen Compsny, Limited, will make a fine display of handsome plumbing fixtures as soon as the showrooms can be fitted up. Their line of modern sanitary goods has many attractions, and a visit to their exhibition, when completed, will doubtless prove pleasing and profitable to the plumber.

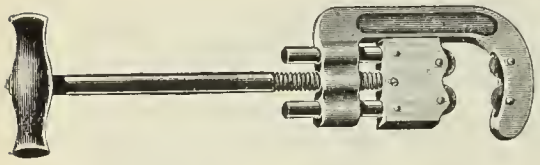
THE MASTER PLUMBERS' ASSOCIATION of Montreal, Canada, held their first annual banquet February 25 at the Queen's Hotel, about 150 membeis being present. The dinner was to celebrate the insuguration of the association and to emphasize its gratification at having received its act of incorporation. President Lamarche filled the chair in a most able manner and in a characteristic speech, or rather speeches, for he spoke in both French and English, in acknowledgment of the toast to the association, gave an account of the aims and wishes of its members, which include the promotion of good plumbing, the furtherance of the public health and the education of the people to the necessity of proper sanitation. At the left of the chairman was Acting-Mayor Alderman Leclerc, who is himself a "knight of the ladle and cloth," and on his right was Alderman Beausoleuil, chairman of the Board of Health, who in the course of an able speech promised the master p'umbers the aid and co-operation of the board. Speeches were likewise made by representatives of the leading manufacturing and supply houses of the Dominion, who promised cordial assistance to the association. Music was a feature of the banquet that was much appreciated.

THE DOLLAR GAS BILL before the New Jersey Legislature has been defeated.

DAYTON & CO. of Clinton, Iowa, have arranged for opening a plumber's establishment at Savanna, Iowa. They have rented the Bowman Building and will do all kinds of plumbing, gas and steam fitting, and keep a full line of supplies of all kinds.

WILLIAM B. GILCHRIST has purchssed the interest of his partner in the plumbing business at Wilkes-Barre, Pa.

THE BOSWORTH HEATING & SUPPLY COMPANY of Hartford, Conn., have changed their articles of association so as to enable them to deal in manufacturers' and engineers' supplies and all kinds of merchandise and machinery used by steam fitteis, gas fitters and plumbers.

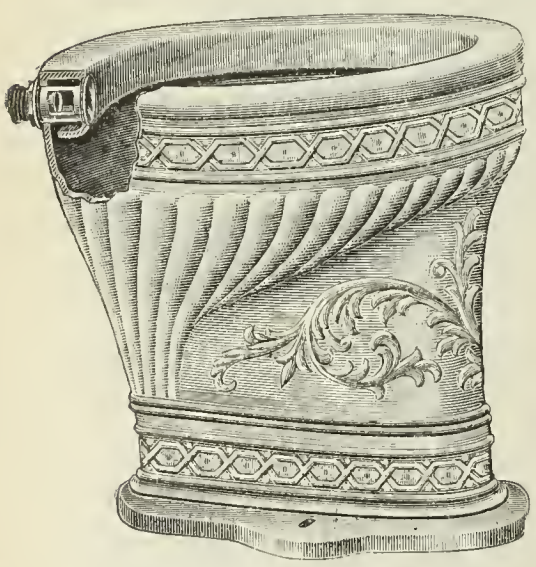


SAMUEL S. SINGLETON, a plumber and hardware merchant of Middletown, Conn., died last Tuesday of heart disease. He was 70 years old. He leaves a wife and one daughter.

DEAN WILSON, Chief Inspector of the Bureau of Plumbing, Buffalo, N. Y., says his crusade against plumbers

who had no license, or had failed to obtain a certificate of qualification, has been successful. He also says: "I don't want people to think that Buffalo plumbers are not as competent as any, for they are. They do as good work, generally, as is done in the United States, and the reputation of this city for good sanitary plumbing is excellent. The best plumbers, the leading men in the business, do all they can to assist in enforcing the regulations, and they greatly aid this department. If they didn't, we couldn't do the work cut out for us."

Four-Wheel Pipe Cutter.



The accompanying illustration shows a new form of pipe cutter brought out by the Vanderman Plumbing & Heating Company of Willimantic, Conn., and sold under the name of the Vanderman four wheel pipe cutter. The construction and operation of this tool are clearly shown in the illustration and no further description is necessary. The cutter is especially adapted for cutting cast iron soil and water pipe. It is made in three sizes, No. 1 being adapted to cut from 2 to 4½ inches, No. 2 from 2 to 6 inches, and No. 3 from 4 to 10 inches.

Four-Wheel Pipe Cutter.

The Hornless Water Closet.

The accompanying illustration shows a new form of closet made without a horn. The coupling passes entirely through the closet rim to the inside of the closet. The threads are in the middle, the outside nipple and lock nut being in one piece, so the same length is always attained. The frequent breaking of horns is what led to the invention of the closet by Thomas Kelly & Brothers, 124 Franklin street, Chicago, Ill. The date of the patents which have been allowed in the United States and Great Britain and are about to be issued is March 5, 1895.

The Hornless Water Closet.

HEATING AND PLUMBING.

NEW WORK AND CONTRACTS.

AN OMNIBUS APPROPRIATION BILL before the Minnesota Legislature provides $5000 for heating the Mankato School and also provides for the erection of two new school buildings.

BIDS will be received at the office of the Commissioner of City Works, Brooklyn, N. Y., until March 6, 1895, for plumbing work in connection with the alterations and repairs to be made in the offices of the City Hall now occupied by the Controller, Auditor and Board of Audit.

BIDS will be received at the office of the Commissioner of City Works, Brooklyn, until March 6, 1895, for furnishing and fitting up a steam heating apparatus in the Twentieth precinct police station house, &c., on the northeast corner of Hamburg and De Kalb avenues.

SENATOR PALMER has introduced a bill in the Connecticut Legislature to appropriate $5000 for heating and ventilating the New Britain Normal School.

A LARGE RAILROAD DEPOT is to be built at La Junta, Col., which is to have a heating and a plumbing system.

GEORGE SAUNDERS, Andover, Mass., has received the contract for ventilating the Musgrove Block, according to plans laid down by the State Inspector.

THE CONTRACT for plumbing the F. A. C. Club House, Fitchburg, Mass., has been let to John B. Farnsworth of Leominster, who did the plumbing for Lockey & Mayo's new block in Leominster. The contract calls for annealed brass tubing throughout and provision is made for a continuous hot water circulation.

W. H BARTHOLOMEW, New Haven, Conn., is to build a handsome residence to have a modern plumbing system and a hot water heating plant.

THE FOSKETT & BISHOP COMPANY, New Haven, Conn., have recently received contracts for placing Bolton hot water heaters in the residences of Hon. John F. Dillon, Far Hills, N. J.; C. A. Singer, Larchmont, N. Y.; Hon. W. Z. Larned, Summit, N. J.; Chas. P. Thompson and Geo. Stelzle, New Haven, Conn.

JAMES T. KAY, Meriden, Conn., is finishing up the heating of the new Center School. A new Economizer boiler, manufactured by the Porter Mfg. Company of Syracuse, N. Y., has been put in. Mr. Kay will also soon finish the plumbing and heating of the new Curtis Home. The plumbing is done in an elaborate manner, the best fixtures of the J. L. Mott Iron Works being used, with enameled baths and sinks, and everything in the most approved modern style.

KEEFE BROTHERS of Oswego have begun the work of heating and plumbing in the new hotel at Pulaski, N. Y.

WHITAKER & DUNLAP, Littleton, N. H., have received the contract for the plumbing in the new school house.

THE New Haven, Conn., town meeting, held last week, authorized the City School District, says the New Haven *Record*, to borrow a sufficient sum to make the amount available for new schools $180,000--$90,000 for the Grand Avenue School, $80,000 for the George Street School and $10,000 for the enlargement of the Winchester School.

THE KALAMAZOO PLUMBING & HEATING COMPANY, Kalamazoo, Mich., have the contract for plumbing and fitting the new Craver Block.

THE PLUMBING CONTRACT for School No. 7, at Rochester, N. Y., has been readvertised owing to some misunderstanding of the original bidders. The siphon closet of the J. L. Mott Iron Works has been specified.

A MASCOT STEAM HEATER, made by the United States Boiler Company, Detroit, Mich., is being put into the Ursuline Academy, at Santa Rosa, Cal.

THE HEATING APPARATUS at Hanover Park, Meriden, Conn., by which both the Casino and the merry-go-round buildings are heated, has given the most satisfactory service during the severe weather of the past few weeks. Both buildings are heated with steam. The plant was installed by Taylor & Taylor of Meriden, Conn.

A. D. WARD, Augusta, Maine, has completed the plumbing and heating plant in the Hill, Macomber & Wright Block.

SEALED PROPOSALS will be received at the office of the Supervising Architect, Washington, D. C., until March 22 for work, including the roof construction and roof covering for the United States Court House, Post Office and Custom House at Sioux City, Iowa. Drawings and specifications may be had from the Supervising Architect, Washington, or from the Superintendent at Sioux City.

THE L. H. PRENTICE COMPANY, 203 and 205 Van Buren street, Chicago, are to install a steam heating and power plant in the Mooney & Brisbane Building, at Main, Washington and Clinton streets, Buffalo, N. Y.

THE CHARLES H. SIMMONS COMPANY, 72 Market street, Chicago, have the contract for steam heating in the tenth to thirteenth floors of the Y. M. C. A. Building, 153 to 157 La Salle street.

KROESCHELL BROS. COMPANY, 41 to 59 Erie street, Chicago, have the contract for steam heating in the flat building of Philip Binne, North avenue, between Wells street and La Salle avenue.

THE SMITH & ANTHONY COMPANY, 219 Lake street, Chicago, have the contract for warm air heating in the flat building of Dr. Crissman, North Clark street.

SMITH & DONEY, 1046 North Western avenue, Chicago, have the contract for the plumbing and drainage in the flat building of W. Bubonon, Elston and Redfield avenues.

FRANK J. RUH, 1204 Diversey street, Chicago, has the contract for the plumbing and drainage in the residence of L. Mallern, 587 Orchard street.

JOHN WATSON, 1284 South Trumbull avenue, Chicago, is to do the plumbing and sewerage in the flat building of James Crosby, 1095 South Oakley avenue.

WILLIAM READ, 345 Forty-third street, Chicago, is to do the plumbing and drainage in the two store and flat buildings of C. Fiend, Fifty-first and Justine streets.

JAMES J. DOYLE, 6040 South Halsted street, Chicago, is to do the plumbing and drainage in the flat building of A. Smith, 3232 Fifth avenue.

TIN PLATES.

Is Overproduction in Sight?

A well informed correspondent in one of the Western States, who is largely interested in the American tin plate industry, has favored us with his views in regard to the prospects before the manufacturers of tin plates in this country. He gives as his impression, based upon rough calculations of productive capacity and consumption, that by the end of the current year the domestic manufacturers will have to face a strong home competition, caused by an overproduction of about 30 per cent. This theory is sufficiently startling at this early stage in American tin plate making, and it is deserving of some consideration.

The premises from which our correspondent deduces his statement, as given by him, are briefly these: The total consumption of tin plates in the United States is 6,000,000 boxes a year. The Standard Oil Company, the largest individual consumers, use 900,000 to 1,000,000 boxes a year, upon which they are allowed a rebate of 99 per cent. of the duty. This places them beyond the reach of the American manufacturer. The Pacific Coast trade amounts to between 500,000 and 1,000,000 boxes a year, which the Americans cannot touch on account of freight rates, the English manufacturers being able to ship so much cheaper by water. The dressed beef men who ship abroad are also entitled to 99 per cent. rebate on their shipments of foreign material, and they prefer buying foreign tin, owing to the fact that having both foreign and domestic tin plates in their factories would necessitate so many certificates, oaths, &c., to convince the Government that they are consuming imported tin only for their export business that they prefer to use foreign material altogether. Thus, all told, there are at least 2,000,000 boxes of tin plates consumed here every year which, it is argued, will always belong to the Welsh trade; at least until the conditions in this country approximate those obtaining on the other side. Accordingly, he estimates, only 4,000,000 boxes, in good years, are left to be fought for by American manufacturers.

Our correspondent calculates that there are at present mills enough in operation and in process of erection to make from 5,000,000 to 6,000,000 boxes per year. Consequently, he concludes, by the end of this year, the American manufacturers will have to face a home competition of an overproduction of 30 per cent. With this in view, he sees nothing encouraging to our domestic tin plate makers in the outlook, even if the building of new tin plate plants does not go beyond those already under contract.

It is difficult to estimate with any degree of accuracy the aggregate capacity of the tin plate works now in operation or in course of erection in this country. But, so far as we have been able to judge from a necessarily rough calculation, based upon reports of the proposed capacity of the new works now in process of construction—and these reports seldom err in the direction of under-estimation—their capacity, together with those of the existing works, will most probably not exceed the lower figure quoted by our correspondent—namely, 5,000,000 boxes per annum—and that only if the entire capacity was in constant employment.

Taking the other estimates presented as approximately correct, this would leave a possible surplus production of American plates amounting, in a good consumptive year, to about 1,000,000 boxes. But it is not unlikely that the figures given for the consumption that must for some time remain out of reach of the home manufacturers are rather above the mark. So far, at least, as they relate to the proportion of imported plates used in the oil and packing industries and re-exported, with the benefit of rebate of duty, in the form of cans, the estimate appears to be too high. Inquiry among the leading tin plate importing houses in this city, and consultation with one of the best informed individuals in the country in regard to the oil and canning trades, lead us to the conclusion that, at the outside, not more than 1,500,000 boxes of tin plates are re-exported yearly, including the greater part of the tin used on the Pacific Coast. This latter amount, which our correspondent places at between 500,000 and 1,000,000 boxes, cannot much exceed the lower figure. Last year's imports at San Francisco, according to the Custom House returns of that port, were only 213,000 boxes.

Moreover, the estimate of 6,000,000 boxes total consumption of tin plates in the United States in a good year, appears to be a decidedly low one. We have before us the record of tin plate imports for the past ten years, which shows that in the years 1889, 1890 and 1891 the numbers of boxes of tin plates brought into this country, calculated on a 14 x 20 full weight basis, were 6,733,840, 6,362,160 and 6,502,900 respectively. Last year, which was an exceptionally bad one for the tin plate trade, the imports reached 4,537,580 boxes, to which must be added about 1,200,000 boxes manufactured at home, making about 5,700,000 boxes entered for consumption during a period of unusual trade depression. As very small stocks were held at the close of the year, we should place a good year's consumption at nearer 7,000,000 than 6,000,000 boxes. Calculating on this basis, the overproduction claimed by our correspondent would be eliminated, and a sufficiency of trade would be left for all the American manufacturers, provided—and here comes the real difficulty—they are at the time producing the material called for by American consumers in proper quantities and proportions.

While we do not believe that the American tin plate works will be turning out a surplus of high grade bright charcoal plates, or even of ordinary coke tins by the close of this year, there does, however, seem to be some danger of their overdoing the roofing plate business. According to the latest published returns, the terne plate output of the United States comprised nearly 45 per cent. of the whole, a proportion which, if continuously maintained, would shortly entail a large surplus production of this class of plates. But the good sense and sound judgment of the American manufacturers may be relied on to avoid any such unwise proceeding.

A Modern Tin Plate Plant.

Many misleading and unauthorized statements have recently been made concerning the nature of the improvements and additions to the plant of the New Castle Steel & Tin Plate Company, New Castle, Pa., which have been under consideration for some time. Through the courtesy of George Greer, president, and Charles Greer, secretary, of the company, we were favored during a personal call with full information regarding the additions to be made at this plant, and also regarding some improved methods to be put in use in the manufacture of tin plate. At the start we wish to state that this concern will not build a stamping works, nor is it contemplated to remove a stamping works from another locality to New Castle, as has been stated.

The present plant consists of six mills, the output being from 35 to 40 tons of black plates per day. The firm have decided to erect 10 or 12 additional mills, making 16 or 18 in all, and when these have been completed, the output of the plant will be from 100 to 125 tons of black plates per day. The addition of these mills will give the New Castle Steel & Tin Plate Company the distinction of having the largest single plant of its kind in the world.

Provision has also been made for the erection of eight additional mills when they are needed. The contract for the new mills has been placed with the A. Garrison Foundry Company of Pittsburgh, Pa., and consists of hot mills, complete tandem cold roll mills, doubling shears, spindles, boxes, crabs, &c. The contract for the engines has been placed with the Bass Foundry & Machine Works, Fort Wayne, Ind., which concern furnished the engines for the present plant. The contract calls for two Corliss cross compound condensing engines of 1100 horse-power each for driving the hot mills, and one Corliss compound condensing engine of 700 horse-power for driving the cold mills. The same concern will furnish 175 tons or more of grooved pulleys for driving the mills by rope power. Power from the engines to the rolls will be transmitted by 2-inch special ropes. The diameter of the largest grooved wheel will be 25 feet, and this wheel will take power from a similar wheel from the engine shaft 14 feet 7 inches in diameter. These wheels are all grooved for 28 2-inch ropes made for this purpose. The contract for the new buildings, of which there will be two, has been placed with the Shiffler Bridge Company, Pittsburgh, Pa. These buildings will be 360 x 110 feet and 360 x 105 feet in size, and will be of steel. Ample light has been provided for and a new system of ventilation will be introduced. The buildings will be absolutely fire proof and will be constructed with a view of handling the raw and manufactured material to the most economical advantage.

In addition to the above improvements the New Castle Steel & Tin Plate Company have in view the more than doubling the capacity of their tinning department and the introduction of considerable labor saving machinery. The plan of driving the mills by rope power, thus doing away with gearing and housing, has been indorsed by some of the leading engineers of the country and pronounced entirely practicable. Incidentally it may be mentioned that this system has been in successful operation for some time in the plant of the New Castle Wire Nail Company, and is now being introduced on a more extensive scale in the rod mill of the same concern. An electric light plant of 100 arc lights of 2000 candlepower each of the very latest design and improvements will be installed. From the same dynamos incandescent lights will be furnished for the office.

Electric cranes, especially designed for this plant, will be used in the hot mill and cold roll mill buildings, and also in the annealing departments. In the construction of these improvements and additions the expenditure of money has been a secondary consideration, the whole object being to have a tin plate plant that will represent the most modern ideas of construction and improvements. It is expected that when the additions to equipment have been completed and the new methods introduced, the plant of the New Castle Steel & Tin Plate Company will be the best equipped tin plate plant in the world, and will, it is said, mark a new era in the manufacture of tin plates.

CABLE ADVICES from England report the stoppage, owing to financial difficulties, of the large Dyffryn Tin Plate Works of Daniel Edwards & Co. at Morriston, South Wales. The liabilities are estimated to be very large, probably between $300,000 and $400,000. The failure of other tin plate concerns is expected to follow. A meeting of employers and employed was held this week at Swansea and a committee was appointed to formulate a scheme to further reduce the make and raise prices to a basis of 11 shillings. Only 16 manufacturers were, however, present at the meeting.

The Welsh Tin Plate Crisis.

Not for 30 years has the Welsh tin plate trade been in such a critical condition as it is in at the present time. Probably never before in its history has the outlook for future improvement been so gloomy. During the disastrous period of depression which followed the close of the war in the United States the entire trade was reduced to the verge of bankruptcy and the workmen and their families were literally starving. But at that time they had always the good hope before them that the American trade, which was their mainstay, would revive again and that they would ultimately be enabled not only to recover their losses, but to extend the market for their product on this side of the water. While things are not yet as bad with the Welshmen as they were in the middle of the '60's, the existing emergency compares to disadvantage with the former crisis in that little hope can be held out to them of retrieving their present losses in the American trade. Still less can they hope to increase their trade on this side of the water. To this fact the Welshmen appear to have been phenomenally blind until within a comparatively recent period.

The rise and progress of the tin plate manufacturing industry in the United States seems to have been blinked, whether willfully or not, on the other side of the Atlantic, until its existence could no longer be ignored. Only three months ago, one of the leading authorities in the Welsh tin plate trade publicly announced that the competition of the American works was no factor in the depression of the trade in Wales, and that the industry in this country was really on a very small scale. And yet, at that time, works having a capacity of at least 1,500,000 boxes were in existence, and were ready to start into full operation at the moment that the wage scale difficulty was settled. This they have since done; and the most sanguine friends of Welsh interests are reluctantly forced to admit, as does the London *Engineer*, in an article recently reprinted in these columns, that "the manufacture of tin plate in the United States is in a fair way to become a great industry."

In this, the day of their adversity, when it has become generally recognized that the United States has begun in reality to make her own tin plates, the Welsh manufacturers and their workmen are finding many candid friends among the English newspapers and trade journals. The general drift of their remarks is the familiar and exasperating "we told you so." On every hand the burden of the censors of the British press is that both employers and employed have been blind to their own best interests and are now reaping the fruit of their folly. They have now discovered, with wonderful unanimity, that the manufacturers should long ago have adopted more progressive and economical methods of manufacture; and that wages should have been "regulated" sooner, while such arbitrary restrictions on production as the famous "36-box rule" should have been discountenanced and done away with. The workmen, they say, should have been more ready to co-operate with their employers for the general good of both instead of resisting imperative wage reductions and insisting on the enforcement of ruinous restrictions on the output. "The employers," says the London *Ironmonger*, "are deplorably lacking in enterprise and the workmen in respect of adaptation to current competitive conditions." The only way of escape from ruin that the *Ironmonger* can see is that the tin plate trade should be taken hold of by the large iron concerns and run on a perfectly modern basis in all respects.

In conclusion we quote the authority just mentioned, which appears to have reached the most practicable and rational solution we have yet seen of the Welsh tin plate difficulty: "With straightforward financing, modern plant and processes, enterprise and 'go' there is no reason why the trade should not remain an important one in spite of any amount of American competition. There is ample room for expansion. For instance, tin plates ought to be and might be used for packing tea in India, Ceylon, China, Japan and other countries, and if the planters were properly approached, they would probably adopt the idea. But the Welsh makers do not approach them and do not seem capable of any effort to save the one trade which up to quite recently was one of our few remaining monopolies."

A New Process of Pickling Metal.

The pickling department is one of the most disagreeable features of wire drawing or tin plating establishments. For some years chemists and electricians have been attempting by the use of electricity to devise a method by which the use of acid could be largely or wholly avoided in cleaning metals. The substitution of electricity was found to be extremely difficult, owing to the resistance in the solutions to the current and the unevenness of action on the substances to be pickled. All efforts in this direction proved abortive until quite recently. It is now stated that the process of cleaning metals by electricity has been fully demonstrated in the West to be a complete success. A Scotch chemist, Dr. A. H. Ramage of Edinburgh, who has devoted years to the study of this question, has lately succeeded in demonstrating on a large scale in one of the leading wire mills of the country that he has overcome all the technical difficulties and reduced the process to practical results. Those who are familiar with what has been accomplished by him are confident that he has perfected a new process of pickling which will supplant the old method.

The process consists in making the articles to be pickled the anode or positive pole during the electrolysis of a solution of a salt of iron. In the case of pickling rods for wire drawing the rods were immersed in a solution contained in a vat made of wood and having round its sides in the solution a thin cylindrical sheet of iron, and connected by the hooks holding the rods to the positive pole of a plating dynamo capable of giving in the case of white pickling a current with a pressure of 1½ to 2 volts, and in the case of black pickling a pressure of 4½ to 5 volts between anode and cathode, while the thin circular sheet of iron was attached to the negative pole. The current passing through the solution liberates the acid of the salt on the anode or article to be pickled and the iron on the negative,

consequently liberating the acid on the rods. This, combined with the surface scale and iron, forming the original salt again, which is dissolved in the solu tion, while the amount of iron dissolved off the rods was deposited on the negative cylindrical plate.

A small dynamo of 8 horse-power served a ton of rods per hour consecutively, cleaning them so thoroughly that they drew down from No. 5 to No. 15 gauge perfectly. The wire was then galvanized, and that operation was also quite successful.

In black pickling the current used is of greater voltage than in white, be cause the scale covering the rods or plates being a poor conductor it caused a greater resistance to the current. As the scale dissolves, the current passes through with diminished voltage.

The process hss also been practically tried with plate for tinning, and are rangements are now being made to place it in some of the largest tin platworks in the country. The plates were pickled ½ ton at a time, and perfectly done, and then tinned.

The process is owned by the International Metal Pickling Company, 1113 Chamber of Commerce Building, Chicago, who have placed it in a wire mill near that city.

Those who have had experience of the steam and acid fumes ever present in conducting the old process will thoroughly understand the relief to workmen which cleaning by electricity will give, while its saving of nearly all the acid used by present methods is of the greatest practical account. The saving in acid in one mill alone amounts to $1800 per week, which shows enormous possibilities in economy. From a sanitary point of view, great advantages are also claimed, as the new process does away with the insidious health destroying fumes and with waste liquors running down drains to pollute rivers and lakes. The pollution of water courses is now becoming an important matter in this country. Looking at the question from all sides, the successful application of electricity to the pickling of metals may be considered one of the great improvements of this decade.

SCRAP.

PRESIDENT M. M. GARLAND of the Amalgamated Association of Iron and Steel Workers was the guest of the American Tin Platers' Union, at Elwood, Ind., this week. He expressed the opinion that the outlook was much brighter for the tin plate business, and he looked for a revival of business in this line during the summer months.

ACCORDING to English advices, more disquieting rumors are being circulated as to the financial position of tin plate works in South Wales. It is stated that at least two large and old established concerns have actually suspended payment, and that others are likely to follow suit.

A PRESS CABLE DISPATCH of February 28 from Swansea, Wales, states that at a meeting of the South Wales Tin Plate Board of Control, held that day, it was decided, in view of the depression in the tin plate trade, to only run 397 mills, and that these establishments were to run only on two-thirds time. It was also resolved to restrict the production to one-third of the present output. Eighty-five mills which have not joined the Board of Control will work independently.

THE LEECHBURG FOUNDRY & MACHINE COMPANY, Pittsburgh, have made their first shipment on the contract for tin plate machinery to the La Belle Iron Works, Wheeling, W. Va.

F. R. PHILLIPS, Philadelphia, is erecting and equipping the entire tin plate plant for McIlvain, Crater & Hugh, at Reading, Pa. Two Phillips-Newbold machines have been shipped to the works and a third will follow as soon as ready. Mr. Phillips advises us that he has recently shipped three of his latest improved eight-roll machines to the Falcon Tin Plate & Sheet Company, Niles, Ohio, and two to Richmond, Va. Three more are building for the South and nine for the West.

A NEW FEATURE in the British Board of Trade returns of imports and exports for the month of January last is a separate table showing the exports of black plates of steel and iron for tinning. Prior to 1895, iron black plates were included with "hoops, sheets, and boiler and armor plates," while steel black plates were enumerated under the heading of "steel unwrought;" consequently it was very difficult to obtain any reliable statistics as to the amount of black plates for tinning purposes shipped to the United States from Great Britain. The amount so exported in January, 1895, was 24,153 tons. To all other countries 15,808 tons were shipped, making total exports 39,961 tons.

POLLOCK & Co., Limited, is the style of a firm located at 2040 North Tenth street, Philadelphia, who have commenced tinning plates. They have one pot running on roofing plates and expect to have others in operation shortly. The concern originally were manufacturers of solder, and they propose to continue that branch in connection with their new venture.

WE UNDERSTAND that a new tin plate works will shortly be put in operation in Baltimore, Md. A suitable location in the section of the city known as Canton has been secured and contracts have already been let for the machinery equipment. It is reported that the contracts include machinery for rolling black plates.

MERCHANT & Co., Incorporated, Philadelphia, are now running six pots at their tin plate works.

THE QUESTION of the actual capacity, present and prospective, of the American tin plate works is a particularly interesting one, in view of the prediction freely expressed that their product will before long outrun consumption. John Jarrett of Pittsburgh, secretary of the Tinned Plate Manufacturers' Association, who has excellent facilities for gathering information on this head, figures out that at the present time there are in operation in this country, and in actual course of construction, 157 hot mills. There are contemplated, and will likely be erected within the next six months, 39 additional mills, or a total of 196 hot mills that are expected to be in operation by October 1 next, or earlier. Allowing a product of 2 tons to the turn, or 6 tons per day for each of these mills, which is a low estimate, gives a total daily output of 1176 tons. Computing 270 working days to the year gives an annual output of 317,520 tons of 2240 pounds each of black plates. In a box of IC plates, 14 x 20, there are 112 pounds. Simply multiplying the total output by 20, the result gives a potential production by American tin plate works of 6,350,400 boxes per annum.

SERVICEABLE DESK BLOTTING PAPERS are being distributed by Nathan Trotter & Co., Philadelphia, Pa., in the interests of their special plates. One blotter, backed with smooth paper, refers to Trotter's roofing, which is described as a high grade American roofing plate, extra heavy coated and every sheet guaranteed to be equally and evenly coated, the sheets furthermore being resquared and stamped with brand and thickness. An important feature of this plate is that there are no wasters. The firm have had a long experience in supplying the wants of the American people in the line of tin plates and metals, having been established in the year 1789 and are therefore in their 106th year.

THE TIN PLATE DECORATING COMPANY, 110 John street, New York, an old-established concern making a specialty of color work and other decoration for tin ware, speak in high terms of the smooth and even quality of the coating on the high grade bright tin plates made in this country. They refer to the American product as lending itself peculiarly well to their work, for the finer kinds of which a particularly smooth surface is indispensable.

THE HENDERSON TIN PLATE COMPANY, Norristown, Pa., have their works still closed down, and there seems to be no probability of their being put in operation in the near future.

THE WORKS of the Norristown Tin Plate Company at Earnest Station, near Norristown, Pa., are closed down indefinitely and Richard Lewis, their late manager, under whose superintendence the works were erected and successfully run for over two years, has returned to Wales. We are informed by Charles S. Trench & Co., 20 Cliff street, New York, the agents of the Norristown Tin Plate Company, that the works are now for sale. They include eight tinning sets, a steam pickler, electrical plant and other recommendations.

THE Falcon Iron & Nail Company and the Falcon Tinplate & Sheet Company of Niles, Ohio, have opened an office and warehouse in Chicago for the sale of Galvanized and Black Sheet Iron, Cold Rolled and Common Surface Sheet Steel and Tin and Terne Plate. A full stock will be carried at all times, so that prompt shipments can be guaranteed. The office and warehouse are at the well-known stand at 16 and 18 West Lake street and will be under the management of Wm. E. Stockton, who was for many years the Western representative of Moorhead, McCleane Company. The Falcon companies have for some time been contemplating the establishment of a warehouse in Chicago, and are fortunate in securing such a well and favorably known representative of the Sheet trade as Mr. Stockton to manage it. E. C. Brainard, general salesman, will be more closely associated with the home office in the future.

TWO HUNDRED AND THIRTY Welsh tin plate mills, out of a total of 531, were entirely idle the first week of this month, and many more were running at a low rate of production. Since that time others have shut down, so that nearly half the tin plate capacity in Wales is now inactive.

THE eight mills of the Dyffryn Tin Plate Works, Morriston, South Wales, are idle.

STOVE TRADE NOTES.

Daniel M. Thomas.

The death of Secretary D. M. Thomas, which was briefly announced in these columns last week, removes from a broad field of usefulness a man of sterling worth and one whose loss to the stove trade of the country will be severely felt, especially by the two associations with which he was prominently identified during the later years of his life. Although the trade at large was kept advised from time to time of the serious illness of Mr. Thomas, and finally of the faint hopes entertained of his ultimate recovery, the announcement contained in our last issue must have come as a sudden shock to the multitude of those who enjoyed a personal acquaintance with him, while many others who knew him only by his name and works will deeply regret the loss to the business world. For nearly a year past Mr. Thomas was far from a well man, but it was not until his return from a meeting of the stove men in the West, early in December last, that his condition became such as to alarm his friends. For a time he was confined to his home, but during the holiday week felt so much better that he visited his office at 80 Broadway, New York. The improvement in his condition, however, was of short duration, and with occasional rallies he gradually grew weaker until at a quarter before 12 on the morning of Thursday, February 21, he quietly passed away.

DANIEL M. THOMAS.

Mr. Thomas was born on May 11, 1840, at Swansea, South Wales, where he received his early training and education. At the age of 14 years he became connected with the tin plate industry, remaining in Swansea until the year 1867, when he came to America. His first business connection in this country was in the capacity of bookkeeper for the house of Foxell, Woodworth & Jones, hollow ware manufacturers, Troy, N. Y. In February, 1868, in connection with the late Louis Potter of the then stove manufacturing firm of Potter & Paris, he formed what was known as the Troy Galvanizing Company. In November, 1868, Mr. Potter disposed of his interest to the firms of Hicks & Wolfe and Sheldon & Greene, at that time prominent stove makers of Troy, but the business was continued until galvanized reservoirs ceased to be largely employed for stoves. In 1871 Hicks & Wolfe leased the foundry of Morrison & Colwell, at Green Island, and Mr. Thomas assisted in the management, which may be said to have been his introduction to the stove business of this country. In the year 1874, the galvanizing trade having been rendered unprofitable by the introduction of tin lined copper reservoirs for stoves, Mr. Thomas, in connection with two others, erected in 1875 a foundry at Medina, Ohio, for the manufacture of hollow ware. Owing, however, to a lack of sufficient capital, the enterprise was not altogether successful, and Mr. Thomas turned his attention to other things. Later in the year named he was invited by the late W. H. Tefft, president of the Detroit Stove Works, Detroit, Mich., and the late John J. Bagley, Governor of the State of Michigan, to make his home in Detroit. This he did, and in connection with Mr. Tefft, Gov. Bagley, Francis Palms, E. S. Barbour, M. I. Mills and Jeremiah and James Dwyer, he formed what was known as the Detroit Iron & Brass Mfg. Company, incorporating it under the laws of the State of Michigan, the principal product of the company being stove hollow ware. As secretary, he continued in the management of this corporation until the year 1887, when the charter was surrendered. The business was carried on in Detroit until 1881, when it was removed to Elmira, N. Y., and continued under the name of the Chemung Hollow Ware Works.

It was, however, in his relations to the National Association of Stove Manufacturers and the Stove Founders' National Defense Association that Mr. Thomas was best known to the stove trade of the country. It was at the Louisville meeting of the stove manufacturers, held February 3 and 4, 1886, that a resolution was adopted authorizing the employment of a permanent secretary. Mr. Thomas received the appointment and entered upon the discharge of his duties July 27, with headquarters in Louisville. The Defense Association was formed at Cleveland, Ohio, on June 4, 1886, at which time Mr. Thomas was elected secretary of that organization. These positions he retained until February 1, 1890, when he retired and shortly afterward took general charge and direction of the affairs of the Keeley Stove Company of Columbia, Pa. At the Chicago convention of the National Association of Stove Manufacturers held the first week in February of that year Mr. Thomas was elected president, which office he held until the Philadelphia meeting the first week in May, 1891. At this time he was again selected for the office of permanent secretary of the two associations, retaining it until the time of his death. Mr. Thomas was in many ways peculiarly well qualified for these important offices, being a man of strong character, wide experience, not easily discouraged by difficulties however serious, and of excellent executive ability. At the time of his death he was a member of the American Institute of Mining Engineers and president of the Bower-Barff Rustless Iron Company, he being elected a director of the company on October 2, 1891, and president on August 31, 1892. He leaves a widow, three daughters and a son.

The funeral services were held at his late residence, 134 Fort Greene place, Brooklyn, N. Y., at two o'clock on the afternoon of Monday, February 25. The impressive burial service of the Episcopal Church was read by Rev. Dr. Lindsay Parker of St. Peter's Church, assisted by a boy choir, which rendered, among other pieces, "Abide With Me," "Rock of Ages" and "I Heard a Voice from Heaven." The floral tributes were numerous and beautiful, conspicuous among them being a large wreath of lilies of the valley, with the letters "N. A. S. M." in dark flowers across the center; a handsome cross from the New York members of the National Association of Stove Manufacturers, and a beautiful wreath from the New England Stove Manufacturers' Association.

Among the friends who gathered at the house were representatives of the stove associations with which Mr. Thomas was connected, and also members of the local trade. Prominent among those present were George D. Dana of St. Louis, Mo., president, and W. S. Stevenson of Philadelphia, Pa., treasurer of the National Association of Stove Manufacturers; W. T. Bradberry of the Anshutz-Bradberry Company, Pittsburgh, Pa; E. W. Peck of the Co-operative Foundry Company, Rochester, N. Y.; Abram C. Mott of the Abram Cox Stove Company, Philadelphia, Pa.; W. F. Greene of Troy, N. Y.; C. L. Merritt, formerly of Jones & Merritt, hollow ware manufacturers of Auburn, N. Y.; Prof. George W. Maynard of the Bower-Barff Rustless Iron Company; Eugene Munsell of Eugene Munsell & Co., D. S. Ramsay of Ely & Ramsay, Fred. and Dwight Richardson of Richardson & Boynton Company, Henry E. Janes of Janes & Kirkland, agents for the Michigan Stove Company, and William Corry, all of New York City.

The Stove Trade of the Ohio Valley.

Reports respecting the stove and range industry within a radius of 200 miles of Cincinnati are still somewhat conflicting, but the impression is given of an improvement in the volume of business, certainly in the growth of confidence. Especially is this the case in Ohio and Indiana. There are exceptions, of course, even in Ohio, but south of the Ohio River the opening of better times seems to be delayed beyond the experience of those in more fortunate situations.

Some manufacturers in Ohio are very emphatic in their statements of marked improvement in trade since the opening of the new year, citing a volume of business in January more than double that of January, 1894, while thus far February has kept pace with the preceding month's record. On the other hand there are foundries south of Mason and Dixon's line where sales have averaged about 10 per cent. less thus far during the current year than during the corresponding period of 1894, and in consequence some manufacturers are still running only half time, without encouraging prospect for the early future. Money continues scarce and collections poor.

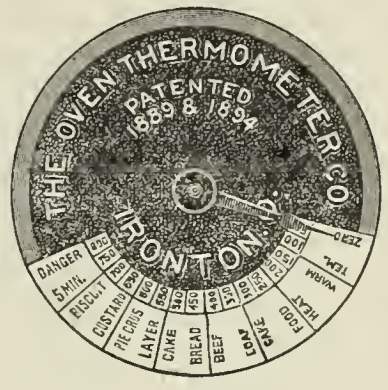
Of course the value of any comparison with last year depends largely upon the actual business done a year ago, and all improvement or depression is of a relative nature. Happily the experience of the Southern foundries seems to be the exception rather than the rule. The stove cupolas north of the Ohio are melting more and more iron as the season advances, as is evident from purchases of pig iron, reports of contracts and by direct information of a number of manufacturers, who are resuming operations or increasing half to full time. The money market at Cincinnati has hardened materially during the week, with increased application for discount from merchants and manufacturers and liberal shipments of currency to the rural districts.

Philadelphia Stove Trade.

The stove trade in this section is dull and inactive. It was naturally expected that the recent cold snap would stimulate the trade sufficiently to help off the stock of heating goods remaining in the dealers' hands. Such was not the case, however, except as regards gas and oil heaters, which goods found ready sale and were practically cleared out. The demand for coal stoves throughout the month of February was exceedingly light. Of course after the end of January the season for heating goods is considered closed, but it was surprising that the continued severe weather did not prolong the season. There is a little doing in ranges, but it cannot be said that business in this line is up to the average. The demand for furnaces keeps up wonderfully well, especially in the higher grades.

Refrigerators and gas and oil cooking goods are making their appearance on the market, and the outlook for a better trade than was experienced last year in this line is very encouraging. Most of the goods show improvement upon last season's styles, and the variety is somewhat increased.

It is pleasing to notice a decided improvement in collections. Fully two-thirds of the obligations maturing last month were met in full. Requests for renewals of paper were for the most part accompanied by cash remittances, and the plea of "hard times" was urged by chronic laggards in a lesser degree than for some time past.



Stocktaking has occupied the attention of founders more or less since the opening of the year, and the running of foundries consequently has not been steady, even with a decreased output. There is a comfortable feeling existing in regard to the future, and the usual preparations in the way of new goods for the coming season are evident. It is pretty generally conceded that the demand next fall will be large, but conservatism in regard to outputs will be studied, and therefore it is not at all likely that there will be heavier stocks warehoused than was the case last year, reliance being placed upon a full running of plants to supply the demand.

The Secretaryship of the National Association of Stove Manufacturers.

We are in receipt of official advices that the office of secretary of the National Association of Stove Manufacturers will, for the present at least, be continued at 80 Broadway, New York City, as heretofore. Miss M. A. Thomas has been appointed to serve as secretary until the next annual meeting of the association in May. All correspondence pertaining to association matters should therefore be addressed as above.

Oven Thermometer.

In speaking of the oven thermometer shown in the accompanying illustration the Oven Thermometer Company of Ironton, Ohio, say that it is just the proper thing for bake ovens of all descriptions and that it has been in use by a number of professional and amateur cooks with great satisfaction. The hand on the dial is operated by mechanism which is moved by the expansion of a straight piece of brass which is fastened securely at both ends. A very little expansion causes a considerable curve and the movement is transmitted by means of a cogged rack to a small pinion on the shaft which passes through the tube to the dial. In adjusting it to an oven door it is only necessary to drill a ¼ inch hole to allow the small tube to pass through. The casting to which the brass rod is attached is then fastened to

Oven Thermometer.

the oven door by means of a jam nut to which the dial is attached. All the iron parts are nickel plated and the dial is enameled in the same manner as watch dials. The parts being interchangeable, any part that may be broken can be replaced in a few minutes. The company issue circulars, which will be furnished on application, showing the dials used in connection with coal and wood stoves and with gas ranges. They are said to be very simple and easily adjusted.

New York East Side Chat.

The late John S. Perry paid a great deal of attention to statistics, and among his addresses to the stove trade was one touching immigration. The prospective immigrants were counted as large consumers of stoves, and so they are, for stoves formed a part of every family outfit, and a diminution of immigration meant a lesser demand for stoves. But in addition to its consumption of stoves immigration has brought a large number who have become dealers in them, and it is astonishing how successful are many of them. New York numbers lots of these people, who couldn't speak a work of English, who have started in the business and are in good circumstances—in fact are wealthy, according to their way of living. As soon as the Americans make money they begin to spend it, and plenty spend more than they make. The family want to get away from the shop and have a house to themselves, and it takes considerable money to run them without regarding accumulation. Not so with the for-

eigners. They save and pinch and live in the same surroundings that would hardly suit even the poorest Americans. As the greenhorns arrived in New York they were in demand, and as they could not speak United States, would work for their board. Excellent help and mechanics were easily procured by the East Side dealers for nominal wages and they made them earn it. Nights, days and Sundays they put them through; they would send men downtown and make them bring up a load of stuff big enough for an express wagon, carry stoves on their backs or in hand carts—in short, it was an ever lasting work for the greenhorn.

They usually put in an appearance through Water street in company with one of the boss's progeny, perhaps a little girl eight or nine years old. It is surprising how young these children begin to learn business. She has the orders written out, and as the pieces are bundled up she pays for them and the man carries them home. Some of these tots interpret very fast and seldom make mistakes. The parents of many of them never learn English and cannot make themselves understood, although they may have been here for years. They depend entirely upon their children, consequently the youngsters early acquire business habits and are unusually precocious. The daily contact with the teeming East Side populace whose only refuge is the streets is a prominent factor in their development. They are always sent to school, and it is somewhat surprising the metamorphosis that is made in them in a few years, especially the girls. They begin to spruce up very early, and as they generally come from a healthy stock they round up in great shape, and the dirty little snip soon becomes a natty young woman. But, of course, she will have the East Side polish, which is not exactly of the 400 style, but it is a sort of a sure Mike kind and no humbug, and when she slings on her duds Sundays and holidays and goes down to Coney Island or wherever she pleases, she don't say nothing to nobody and nobody desires to say anything to her unless she wills it. There is no theory about her education; it is practical and what she knows she knows. People who are brought up in the tenement house districts acquire what may be termed a tenement house twang to their voice and it seldom leaves them. Many of these people get uptown and live in great style—that is, as far as spending money and having fine houses are concerned—and they really do enjoy being sociable and having good times, and as a rule they don't neglect their downtown neighbors. Many of the East Side tenements turn out a big crowd who visit up in the high priced circles of the city and they all have a good time. But if you once get on to that twang you will never mistake the origin of many of New York's finely draped people. They certainly are stylish looking, and if you did not know their voices you would think they were McAllister's intimates.

You can rely upon it that Heinne Schnitz, whose portrait adorned *The Metal Worker*, will get uptown before long. He has got some fine looking kids and they will boss him out. The men who have the hard times with these greenhorns when they begin to come downtown for repairs are the porters in the stove stores. They have a smattering of English, but it is as clear as mud to the porter as to what Heinne or his brother would want. As soon as they commence to ask Heinne about "the dates, or, if it is a draw grate, does it shake on the side ?" the trouble begins. Usually when people do not understand each other's language, they make amends by yelling about what they wish to say, and by doing this they are evidently under the impression they make it perfectly clear what they do say.

But the Water street porter is not a saint at any time, and the crowd and rush in the fall transform him into a demon. There are always a lot of people after repairs, and as they come in a rush, all wanting to be waited on at once, it is very trying; and when it comes Heinne's turn in one of these crowds to get his stuff, and he has to be questioned about it, you can rely upon it there is a row. But Heinne grows out of it in a year or two, and when "he makes pisness by himself," somebody looks after him besides the porter, and "How do you do, Mr. Schnitz ? How is all the family, Mr. Schnitz ? Come down to get some stoves to day, Mr. Schnitz ?" &c. One touch of business makes kindred of us all.

JEEMS.

ODD PLATES.

THE KERNAN FURNACE COMPANY, Utica, N. Y., will be represented upon the road during 1895 by the following salesmen, who will cover the territory named: William J. Owens, in Illinois and Wisconsin; George B. Carrwith, headquarters at Omaha, Neb., in Minnesota, Iowa, Nebraska, Missouri and Kansas; C. H. Fresher, Western Pennsylvania, Southern Ohio and Indiana; E. R. Rayburn, in Northern Ohio and Michigan; J. A. Breen, in New York and Vermont; John Hastings, in Central New York, and Harry King, in New York City, Brooklyn, Eastern Maryland and the District of Columbia. The company's Chicago branch will be in charge of Charles A. Sweeney and Edward F. Kernan and their Denver branch, which will handle the trade in Colorado, Wyoming, Utah and the Pacific Coast, will be under the management of Kellogg & Stokes.

THE Albany. N. Y., branch of the Stove Mounters' International Union has appointed a committee to visit the various foundries in that city and endeavor to arrange for carrying on the business under the auspices of the union.

JACOB WILSON, Easton, Pa., has augmented his popular line of New Idaho ranges by the addition of a size having an oven 20½ x 21 inches in area and 13 inches in hight.

THE WEST SIDE FOUNDRY COMPANY of Troy, N. Y., have just completed the list of their traveling men and the territories to be covered this year, as follows: D. L. Hamill, for Western New York; J. F. Hart, for Eastern, Northern and Southern New York; E. Geer, for Vermont and New Hampshire; O. C. Harrison, for Michigan, Wisconsin and Minnesota; E. B. Morse, for Indiana, Eastern and Southern Ohio. In Northern Ohio the company will be represented by the Stolberg & Clapp Company of Toledo, Ohio.

THE EXCELSIOR MFG. COMPANY, St. Louis, Mo., advise us that their agent at Austin, Texas, Geo. A. Brush, has sold one of their largest Charter Oak ranges to Mrs. Governor Culbertson of Texas. Mr. Brush in writing to the Excelsior Mfg. Company with reference to this sale admits that he feels very proud of having made it, as the cook in the Governor's house is a prize cook, and had a Charter Oak range in her mother's house for seventeen years, and thus feels that she knows the merits of the Charter Oak stoves.

THE LEHIGH STOVE & MFG. COMPANY of Lehighton, Pa., are distributing a neat four-page folder illustrating and describing the Lehigh range, which is offered the trade in four sizes and 32 varieties. This stove has been upon the market for nearly five years, and has established for itself an enviable reputation among dealers. The circular states that this stove "marks a distinct improvement in range construction, being made with what is known as a sheet flue, which, while increasing the draft and making a marvelously quick baker, at the same time avoids any contraction of the oven." It has patent triplex grate, oven door opener and attractive ornamentation, in which nickel plays an important part.

THE MODEL LEHIGH RANGE, which has recently been placed upon the market by the Lehigh Stove & Mfg. Company of Lehighton, Pa., is the subject of a very complimentary notice in a recent issue of the Lehighton *Press*. Reference is made to a practical test of this range in the kitchen of the residence of Mr. Butler, at East Mauch Chunk, Pa. On Saturday evening, February 16, Mr. Butler entertained E. L. Smith, the bookkeeper of the stove works; Isaac Oberholtzer, superintendent of the mounting department, and Jacob De Frehn, who has charge of the shipping department. The entire dinner was prepared on the Model Lehigh and was a success in every particular.

THE CLEVELAND STEEL RANGE COMPANY have just completed arrangements for the transfer to them of 66 feet of land at the northwest corner of Detroit and State streets, Cleveland, Ohio, where they propose erecting early in the spring a three-story factory which will accommodate about 300 men. We understand that by the terms of the transfer the company gain control of the entire lot, which extends back to Vermont street. The building will be of brick and equipped with machinery of the most approved pattern. At the present time a frame dwelling occupies the new site, but this will be moved to the west of the lot so as to make room for the new building.

THE WEIR STOVE COMPANY of Taunton, Mass., are making arrangements to enlarge their works in order to provide additional facilities for meeting the increasing demands of their trade. About two years ago they added a story to the office portion of their main building, and now they propose to raise the remainder of the structure another story, thus making both parts uniform. The work will be commenced as soon as the weather will permit and pushed rapidly to completion.

MICHAEL RAGAN of Cadott, Wis., died of Bright's disease on February 13, at the age of 32 years. He was manager of the Cadott Heating & Stove Company and secretary of the Northwestern Heating and Stove Association.

THE GEAUGA FOUNDRY & MFG. COMPANY, Painesville, Ohio, have a curiosity in the shape of a cook stove which is claimed to be the oldest of its kind in that State. It is said to have been cast in the year 1822, direct from a blast furnace, the material being charcoal iron made from bog ore.

THE SHULTZE STOVE MFG. COMPANY of Austin, Texas, were recently incorporated, with a capital stock of $20,-

000. The incorporators were Herman Shultze, Claude Wright and Gustavus A. Bohnert.

THE PHILLIPS & CLARK STOVE COMPANY of Geneva, N. Y., have resumed operations after being closed about two months.

JOHN H. SCHNEIDER, eldest son of Paul and Anna Schneider, died at Bedford, Ohio, on Friday, February 22, in the twenty-fourth year of his age. He was assistant superintendent of the Schneider & Trenkamp Company of Cleveland, Ohio.

THE RICHARDSON & BOYNTON COMPANY, 234 Water street, New York, are receiving congratulations on the behavior of the Perfect hot air furnaces during the recent cold weather.

THE TOLEDO STOVE COMPANY of Toledo, Ohio, whose foundry has been closed for a short time on account of damage from fire, advise us that the *débris* has been removed and that their molding department is now in complete running order.

THE SUPERIOR STEEL RANGE COMPANY of Cleveland, Ohio, have recently removed their offices to the large building 131–135 Viaduct, where they enjoy increased facilities for handling their large and growing business. The demand for Superior and Marquart steel ranges is of a gratifying character, and with their new accommodations they are prepared to promptly handle all orders with which they may be intrusted.

THE LEHIGH STOVE & MFG. COMPANY of Lehighton, Pa., are distributing an illustrated circular calling the attention of the trade to their Model Lehigh range, fitted with patent oven thermometers. The latter device is so placed as to show at a glance at the outside of the oven door the degree of heat within the oven. The device tells when the oven has reached the proper temperature, and avoids the time and trouble of constantly opening the oven door to see if the heat is great enough. It also tells how to manage the fire by showing when the oven is nearly at the right heat, at which time, with a good fire, the front drafts can be closed. This not only saves putting on fresh fuel while baking is in progress, but also saves in the amount of fuel used. The Model Lehigh embodies all the improvements of the famous Lehigh series, and has ample flues, cut top, large oven, patent duplex grate and attractive ornamentation.

THE EMERGENCY TRADE resulting from the cold weather has made business brisk for Sam S. Utter of 113 Beekman street, New York, oil and gas heaters alike being in demand. Arrangements are being made for a lively summer trade and his line of oil and gas cooking stoves for this year will be of the up-to-date character.

THE FRONT RANK STEEL FURNACE COMPANY, 705–707 North Main street, St. Louis, Mo., are distributing to their friends in the trade cards measuring 3½ x 6 inches, calling attention to the fact that they are heating contractors and in a position to furnish and install both warm air and hot water apparatus.

THE BRAND STOVE COMPANY of Milwaukee, Wis., are about to open a branch warehouse and salesroom at 77 Lake street, Chicago, on the ground floor, under the management of De Witt Van Evera, as heretofore. They will carry a stock of stoves and a full line of castings. They will be fully equipped and in better shape than ever to do business in Chicago and suburbs, having what they consider one of the best locations in the city for handling goods. They expect to be ready by March 11 to make deliveries of both stoves and castings from the Chicago house.

THE PORTSMOUTH STOVE & RANGE COMPANY, with general office and works at Portsmouth, Ohio, have just issued a little pamphlet of a size convenient to carry in the pocket, illustrating and describing their model steel ranges. These are shown in different varieties, accompanied by full descriptive particulars. Attention is also given to steam tables, charcoal broilers, &c., while price-lists and numerous testimonials constitute other features of the little volume.

THE K D STEEL RANGE COMPANY have recently been incorporated at Cleveland, Ohio, with a capital stock of $10,000, for the purpose of buying, selling and manufacturing steel ranges and novelties. The new concern are erecting a factory for manufacturing purposes and expect to have the plant in operation in about six weeks. The incorporators are Frank Lewis Warke, Oscar T. Emrich, Frank C. Cain, Irving E. Hershy and Frank E. Dellenbaugh.

MAY & FIEBEGER, Akron, Ohio, are offering the trade what is known as the Akron air blast furnace, so constructed, it is claimed, as to successfully burn all kinds of fuel, but more especially soft coal. This heater is the invention of Mr. May, who after 25 years' experience in the furnace business became convinced by careful experimentation and study that radical improvements could be made in furnaces as then constructed. He therefore invented and about six years ago perfected the "air blast" principle for burning coal, which he has applied to the Akron air blast furnace. This heater has been before the trade sufficiently long to establish for itself an enviable reputation, and during the extreme cold weather of the past winter has been severely tested with entirely satisfactory results.

JAMES P. GARDNER has an article in a late issue of the Cincinnati *Commercial Gazette* in which many facts and figures of interest in connection with the American export trade are presented. He shows that from June 30, 1892, to June 30, 1893, there were exported stoves and ranges valued at $216 463, and for the fiscal year ending June 30, 1894, the valuation was $236,284, showing an increase of $19,821.

THE FAVORITE STOVE & RANGE COMPANY of Piqua, Ohio, received under recent date a very complimentary letter relative to a gas range which they have lately put upon the market, the writer being the general superintendent and engineer of the Mutual Fuel Gas Company of Chicago, Ill. We quote from the letter the following extracts: "The burners work perfectly under a range of pressure of from 1 to 4 inches, and I have been unable to make them explode either while lighting or turning off the gas. The pilot for lighting the oven burners is both ingenious and effective, and without doubt, the best I ever saw. The oven is a gem, being amply large for any family, and perfection itself in its operation."

GRINBERG BROTHERS of 154–155 South street, near Peck slip, New York City, are pushing with a great deal of enterprise the sale of their specialties in the way of gas and oil stoves. They are offering the trade, among others, the Eagle two burner hot plate for gas and a two-burner lamp stove made under the same name.

THE B. C. BIBB STOVE COMPANY, Baltimore, Md., are about to place on the market the Harford, a portable range in two sizes, for use either with or without a fire place. It has a horizontal boiler, right or left oven, ash pit of ample size, patented device for heating an upper room, and all modern improvements. The range will also be supplied to suit an ordinary side boiler, and fitted with brackets and plate shelf. The company are also redressing their Washington fire place heater, and the same, in its improved style, will be known as Washington No. 2. The company's works are at present closed for stock taking.

WE HAVE RECEIVED from the Michigan Stove Company a package of circulars and pamphlets calling attention to a number of their leading specialties. One of these publications which is printed in colors relates to the Oak-Garland line of stoves for hard or soft coal or wood. A four-page folder illustrates and describes the Syphon Oak-Garland, an attractive base heater embodying the latest features. This circular is also printed in colors and presents a general view of the stove as well as a view showing the bottom of the stove removed and the base flues exposed. A circular which we find in the package carries a picture of an outside swinging sign consisting of the Garland trade-mark. The sign represents the results of efforts which have been made ever since the company's trade-mark was originated, with a view to producing something that would exactly meet the requirements. The sign is made of stamped metal and measures 36 x 44½ inches. The purpose of the sign is to hang in front of the dealer's store, where it cannot fail to attract attention. These signs are offered at the low price of $11 each and the company agree to take back the sign at any time and to refund the money. We also have from the company a card, intended for transmission through the mails, and carrying upon one side reference to the use of aluminum in Garland stoves and ranges and to the fact that they are provided with aërated ovens.

FLASHINGS.

THE JOHN MCVOY CORRUGATED IRON WORKS, Muncie, Ind., are reported as running steadily, and shipping out three carloads of iron a week.

J. J. LINSKY, Union City, Conn., is remodeling his building, which will have sheet metal cornice and skylights.

THE JERSEY CITY GALVANIZING COMPANY, 112 John street, New York, have just issued a new and enlarged catalogue and price-list of their specialties in metal roofing, corrugated and round leader, ventilators, and sheet iron work of a large variety. The company are running their works in Jersey City, N. J., full and speak encouragingly of the outlook in business.

GLOBE VENTILATOR COMPANY, Troy, N. Y., send out cards calling attention to the merits of their well-known device. A white line sketch of a ventilator ousting a company of disease germs, together with an appropriate description in verse, is a feature of the card.

Star Wrenches.

The cuts shown herewith represent wrenches offered by the Star Wrench Company, 801 Wainwright Building, St. Louis, Mo. The pipe wrench, Fig. 1, is made without springs and is interchangeable in all of its parts. The movable jaw and the nut are made with an oval top and bottom thread, guaranteed by the makers not to slip or burr. The manufacturers claim that the wrench grips the pipe firmly without any lost motion, and that it will not mash the pipe nor slip off. The wrench is made in eight sizes,

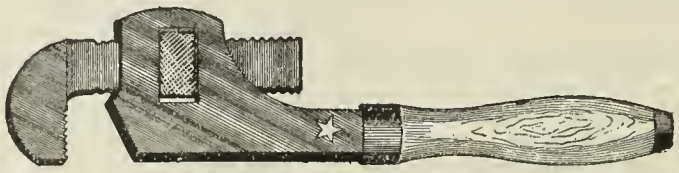


Fig 1.—The Star Pipe Wrench.

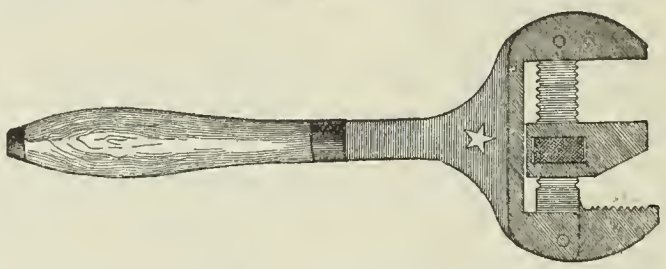

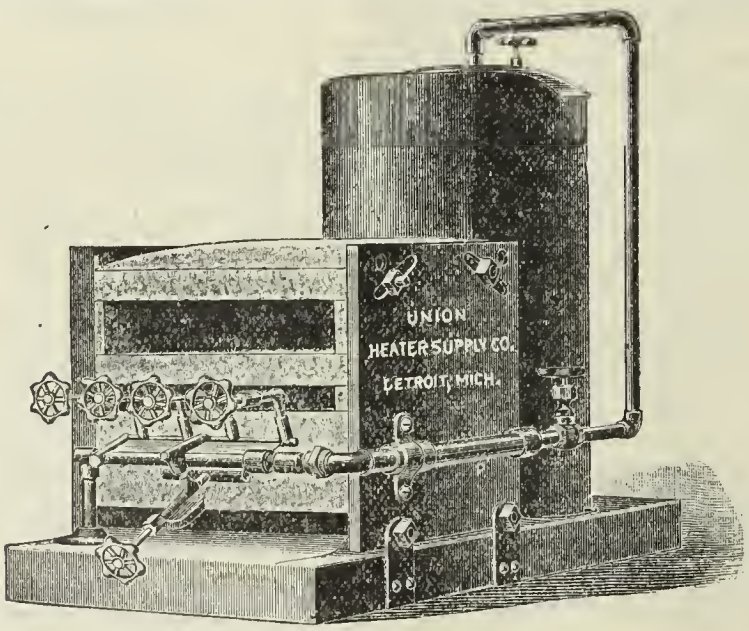

Fig. 2.—The Star Combination Wrench.

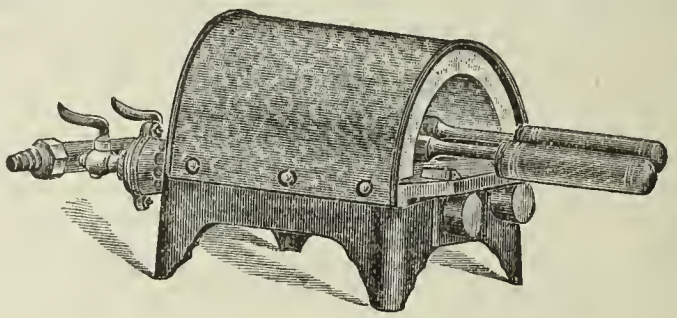
lengths from 6 to 48 inches, to take pipe from ⅛ inch to 5 inches in diameter. The combination wrench, Fig 2, is referred to as simple in construction, strong, durable, and as entirely free of springs. It is claimed that it is interchangeable in all its parts, and that it cannot slip, lock, or mash the pipe. The wrench is designed for nuts, couplings and pipe, for the use of plumbers, gas fitters, machinists, engineers, and for every branch of the mechanical trade where a wrench is used. The tool is made 10 and 14 inches long, to take from ⅛ inch to 1½ inch pipe.

Tool Dresser.



The Union Heater Supply Company, 90 Congress street, Detroit, Mich., make a specialty of gasoline apparatus for mechanical purposes, and one of their tool dressers is shown in the illustration herewith. It is designed to take the place of a forge for heating tools for dressing, tempering and annealing. It occupies but little space, can be readily transported to the work, is clean, and after the fuel tank is filled and the air pressure applied a steady flame is always ready immediately on opening the burner needle valve. The opening for the insertion of tools for heating is 8 inches wide, 2 inches high and 6 inches deep.

Tool Dresser.

Gas Soldering Iron Furnace.

The accompanying illustration shows a general view of a new gas soldering iron heater that has just been brought out by A. Weiskittel & Son, Baltimore, Md. The manufacturers allude to the present demand for a heater of this kind on account of the requirements of the insurance companies. The furnace is designed with a view to give the greatest heat with the least consumption of gas. It has two burners controlled by separate cocks, as shown in the illustration, so that one or two soldering irons can be heated at a time, as desired. The hood or top is made of semi-circular fire brick covered with sheet iron, which holds the heat and increases the efficiency of the burners. The device is sold at a reasonable figure, and the trade are requested to write for prices and circulars.

Gas Soldering Iron Furnace.

A trial of a Harveyized steel armor plate, manufactured by John Brown & Co. of Sheffield took place on February 12, at Portsmouth, England. The plate was selected by the Admiralty authorities from a batch of plates forming one of the barbettes of the new British battle ship "Magnificent," now building at Chatham, and had been reduced to the following dimensions: 8 feet in length, 6 feet in width, and 6 inches in thickness. Four 6 inch Holtzer projectiles were fired against the plate, with the velocities of 1507 feet, 1815 feet, 1960 feet, and 1815 feet per second respectively. All the projectiles were completely broken up, fragments of the third shot alone succeeding in just perforating the plate and lodging in the backing. The penetration in the other cases was estimated at from 2 inches to 4 inches. The trial was considered very satisfactory, the behavior of the plate being almost identical with that of the original test plate manufactured by Brown & Co., and tested in February, 1894.

As an illustration of the rapid introduction of the basic open hearth in this country, it is stated that the cargo of dead burnt Styrian magnesite received by the Fayette Mfg. Company on the steamship "Alsatia," arriving on February 15, was all sold three weeks before the arrival of the vessel. The above company have made arrangements for the receipt of this material every month, which insures fresh material and prompt shipments. This dead burnt magnesite is ground and prepared for bottoms and repairs, and is in a convenient shape for storing and using, there being no loss in transportation or handling. In the items of labor and refractories it has been shown that the small manufacturer with two open hearth furnaces using prepared magnesite is on the same basis as a larger manufacturer with a larger number of furnaces using magnesite or dolomite.

Herr Joseph Treitl, an ironmonger, of Vienna, who has just died at the age of 91, has left 800,000 florins to the Vienna Academy for the promotion of scientific research.

A very marked revival is reported in the lumber business in Tennessee, where a number of manufacturing concerns have started into operation after long seasons of idleness, and others are preparing to start.

TRADE REPORT.

The Iron Market.

Pig Iron.—There has been no change in the situation in the New York market. Consumers are melting a fair amount of Iron, but are still buying cautiously. We quote $12 @ $12.50 for No. 1; $11 @ $12 for No. 2, and $10.50 @ $11 for No. 2 Plain, standard brands, tidewater delivery. Southern Iron, same delivery, is selling at $11.25 @ $11.50 for No. 1; $10.25 @ $11 for No. 2; $10 @ $10.50 for No. 3; $10.25 @ $10.75 for No. 2 Soft, and $10.50 @ $10.75 for No. 1 Soft. Foundry No. 4 (Foundry Forge) is $9.50 @ $10.

The Pig Iron market in the Philadelphia district is reported as very quiet, and although the aggregate tonnage is considerable, it is taken in such a way that it is hardly noticed. Small orders frequently renewed appears to be the fashion, except when some special inducements are offered, which at the present low prices cannot be very often. The impression gains ground that higher prices for Coke and Ores are among the probabilities for the near future, but as yet it has had no influence either on producers or consumers. The former accept orders at the old figures for almost any quality that a buyer will take, while the consumers appear just as little inclined to increase their orders as they have been for months past. Sales in moderate quantities at about the following prices for Philadelphia, and from 20¢ to 30¢ less for water delivery, or at points such as York, Harrisburg, &c.:

Standard No. 1 Foundry X	$12.00 to $12.50
Standard No. 2 Foundry X	11.00 to 11.50
No. 2 Plain	10.75 to 11.00
No. 1 Soft	11.50 to 11.75
No. 2 Soft	10.75 to 11.00

Business in the Chicago Pig Iron market shows some improvement over the previous week. The sellers of local Irons have been particularly favored in transactions. Quite a number of sales are reported, the largest calling for 1500 tons. Southern Iron represents a much smaller quantity, the sales all told amounting to about 1000 tons. Lake Superior Charcoal has been quiet, with very little doing outside of carload lots. No changes have been made in prices, the quotations on local Irons being unaffected by the recent cuts in Southern brands. Quotations are as follows for cash:

Lake Superior Charcoal	$13.00 to $14.00
Local Coke Foundry, No. 1	10.25 to 10.50
Local Coke Foundry, No. 2	9.75 to 10.00
Local Coke Foundry, No. 3	9.50 to 9.75
Local Scotch	10.50 to 11.00
Ohio Strong Softeners, No. 1	12.50 to 13.00
Southern Silvery, No. 1	11.50 to 11.75
Southern Silvery, No. 2	11.25 to 11.50
Southern Coke, No. 2	10.00 to 10.50
Southern Coke, No. 3	9.75 to 10.25
Southern, No. 1, Soft	10.25 to 10.50
Southern, No. 2, Soft	9.75 to 10.25
Alabama Car Wheel	17.50 to 18.00
Jackson County Silvery	15.50 to 16.00
Other Ohio Silvery	14.25 to 14.50

Production in the Pittsburgh district continues very heavy, and some of the stacks are making exceptionally good records in production. In Foundry Iron the situation is unchanged. The demand is fair, and prices are about as they have been for several weeks past. We quote as follows:

No. 1 Foundry	$10.50 to $10.65 cash.
No. 2 Foundry	9.65 to 9.75 "

In the Cincinnati district contracts, ranging between 1000 and 2000 tons for delivery running through several months, have been offered to Southern furnaces at a shade under quotations, but with the increased business in sight producers are disposed to adhere even more closely to their views of a turn for the better soon, and all offers under the previously current rates have been refused. Northern Charcoal Iron, too, is meeting a better demand with some large trades pending at the moment. Western Pipe works and radiator manufacturers have been among the recent buyers, and Eastern Pipe works are said to be contemplating contracting for round amounts. There is also evidence that small buyers, while not anticipating their wants, to any great extent at least, are not running so close to shore as during the past few months, and as a result there may be less complaint regarding shipments. Quotations are given as follows:

Southern Coke, No. 1	$9.75 to $10.00
Southern Coke, No. 2	9.00 to 9.25
Southern Coke, No. 3	8.50 to 8.75
Ohio Soft Stone Coal, No. 1	14.50 to 15.00
Ohio Soft Stone Coal, No. 2	14.00 to 14.50
Lake Superior Coke, No. 1	11.75 to 12.25
Lake Superior Coke, No. 2	10.75 to 11.50
Hanging Rock Charcoal, No. 1	16.00 to 16.50
Hanging Rock Charcoal, No. 2	15.50 to 16.00
Tennessee Charcoal, No. 1	13.00 to 13.50
Tennessee Charcoal, No. 2	12.00 to 12.50

The conditions governing the St. Louis Pig Iron market are practically the same as last reported. Sales have dwindled down to carload quantities with an occasional 100-ton lot. There seems to be a fair consumption, but there is not much inquiry for Iron for future wants. Furnacemen seem to believe that prices at present ruling are as low as they can possibly go and are not pushing sales to any extent, preferring rather to wait and secure the advantage of advance of price, no matter how small. No. 2 Foundry continues to be quoted at $6.75, f.o.b. cars Birmingham. The starting up of two of the local Stove foundries will help increase the consumptive demand. We quote as follows for cash, f.o.b. cars St. Louis:

Southern Coke, No. 1 Foundry	$10.00 to $10.25
Southern Coke, No. 2 Foundry	9.50 to 9.75
Southern Coke, No 3 Foundry	9.00 to 9.25
Southern Car Wheel	16.00 to 16.50

Metal Market.

Pig Tin.—The sharp turn upward mentioned in our last week's report has been followed by an almost unbroken decline and shrinkage in wholesale prices, making a weak and depresed market. Probably 300 tons have changed hands in a speculative way and the average quantity has passed into final channels of distribution and into consumers' hands. The downward course of values may fairly be attributed to the natural influence of excessive supplies, assisted by comparatively unopposed "bear" operations of prominent traders. Importations have been heavy, bringing the total for this month to date up to 2307 tons and adding several hundred tons to the spot stock. There are now about 1700 tons afloat, and it is probable that importations will exceed deliveries during the next 30 days. Straits Pig in small retail parcels is quoted at 15¢ @ 15½¢ ℔ lb, the lower figure being the most common.

Copper.—At the lower level of prices established of late there has been more business in Ingots, chiefly purchases by home consumers, deliveries running the next two months. Ingot was offered in large lots at as low as 9.50¢ for delivery during the summer months, but without developing much buying interest. This indication of weak undercurrent to the market is not the only one. Home consumers are extremely conservative, at all events. Export trade prospects are by no means flattering, and production is proceeding at a rate that doubtless causes more or less extensive accumulation of stock in first hands. Jobbers' price for small lots of Lake Ingot from stock is about 10½¢ ℔ lb.

Sheet Copper.—A moderate volume of inquiry is noted; but, although the feeling among consumers is regarded as better, the actual amount of buying is in the aggregate below par. Small lots of Sheet Copper are quoted by jobbers at 14¢ ℔ lb, net.

Pig Lead.—There have been forced sales of a few carloads of Common Domestic, under the influence of which the price went down with very slim results in the way of business. As thus tested, the market is a weak one for sellers. Large consumers seem disinclined to purchase here or in the West except at a lower level of values, and the smaller ones are buying in a hand to-mouth way only, pending developments. As for speculative interest, there appears to be none aside from remnants of old deals. American in small lots from store is quoted at 3⅞¢ @ 3¼¢ ℔ lb.

Lead Pipe and Sheet.—No tangible improvement is to be recorded in the demand for manufactured Lead. Buying is still in the nature of small purchases for present needs alone. Prices in this section are maintained at the list rate, namely, 5½¢ for Pipe and 6½¢ for Sheet, with 20 % discount.

Spelter.—No improvement in the volume of business or in the demand has taken place here. The larger movement is still almost wholly on orders calling for a few carloads at a time or single carloads, and the demand is wholly bare of spirit. Jobbers also report a very tame demand for small parcels, for which they quote 3¾¢ @ 4¢ ℔ lb for Western brands.

Antimony.—The jobbing trade has been fair, but the movement otherwise is still light. Prices remain at about 8¢ for Hallett's and 9½¢ for Cookson's, in small lots from store.

Nickel.—Sellers quote at about 35¢ @ 40¢, according to size of lot.

Tin Plate.—Coke Plates for forward delivery have been the only really redeeming feature of the market during the week. These have met with very fair sale, the requirements of canners in

some quarters being imperative. Spot sales of the same have also been somewhat better. However, the entire dealings are doubtless of very moderate average for this season of the year, and have not been of sufficient magnitude to put any backbone into prices, which still remain somewhat weak and irregular. Bright Charcoals are selling in moderate quantities only, and the demand for Ternes has been greatly restricted throughout the country by the severe weather and the general condition of the roads, &c. The outlet for Ternes is supplied almost wholly by American mills. Advices of severe depression on the other side, accompanied by heavy failures in the Tin Plate trade and the consequent closing down of works, has induced the impression that the restricted production resulting may bring about a stiffening in prices. But the late starting into operation of a strong force of American works is likely to neutralize this.

The condition of the British Tin Plate market is thus described in a special London cable dispatch of February 27 to *The Iron Age:* Tin Plate has continued slow. Transactions limited to small lots, chiefly for Russia and 'Frisco. Only a moderate forward business has been done. Quotations, f.o.b. Wales, are as follows:

Bessemer Cokes, IC 14 x 20	9/	@ 9/1½
Siemens Cokes, IC 14 x 20	....	@ 9/4½
Ternes, 20 x 28	18/	@ 23/
Charcoals, IC 14 x 20	10/6	@ 13/

Sheet Iron.—Spot business in both Black and Galvanized Sheets is quiet, but a large number of orders are being placed with mills for deliveries extending over the next three months. Some makers are, however, refusing to book orders very far ahead at present prices. The demand for light Black Plate for tinning purposes is referred to as excellent. Prices on both Black and Galvanized Iron exhibit no improvement, however. Jobbers' quotations for small lots of No. 27 Common Iron from store rule at about 2.65¢. Galvanized Sheets in similar quantities are quoted at the discount of 75 and 5 % @ 75 and 10 % off.

The United States Geological Survey, C. Kirchhoff, agent, has issued the following preliminary statement of the production of Spelter, the unit being the short ton of 2000 pounds:

Production of Spelter.

States.	1894.	1893.	1892.
Eastern	7,400	8,802	9,582
Southern	1,576	3,882	4,913
Illinois and Indiana	28,972	29,596	31,363
Kansas	25,388	22,815	24,715
Missouri	11,992	13,737	16,667
Totals	75,328	78,832	87,260

A partial statement of stocks shows that stocks increased from 4562 tons on January 1, 1894, to 4911 tons on January 1, 1895.

Chicago Report.

Scrap.—Everything has been quiet the past week. Dealers quote their buying prices as follows, Chicago delivery:

	Per net ton.	Per lb
No. 1 Wrought Scrap	$6.50	....
Machinery Cast	5.50	....
Malleable Cast	5.00	....
Stove Plate (free of burnt)	4.00	....
Burnt Iron and Grate Bars	3 00	....
Sheet Iron and Hoops	2.00	....
Plow Steel and Breaking Stock	4.00	....
No. 2, such as Shovels, Hoes, &c	3.00	....
Old Boilers—whole (Iron)	3.00	....
" (Iron)—cut in single Sheets and Rings	5.00	....
Old Gas-Pipe and Boiler Tubes	5.00	....
Cast Borings	3.00	....
Turnings	4.00	....
Horseshoes	7.50	....
Copper Bottoms	....	6 ¢
Copper Clips and Heavy	....	7 ¢
Heavy Brass	....	6 ¢
Light Brass	....	3 ¢
Pipe Lead	....	2½ ¢
Tea Lead	....	2 ¢
Zinc	...	2¼ ¢
Rubber	..	4 ¢

Anthracite. — Business has again lapsed into dullness. Carload lots of 12 net tons or over are quoted as follows, although some concessions are now being made:

	Grate.	Egg, Sto. and Ch.
Chicago, Ill	$4.75	$5 00
Milwaukee, Wis	4.75	5.00
Kansas City, Mo	7.95	8.20
Council Bluffs, Iowa	7.95	8.20
Lincoln, Neb	8.10	8.35
Sioux City, Iowa	7.95	8.20
Aberdeen, S. Dak	8.00	8.25
Dubuque, Iowa	6.05	6.30
Madison, Wis	6.25	6.50
St. Paul, Minn	7.25	7.50
Burlington, Iowa	6.25	6.50
Des Moines, Iowa	7.75	7.95
Davenport, Iowa	6.05	6.30
St. Joseph, Mo	7.95	8.20
Leavenworth, Kan	7.95	8.20
Omaha, Neb	7.95	8.20

Colorado Anthracite.

COLORADO FUEL & IRON COMPANY.

Denver	$8.00
Pueblo	8.00
Colorado Springs	8.00
Leadville	8.00
Cheyenne, Wyo	10.00
All points between Denver and Missouri River	8.85

CONDITION OF THE

Hardware Trade.

AS FEBRUARY draws to a close some houses report a gratifying increase in the volume of business, while with others trade does not yet manifest marked improvement. Travelers, however, are quite generally on the road, and the result of their efforts is the securing of a number of orders, which for the most part are carefully assorted and not specially large. They, however, in the aggregate undoubtedly cover considerable quantities of goods, and are sufficient to meet the immediate requirements of the purchasers. Both retailers and jobbers are apparently disposed to let the manufacturer carry the stocks from which purchases are to be made as necessary. Prices do not show any material change, and the market continues in a somewhat unsettled condition. Collections are fairly good.

Advices from Chicago.—Shelf Hardware has been affected to a considerable extent by the milder weather. Orders have been very much more numerous within the past four or five days, and the character of goods now in demand shows that outdoor work has begun to be prosecuted with some vigor. Important sections of the Northwest are still ice bound and it will be some little time before general outdoor work is in full swing. The trade has not yet recovered from the demoralization of Wire Nail prices by Chicago jobbers, and this matter will, perhaps, have to be settled before trade gets into a thoroughly satisfactory condition. The outlook continues to improve steadily, however, and jobbers here are looking forward to an excellent month's business in March. The Heavy Hardware trade shows some falling off in consequence of the change from winter weather and the diminished demand for winter goods. Collections have improved.

Notes on Prices.

Wire Nails.—Considering the disturbance which results from the active competition between two of the leading jobbing houses, the Wire Nail market continues in excellent condition, and most of the manufacturers are firmly holding to the advanced prices which for the past week or two have been ruling. There is a good deal of inquiry and negotiation, and a good many orders have been placed. As a result the mills are well occupied for some time to come.

Advices from Chicago.—Large orders have recently been placed by outside jobbers who evidently believe that this is a good time to secure aditional stock for their spring trade. Inquiries are growing better as manufacturers are seen to maintain a firm stand. The carload price has recently been advanced to $1.05 Chicago by manufacturers. This is 10 cents per keg higher than quotations made by two Chicago jobbing houses, who continue to maintain the fight which has been in progress here for the past several weeks. It is claimed that the end of this fight is now drawing near, as their contracts with mills are rapidly being taken out.

Cut Nails.—There has been only a moderate movement in Cut Nails the past week, but the mills report more frequent inquiries and refer to the indications of a fair business as the spring opens. Quotations are unchanged. Small lots from store, in New York, are held at 85 to 90 cents.

Advices from Chicago.—Manufacturers report very little trade in progress. Jobbers quote small lots at $1 from stock.

Barb Wire.—The Barb Wire market is steady, with an increasing volume of business. There is little doubt that the situation would be more completely satisfactory were it not for the disposition on the part of some of the jobbing houses who have large orders in at relatively low figures to undersell the prices which the manufacturers are now disposed to maintain firmly. Small lots of Four-Point Galvanized from store are held at $2.10 to $2.15.

Advices from Chicago.—Manufacturers are enjoying a good trade from many parts of the West and their business steadily improves as milder weather penetrates to more Northern districts. They expect to do a much larger business in March than ever before. The Chicago jobbers who are making low prices on Wire Nails also quote $1.55 for Painted and $1.90 for Galvanized. Small lots from stock are quoted at $1.65 for Painted and $2 for Galvanized.

Pneumatic Pump.—The Pneumatic Wall Pump put on the market by Hulbert Bros. & Co., 26 West Twenty-third street, New York, is sold to the trade at $18 net.

Lawn Mowers.—We are advised by S. A. Haines, who represents the Dille & McGuire Mfg. Company, Richmond, Ind., as manager of sales, that about March 20 they will advance their prices about 10 per cent. They refer to having largely oversold the production of any former year, and make this advance in view of the unnecessarily low prices now ruling on Lawn Mowers.

Glass.—The meeting of the Glass manufacturers held at Columbus, Ohio, on the 21st inst. did not result in any definite action being taken, but was

adjourned to meet at Pittsburgh on February 28. The condition of the market remains unchanged since our report last week, both in regard to prices and demand; while jobbers and manufacturers are awaiting anxiously the developments of the coming spring. New York quotations for American Window Glass in small lots are as follows: Single Strength, 85 and 10 to 85 and 15 per cent. discount; Double Strength Glass, 85 and 20 per cent. discount.

Old Metals.—The demand is still quite moderate, but there are indications of a recovering interest in some quarters which point to probable improvement in business in this line within a reasonable period. Some good orders have been taken by Scrap Iron dealers for certain qualities of Old Iron. Prices show no quotable change, the following quotations representing about the current rates paid by dealers in this city:

Heavy Copper	₱ lb 7 ¢
Light and Tinned Copper	₱ lb 6½¢
Heavy Brass	₱ lb 4¾¢
Light Brass	₱ lb 3¾¢
Lead	₱ lb 2¾¢

No. 2 Bagging	₱ lb ½ @ ¾¢
Hemp Twine	₱ lb 2 @ 2¼¢
Manila Rope	₱ lb 2 @ 2½¢
Jute Rope	₱ lb 1½ @ 1¾¢
Mixed Rope	₱ lb ¾ @ ⅞¢

Old Rubber.—The following quotations represent about the prices paid by dealers, New York delivery:

Car Springs, ton lots, ₱ lb	$0.03¾ @ .04
Rubber Shoes, carloads, delivered at factory, ₱ lb	@ .05¼
Rubber Shoes, less than carleads, ₱ lb	@ .04¾
White Wringer Rolls, ₱ lb	@ .03⅞
White Syringes, ₱ lb	@ .03⅞

THE QUICK SHINE COMPANY, St. Louis, have placed on the market a stove blacking which bids fair to prove popular from the fact that it not only blackens the stove but will also polish the nickel. The polish is put up in tin boxes with an attractive label and is advertised as "the best on earth." The mode of operation is to apply it with a damp woolen cloth and rub the parts to which the polish has been applied with a dry cloth. The Donnell Mfg. Company, 612 South Sixth street, St. Louis, Mo., are the distributing agents.

Trade Notes.

THE JOEL HAYDEN BRASS WORKS, at Lorain, Ohio, owned by the United States Brass Company of Connecticut, was sold by the sheriff last week. The appraised value of the plant and 60 acres adjoining was $185,000. The property brought $141,000. The purchasers were Hon. H. S. Hoyt, Charles F. Matthewson and Edgar Woodman, trustees of the bondholders.

THE MUTUAL GAS SAVING COMPANY, for utilizing a patented invention for saving gas, has been incorporated st Bsltimore, Md., by Henry S. Cunnare, Cooper Lyons, John J. Myers, John A. Blondell and Michael A. McCormick, with a capital stock of $50,000.

THE NEW YORK STAMPING COMPANY of Brooklyn received a charter of incorporation this week. The company, whose capital is placed at $30,000, will manufacture metal goods. Directors are James Edgar and W. A. Bardell of Brooklyn, and J. F. Pierson of New York City.

THE LOS ANGELES IRON & STEEL COMPANY of Los Angeles, Cal., recently placed an order for 600 tons of steel billets at Pittsburgh, Pa., to be used in the manufacture of Light Plates and Sheets.

A. C. DALLAS & Co, 79 Lake street, Chicago, have been appointed Western agents for the Benedict & Burnham Mfg. Company, manufacturers of Seamless Brass and Copper Tubes, Brszed Tubes, Sheet Brass, Rods, &c.

FERD. BLEMLY, 151 Fulton street, New York, makes a specialty of fine metal chasing. He is now completing a set of fine brass patterns for a fireplace lining and borders to match. He also does mold making, die sinking, and makes steel, brsss and rubber stamps.

THE WORKS of the Chicsgo Pipe Company, New Philadelphia, Ohio, were burned down on February 28. The loss is estimated at $100,000, partly covered by insurance.

ALUMINUM AND ALLOY METAL WORKS of Peru, Ind., have been incorporated, with a capital stock of $45,000. The directors are James O. Cole, R. A. Edwards, C. C. Emswiller, R. H. Bouslog, W. J. Wilder, L. B. Jenks.

EVEN those who are not in any way interested in buying Ice Cream Freezers should turn over our advertising psges to the announcement of the S. C. Tatum Company of Cincinnati, Ohio, for the pleasure of seeing the three Ethiopians eat ice cream made in the Ohio Freezer.

AMONG the special advertisements to be found in this issue of *The Metal Worker* is one giving a list of tinners' supplies and tools together with the prices. It is a special sale and any tinners or others having use for such materials and machines will be interested in the sale.

The statistics of metallurgical production in Belgium in 1894 show that the amount of pig iron manufactured was 810,940 tons, being an increase upon the previous year of 65,676 tons. Rails and sheets amounted to 122 474 tons, as against 118,602 tons in 1893, and other iron 330,917 tons, as compared with 371,119 tons. The production of steel ingots in 1894 was 396,914 tons, as agsinst 273,113 tons, snd steel rails, sheets, &c., 344,766 tons, as compared with 224,622 tons.
